   "The syntactical and semantical investigations in contemporary formal logic refer always to the languages with specified syntactic structure, as with respect to such languages one can formulate exactly and, subsequently examine with mathematical tools 1) the rules of transformation (axioms, rules of inference) and the systems based on these rules (formalized theories), 2) the relations of semantical reference which occur between linguistic expressions and elements of objective sphere.

   Our considerations belong to that part of logical syntax and semantics which is independent of any assumptions concerning the rules of transformation.

   The syntactic structure of some language *L* is determined 1° by the *vocabulary* of *L* i.e. by the list of simple (undecomposable) expressions in *L,* and 2° by the *rules of construction L* of which state how the expressions of *L*', especially the sentences in *L* are built of simple expressions.

   In the first part of this paper we consider the general principles of the syntactic structure of languages. Namely, we shall formulate a scheme of the syntactic structure of language. This scheme will he called the *standard formalization* and the languages which fall under this scheme will be called the *standard formalized languages* (1).

   The scheme of standard formalization is based on a purely syntactical classification of expressions into so called *semantical categories.*

   The standard formalization is an abstract from the concrete material of artificial symbolic languages which are considered in formal logic. It is general in the following sense: every symbolic language known in formal logic - after carrying some modifications in its calligraphy -- falls directly under the scheme of standard formalization.

In the second part of this paper we consider the fundamental properties of semantic reference. First, we introduce a classification of objects into so called *ontological categories*. Further making use of some simple and quite natural connexion of conformity between semantical categories of simple expressions and ontological categories of corresponding objects, we can introduce the general notion of a *model* of any standard formalized language. Namely, for every standard formalized language *L* we define the family M(*L*) of all models of *L*. Every model of *L* is a totality to which the expressions of *L can* refer semantically and, conversely, every totality to which the expressions of *L can* refer semantically, belongs to the family M(*L*). Thus, we obtain a general scheme of the relations of semantical reference which is quite closely connected with the scheme of standard formalization. This shows the ideographic character of standard formalized languages.

It may be a reasonable conjecture the content of this paper to be connected with the structural inquires in linguistcs and with some problems of the philosophy of language and of thinking. But, we do not discuss here these connexions." pp. 213-214.

"§ 9. *Introductory remarks concerning the relation of semantical reference.*

We begin the considerations about semantics of standard formalized languages with some general remarks belonging to the theory of signs or semiotic in the sense of Ch. Morris [1938].

We consider the languages as systems of signs participating in the process of communication between persons belonging to some human group (speech community). Communicative

employment of linguistic signs in some group is intertwisted into the whole of activity of members of this group and of their relations to the environment, and the connection between the employment of linguistic signs and the activity of persons of the given speech community grants an intersubjective meaning to the employed signs.

The considerations about signs and languages may be conducted from a historical and descriptive point of view as well from systematical and theoretical one. On the other hand one can distinguish in these considerations three following ranges: syntax, semantics and pragmatics [Morris 1938]. The syntax deals with the relations which do occur between the signs alone. The principles of combination of simple signs into the composite signs are considered by it. Generally speaking with the syntax it is investigated the syntactic structure of languages. Semantics deals with the relations of semantical reference of signs to objects belonging to the objective sphere. These relations bind the signs with that *about what the signs in the process of communication are speaking*. Finally, pragmatics take into account the role of persons employing the signs.

One may say that the division of the science of signs and languages into syntax, semantics and pragmatics is made from the point of view of formal logic. Namely, pragmatics is strictly connected with the psychology, sociology, history of culture and other sciences dealing with members of speech communities. On the contrary the considerations about linguistic expressions conducted in formal logic are included in the syntax and semantics.

If a language *L* of some syntactic structure is meaningful in some circumstances (i. e. the expressions of *L* are participating in the process of communication in some human group) then the language *L* - as a system of expressions - semantically refers to some complex *R* of objects which may be called the referent of the whole language *L* in the given circumstances of meaningfulness of *L*. I think that the existence of this referent *R* and the occurence of the relations of semantical reference

between the language *L* and the referent *R* (and between the expressions of *L* and fragments of *R*) is a basis of the intersubjective meaning of expressions of *L*. On the other hand the syntactic structure of the language *L* depends 1°) on the referent *R* and 2°) on the members of the given speech community; *the principle of the dual control of linguistic structure,* [1938] p. 12.

In the case of formalized languages the situation is much more simple. Firstly, in formal logic we abstract from pragmatical properties and relations of linguistic expressions. In formal logic we consider only the syntactic structure of languages and the relations of semantical reference. Therefore, instead of the referent of a given formalized language *L* (in the given circumstances of its meaningfulness) we consider here the family of all possible referents of *L* which are called *models* of *L* and the principle of dual control mentioned above is reduced to the connection between the syntactic structure and the common structure of all models of *L*. This is *the connection of conformity of semantical categories with the ontological categories*. It will be explained later.

We do not intend here to prove the connection of conformity of categories. It will be enough to remark that this connection is fulfilled in all semantical interpretations of artificial symbolic languages considered in formal logic. We take in our paper the connection of conformity of categories as a fundamental principle by which are characterized the formal properties of relation of semantical reference and, consequently, it is possible to determine the family of all models of any given standard formalized language." pp. 63-64.

17. ———. 1968. "Ontology in the *Tractatus* of L. Wittgenstein." *Notre Dame Journal of Formal Logic* no. 9:7-33.

    "The Tractatus Logico-Philosophicus of Ludwig Wittgenstein is a very unclear and ambiguous metaphysical work. Previously, like many formal logicians, I was not interested in the metaphysics of the Tractatus. However, I read in 1966 the text of a monograph by Dr. B. Wolniewicz of the University of Warsaw2 and I changed my mind. I see now that the conceptual scheme of Tractatus and the metaphysical theory contained in it may be reconstructed by formal means. The aim of this paper* is to sketch a formal system or formalized theory which may be considered as a clear, although not complete,

reconstruction of the ontology contained in Wittgenstein's Tractatus.

It is not easy to say how much I am indebted to Dr. Wolniewicz. I do not know whether he will agree with all theorems and definitions of the formal system presented here. Nevertheless, I must declare that I could not write the present paper without being acquainted with the work of Dr. Wolniewicz. I learned very much from his monograph and from conversations with him. However, when presenting in this paper the formal system of Wittgenstein's ontology I will not refer mostly either to the monograph of Dr. Wolniewicz or to the Tractatus. Also, I will not discuss here the problem of adequacy between my formal construction and Tractatus. I think that the Wittgenstein was somewhat confused and wrong in certain points. For example, he did not see the clear-cut distinction between language (theory) and metalanguage (metatheory): a confusion between use and mention of expressions."

    "The notion of quasi-completeness (or O-completeness) has been introduced by J. Los [1], [2] into the semantics of theories in open languages with nominal variables. An analogous notion known as Hallden-completeness [3], [4] is applicable to sentential logics. Both notions are of the same formal nature and can be uniformly treated when formulated with respect to W-languages which contain two kinds of variables, sentential and nominal, as well. W-languages considered here are open, that is, not containing bound variables. The aim of this paper is to show that the main theorems of Los concerning the quasi-completeness also hold in non-Fregean logic and semantics.

    The author is indebted to Dr. Stephen L. Bloom from Stevens Institute of Technology for comments on the first draft of this paper."

    "The SCI (Sentential Calculus with Identity) is obtained from the classical sentential calculus by the addition of 1° a new binary connective, the identity connective (denoted by =) and 2° axioms which 'say' that = means "p is identical to q" (also: "the situation p is the same as the situation q"). The new axioms are the weakest possible; no presuppositious about the meaning of "is identical to" are included (other than p = p). We do not attempt to say what the range of the sentential variables p, q, r, ... is. (In the classical propositional calculus, they are intended to range over a two element set.) In this paper, a number of results about the semantics of the SCI are given without proof. The proofs of these and other results are contained in the much longer Investigations into the Sentential Calculus with Identity."

    English translation by Oligierd Wojtasiewicz of an article published in Polish in 1957.

    "The antinomy of the liar has been discussed many times in formal logic. It is associated with remarkable advances in logic: the formulation of the semantic theory of truth [4] and the discovery of undecidable statements and the impossibility of proofs of consistency under specified conditions ([2]; see also [3], Vol. II, pp. 256ff).

    All those results make fundamental use of *self-referential expressions,* which were first used, in the history of logic, in the antinomy of the liar. The aim of this paper is to demonstrate, by quite elementary methods; something that has been known

since the birth of semantics, namely, that the concept of truth and other semantic concepts are relative in nature [5] and that using relative semantic concepts, including the construction of self-referential expressions, does not result in antinomies in natural language.

Semantics, and in particular the semantic theory of truth, presupposes syntax. The wealth of semantic analysis thus depends on the wealth of syntactic information about those expressions to which semantic analyses refer. Since in this paper no systematic syntactic studies on the structure of expressions are made, except for the construction of self-referential expressions, the set of concepts used in the semantic theory of truth discussed here is very modest.

(...)

The semantic theory of truth does not result in the antinomy of the liar if we use concepts restricted to a set of statements which does not include statements from the theory of truth which we are studying in a given case.

It can be shown that the same applies to other parts of semantics, namely those in which the other semantic concepts (denoting, satisfying, etc.) are used [4], [5], [6].

To do this it suffices to analyse other antinomies constructed with the aid of semantic concepts, and to modify them in a manner analogical to that applied above in the case of the antinomy of the liar.

The semantic concepts which we can use in semantic research without being involved in antinomies are relative (restricted). They have a certain reference to a type *L* of expressions, which includes neither those semantic terms which have a reference to *L,* nor statements containing those semantic terms. Within those semantic analyses in which we use semantic concepts restricted to type *L* of expressions we can construct, in accordance with general syntactic rules, an expression which can be proved not to be of type *L*. The proof consists in a reasoning which changes into an appropriate antinomy if the

restrictive reference to *L,* applied to the semantic concepts used in that case, is disregarded."

English translation by Olgierd Wojtasiewicz of an article published in Polish in 1966.

"Russell's antinomy of the class of normal classes, i.e., the class of those classes which are not their own elements, emerged when the current concept of class was being given more precision. It is this current concept of class which is blamed for Russell's antinomy.

The task of the present paper is to offer a fairly precise definition of the current concept of class, which has subsequently come to be split into the collective (concretistic) concept of class and the distributive (mathematical) concept of class or set. S..Leśniewski's mereology, to which T. Kotarbinski's concretism refers, is a theory of classes in the

collective sense. The theory of classes in the distributive sense has taken the form of mathematical set theory, which originated with E. Zermelo; other versions of the theory of classes in the distributive sense are provided by B. Russell's type theory and S. Leśniewski's Ontology.

After making the current concept of class more precise, which will consist in a systematization of the assumptions concerning that concept, we shall define normal and non-normal classes as well as the class of normal classes and the class of non-normal classes. Several variations of these definitions are possible, and Russell's antinomy can be reconstructed in each case. We shall see, however, that his antinomy cannot be reconstructed in current language, since the corresponding reasonings do not yield a contradiction. The thesis of this paper is that the current concept of class, as described below, is not self-contradictory."

    Co-author: Zdzislaw Kraszewski.

    English translation by Oligierd Wojtasiewicz of an article published in Polish in 1968.

    °We shall concern ourselves here with the transition from the current concept of class to the distributive (set-theoretical) and the collective (mereological) concept of class. This transition is linked to the concepts of normal and non-normal class. Preliminary remarks on that issue have already been made in Sec. 8.

    We assume here a non-existential axiom system for the current concepts of class and element, as described in Secs. 2 and 3. Consequence and equivalence are interpreted, as before, as consequence and equivalence in the light of that axiom system."

56. ———. 1994. "The Reification of Situations." In *Philosophical Logic in Poland*, edited by Wolenski, Jan, 247-270. Dordrecht: Kluwer Academic Publishers.

English translation by Theodore Stazeski of an article published in Polish in 1971.

"The great task of the theory of reification is to show in what way the so-called ontological assumptions of the structure of the universe of situations are transferred to events by reifications, and to impose an algebraic structure on them. Such an approach to the theory of reification flows from the earlier expressed opinion that situations are primary and events are derived. One should not confuse this point of view with the false opinion, I believe, that situations are primary in relation to all objects. It is an altogether different and difficult matter, and in this case a certain consultation of Wittgenstein would be very useful. But the fact that situations are primary in relation to their reification is rather natural. The abstract process, of which the formal expression is the reification of a situations, finds - I think - its fragmentary expression in ordinary language; I write `I think' since I enter into the competence of linguists. These examples given by Slupecki are an illustration. Thus, forest fire = reification of the situation that the forest is burning, and Matt's death = reification of the situation that Matt died. These examples do not give evidence that an explicit symbol of the reification of situations, corresponding to the star of Slupecki of our T, exists in natural language. They are examples giving evidence that the grammatical apparatus of a natural language can often, though certainly not always, transform sentences *p* (describing situations) into names *x* (designating particular events) such that *x* = T *(p),* and sentences containing those names. The opposite transformation is something unnatural, and is hardly taken into consideration by grammarians.

This observation obviously does not remove the most serious difficulties which appear in connection with situations. The principal difficulty appears at the moment of incorporation of non-trivial theories written in natural language with help of

(bound) sentence variables. Reading formulas appearing in this theory in natural language immediately raises serious doubts for many logicians with regard to sense or correctness. There are no such difficulties, or they are considerably less, in the reading of formulas with name variables (not sentential. It is probably the symptom of some deep, historical attribute of our thought and natural language, whose examination and explication will certainly be prolonged and arduous.

From the rather narrow point of view of formal logic the following considerations are suggested. The difference between a sentence and a name is not exhausted in their syntactical properties. A certain syntactic analogy even exists between the category of sentences and the category of names, which can stretch very far (for example the rules of operations for quantifiers are formally similar in the case of sentential and name variables). The difference between sentences and names appears first of all in that sentences, and not names, are subject to assertion, as well as that sentences are premises and conclusions in reasoning. These distinctions on the language level are transferred in some manner to that to which the sentences and names semantically refer. Semantical relation (reference), however, of sentences and names are also - formally - to a certain degree analogical.

Names designate and sentences describe. The difference in terminology (designate, describe) is not essential. The essential point is that we attribute reference to something both to names and to sentences, and that this, in the case of a given name and a given sentences, is exactly one; with the assumption, obviously, of a univocal sense of expression and with exclusion of mythological terms.

This analogy, however, is not complete, just like the analogy between sentences and names, with result that a categorial gap exists between that which a sentence describes (a situation) and that which a name designates (an object). The fact that the expressions $p = x$ and p x, where on the left we have a sentence and on the right a name, are not well formed formulas, shows this profound gap.

The analogies between situation and objects as well as that between sentences and names are not complete. But it does not stop at the level of the formation of sentences and names, not at the level of the formal operation on them in accordance with logic. What, therefore, is the cause that our thought and natural language discriminate sentence variables to a certain degree, and particularly, general and existential sentences about situations?

The above considerations about the reification of situations show that the theory of situations and the theory of events are, in certain manner, equivalent. Why, therefore, prefer the theory of events to the theory of situations?" pp. 249-250.

2. Beziau, Jean-Yves. 1999. "A Sequent Calculus for Łukasiewicz's Three-Valued Logic Based on Suszko's Bivalent Semantics." *Bulletin of the Section of Logic* no. 28:89-97.

   "A sequent calculus S3 for Łukasiewicz's logic L3 is presented. The completeness theorem is proved relatively to a bivalent semantics equivalent to the nontruthfunctional bivalent semantics for L3 proposed by Suszko in 1975. A distinguishing property of the approach proposed here is that we are keeping the format of the classical sequent calculus as much as possible."

Research report, CLC, Department of Mathematics, Instituto Superior Técnico, 1049-001 Lisboa, Portugal, 2003.

Presented at III World Congress on Paraconsistency, Toulouse, France, July 28-31, 2003.

"A well-known result by Wojcicki-Lindenbaum shows that any tarskian logic is many-valued, and another result by Suszko shows how to provide 2-valued semantics to these very same logics. This paper investigates the question of obtaining 2-valued semantics for many-valued logics, including paraconsistent logics, in the lines of the so-called "Suszko's Thesis". We set up the bases for developing a general algorithmic method to transform any truth-functional finite-valued semantics satisfying reasonable conditions into a computable quasi tabular 2-valued semantics, that we call dyadic. We also discuss how "Suszko's Thesis" relates to such a method, in the light of truth-functionality, while at the same time we reject an endorsement of Suszko's philosophical views about the misconception of many-valued logics."

7. Czelakowski, Janusz, and Pigozzi, Don. 2004. "Fregean Logics." *Annals of Pure and Applied Logic* no. 127:17-76.

   "The main results of the paper: Fregean deductive systems that either have the deduction theorem, or are protoalgebraic and have conjunction, are completely characterized.

   They are essentially the intermediate logics, possibly with additional connectives.

   All the full matrix models of a protoalgebraic Fregean deductive system are Fregean, and, conversely, the deductive system determined by any class of Fregean 2nd-order matrices is Fregean. The latter result is used to construct an example of a protoalgebraic Fregean deductive system that is not strongly algebraizable."

October 19-21, 1984, edited by Perzanowski, Jerzy, 191-196. Cracow: Jagiellonian University.

9. Golinska, Joanna, and Huuskonen, Taneli. 2005. "Number of Extensions of Non-Fregean Logics." *Journal of Philosophical Logic* no. 34:193-206.

   "We show that there are continuum many different extensions of SCI [sentential calculus with identity] (the basic theory of non-Fregean propositional logic) that lie below WF (the Fregean extension) and are closed under substitution. Moreover, continuum many of them are independent from WB (the Boolean extension), continuum many lie above WB and are independent from WH (the Boolean extension with only two values for the equality relation), and only countably many lie between WH and WF."

10. Lukowski, Piotr. 1990. "Intuitionistic Sentential Calculus with Identity." *Bulletin of the Section of Logic*:92-99.

    "The paper concerns the intuitionistic sentential calculus with identity IISCID, mentioned by professor R Suszko in his several papers. The work presents a semantics for ISCI, which combines the ideas of the matrix semantics for sentential calculi with the well-known Kripke-Grzegorczyk for the intuitionistic logic. Besides sketching a proof of the strong completeness theorem for ISCI, there are some straightforward connections between the new semantical construction and the modeling of SCI, i.e., the ordinary calculus with identity. The end of the work deals with a simplified version of the frame-matrix semantics for the intuitionistic logic without sentential identity."

11. ———. 1990. "Intuitionistic Sentential Calculus with Classical Identity." *Bulletin of the Section of Logic*:147-151.

    "Sentential calculus with identity /SCI/ has been created by Professor R Suszko. The discussion on SCI was a subject of many works. The intuitionistic weaking of this calculus /ISCI/ is presented in Pslukowski's "Intuitionistic sentential calculus with identity", Bulletin of the Section of Logic, 19, 3. In fact SCI is a classical propositional calculus with classical identity, while

ISCI an intuitionistic propositional calculus with intuitionistic identity. Thus in the present paper two strengthenings of ISCI, i.e., intuitionistic propositional calculus with classical identity /ISCI CI/ and classical propositional calculus with intuitionistic identity /SCI II/ are considered. There are also presented adequate semantics for both calculi."

12. Malinowski, Grzegorz. 1984. "Roman Suszko: A Sketch of a Portrait in Logic." *Studia Logica* no. 43:315.

13. ———. 1987. "Non-Fregean Logic and Other Formalizations of Propositional Identity." In *Essays on Philosophy and Logic. Proceedings of the Xxxth Conference on the History of Logic, Dedicated to Roman Suszko. Cracow, October 19-21, 1984*, edited by Perzanowski, Jerzy, 159-166. Cracow: Jagiellonian University.

    The aim of the paper "is to present Sentential Calculus with Identity in comparison with other formalizations of propositional identity."

    "Final remarks. It is evident that any comparative question concerning the logic of propositional identity may be posed either in reference to a particular language or to a special feature of a formalisation. Among several current requirements the three following seem to be of it particular importance:

    (1) Extensionality in the sense at Leibniz Law of indiscernibility of identicals.

    (2) Formal character of identity: nothing except general properties such as e.g. reflexivity, symmetry or transitivity has either be assumed or proved

    (3) Purely sentential character of formalisation: the language has to contain only sentential variables.

    (...)

    If one agreed that all the properties (1)-(3) are basic for the logic of propositional identity, SCI would be considered as the only genuine logic of this kind. [The property that logics of identity corresponding to S4 and S5 proved to be axiomatic

strengthenings of SCI, cf. [Bloom & Suszko 1972] and [Suszko 1971] supports the conclusion.]

    "*On semantic principles of Frege and non-fregean definition of the concept of propositional identity*. A non-fregean realization of the semantic programme of G. Frege elaborated by R. Suszko is one of the most interesting recent logical constructions. The aim of the paper is to present formal and philosophical aspects of the sentential calculus with identity, SCI, constituting the base of that realization."

15. Malinowski, Grzegorz, and Zygmunt, Jan. 1978. "*Review Of*: Roman Suszko - Abolition of the Fregean Axiom (1975)." *Erkenntnis* no. 12:369-380.

    "According to Professor Suszko's declaration on page 169, the main subject of his paper is the construction of non-Fregean logic (NFL) and its basic properties. To satisfy the reader's curiosity, we may say that NFL is generally speaking a result of the rejection of the Fregean axiom. This amounts to the following:

    (FA) *all true (and, similarly, all false) sentences describe the same, that is, have a common referent*.

    Before describing the content of the paper in some detail, we would like to draw the reader's attention to the facts that (1) the paper is concerned with the philosophy of logical constructions and the properties of logic but not with the proofs of theorems; (2) the paper is a survey in which the author presents his own

results as well as those of his colleagues. The presentation is against the broad background of the historical development of modern logic and recent research in possible world semantics, modal logics, intensionality and entailment, and all this is in order to strongly criticize 'that messy abyss with all its diffuse ghosts of ambiguity, vague flexibility, intensionality and modality' (cf. p. 171).

The paper under review consists of an introduction, 14 main sections, a supplement and a bibliography. The supplement contains 53 notes which provide us with deeper elaboration of some of the networks, comments, complements, sketches of proofs, etc. presented earlier. The bibliography, also containing 53 items, is not arranged alphabetically but in order of their citation in the main text, and includes the titles of almost all the important works by R. Suszko and his colleagues on non-Fregean logic - and in particular, sentential calculus with identity."

16. Metzler, Helmut. 1987. "Some Remarks on Roman Suszko's Discussion of the Frege-Axiom from the Point of View of Philosophy and Methodology." In *Essays on Philosophy and Logic. Proceedings of the Xxxth Conference on the History of Logic, Dedicated to Roman Suszko. Cracow, October 19-21, 1984*, edited by Perzanowski, Jerzy, 167-174. Cracow: Jagiellonian University.

    "Roman Suszko writes: "The semantical assumption that all true (and, similarly, all false) sentences describe the same, i.e. have a common referent (Bedeutung) is called the Fregean Axiom" (Suszko 1977, p. 377). He himself distinguishes in a strict way between logical and algebraic valuations of expressions of languages and speaks of an amalgamation into an inseparable unity of logical valuations (truth and falsity) end algebraic valuations (reference assignments) in Frege's thinking which he rejects (Suszko 1977, p. 378).

    From the point of view of the history of logic it is of interest to know something about the reasons why Frege used this amalgamation of two kinds of valuations. The main theses of this talk are the following

(1) The amalgamation is based on epistemological. assumptions.

(2) Analysing semantical aspects of his general scientific problem of the foundation of mathematics Frege treated a similar subject as the two kinds of valuations, distinguishing referent (truth and falsity) and sense ("Gedanke") of sentences.

(3) The difference between Frege's approach in solving his problem and other authors' approaches is based on different epistemologies.

(4) Distinguishing between the two kinds of valuation of sentences is of interest not only with respect to philosophical aspects of logic but also from the point of view of methodology." p. 167

"The distinction between the two different dimensions of valuation of sentences or logical formulae claimed by Suszko seems to me relevant especially from the point of view of methodology but also for the philosophical dispute over logic. For the second aspect the discussion of so called "paradoxes of material implication" provided an example.

I shall exemplify at this special case how the distinction of the two kinds of valuation can help us to come to a deeper understanding of logical expressions. From the philosophical point of view we can't discuss tautologies only as truth-value functions as they work in inferences, or with other words, we can't discuss them only with respect to inference relation. We have also to ask, which kind of reality will be represented by logical tautologies? What is the ontological aspect of logical tautologies? To find some understanding in this topic we will take attention to the so called paradoxes of material implication.

In so far as formulations like "from the False anything follows" or "the True follows from anything" are regarded only with respect to transformation of truth-values, they have the appearance of paradox. But if we assume that there are other reference assignments besides those of truth-values, then the two logical tautologies can stimulate us to seek them. Then we

can reflect that tautologies relate not only to inferences but also to conditions of being. With respect to such reference assignments the two tautologies above lose their paradoxical character. Their interpretation as theorems on being of truth says nothing more then "truth exists by itself" ("truth needs no assumptions") and "falsity is no basis of inference". A methodological value of the claimed distinction is given by a twofold sharpening of scientific research; controlling simultaneously methodical aspects of thinking and the association of content of thoughts. By this I mean: Suszko's criticism has it that logicians should think about the objects of scientific research the way other, practically minded scientists do in their research, because scientists in individual or teamwork control their procedures with concern both for the content of their ideas and the logical validity of their inferences. When we focus logical analysis of scientific labour more strongly on the unity and distinction of the two dimensions of valuation, I think we shall obtain new information for the automation of scientific work, and promote the development of applied logic. Comparing the intention behind, and the results of Frege's distinction between sense and referent may, on the one hand, help to describe scientific work; and, on the other hand, Suszko's distinction between the two kinds of valuation may give new insight in modelling scientific research-processes and help us to increase the efficiency of scientific labour."

    "Professor Roman Suszko introduced a broad class of languages into the literature of logic. In honour of Wittgenstein Suszko named these languages W-languages. Syntax, semantics and

consequence operations in these languages are based on the famous ontological principle: whatever exists is either a situation, or an object, or a function. The distinguishing property of W-languages is that they contain sentential and nominal variables, identity connectives and identity predicates. The intended interpretation of W-languages is such that sentential variables range over the universum of situations, nominal variables range over the universum of objects. All other symbols in these languages except sentential and nominal variables are interpreted as symbols of some functions both defined over the universum of situations and the universum of objects. Identity connectives correspond to identity relations between situations, and identity predicates correspond to identity relations between objects. It is obvious that the ordinary predicate calculus with identity is a part W-language excluding sentential variables, but the most often used sentential languages are the part of W-languages without nominal variables and identity predicates. In this paper, I will discuss only W-languages containing sentential variables, connectives and possibly quantifiers binding sentential variables." p. 195

    "In this paper I intend to present the general and formal principles of non-Fregean semantics for sentences and to derive the simplest consequences of these principles. The semantic principles constitute foundation of non-Fregean sentential calculus and its formal semantics and the philosophical interpretations of it. Non-Fregean sentential calculus is the basic part of non-Fregean logic. Non-Fregean logic is a generalization of classical logic. It was conceived by Roman Suszko under the influence of Wittgensteinian's *Tractatus Logico-Philosophicus*. The term "non-Fregean" indicates that the set of semantic correlate of sentences need not contain of just two elements, as it assumed by Frege in *Über Sinn und Bedeuting* (1892). Frege accepted the following semantic principle:

    (A.F.) all true sentences have the same common referent, and similarly all false sentences also have the one common referent.

    J. Łukasiewicz interpreted the common referent of true sentences as "Being" and analogically the common referent of all false sentences as "Unbeing". Suszko called the principle (A.F) the "semantical version of the Frege an axiom".

    In *Abolition of the Fregean Axiom* (1975) Suszko wrote: "If one accepts the Fregean Axiom then one is compelled to be an absolute monist in the sense that there exists only one and necessary fact".

    According to Suszko (A. F.) has a counterpart in the language of classical logic which is a formula asserting that the universe of sentential variables is a two-element set. This formula is not expressed that fact in the language of non-Fregean logic.

    In *SCI and modal systems* (1972) Suszko presents the properties of his logic as follows: "... non-Fregean logic is the

realization of the Fregean program in pure logic, logically bivalent and extensional with two modifications: (1) keep formulas (sentences) and terms (names) as disjoint syntactic categories, having sense and denotations,as well, and (2) drop the desperate assumption that all true or false sentences have the same denotation (not sense that is proposition)"." pp. 153-154.

25. ———. 1996. "A Formal Ontology of Situations." In *Formal Ontology*, edited by Poli, Roberto and Simons, Peter M., 173-187. Dordrecht: Kluwer Academic Publishers.

    "The theoretical foundation for this paper is the system of a non-Fregean logic created by Roman Suszko under the influence of Wittgenstein's *Tractatus Logico-Philosophicus*. In fact, we use just a fragment of it called here a non-Fregean sentential logic.

    Our basic term is that of a 'situation'. We do not answer the question what situations are. We simply assume that sentences present situations, and we provide a criterion determining when two sentences of some fixed language present the same situation.

    The lay-out of this paper is the following. First we set out certain philosophical consequences of the assumption adopted in classical logic that the only connectives of the language in question are the truth-functional ones. Then we sketch out briefly the axiomatics of non-Fregean sentential logic, and of a formal semantics of the algebraic type for it.

    Next, for an arbitrary model for a non-Fregean sentential logic, we pick out from the formulae true in that model a theory to be called the 'ontology of situations determined by the model in question' - in contradistinction to all sentences holding contingently in that model, i.e. not determined by its algebra. In the ontology of situations determined by a model we point out those propositions which pertain to possible worlds." p. 173

    3. Philosophical Interpretations of non-Fregean Sentential Logic

According to the principles of non-Fregean semantics as presented in Omyla 1975, all sentences of an interpreted language have their references. However, not in every such language are we in a position to put forward universal and existential theorems with regard to the structure of the universe of those references. To be in such position the language in question must contain as its sublanguage the language of non-Fregean sentential logic, or at least a significant part of it. As we are not interested here in the universe of any particular language, but only in that of a quite arbitrary one, let us consider now some philosophical aspects of arbitrary models of that kind. Let M = (U, F) be such a model. The elements of the universe of U do not generally answer to the intuitions we have about the reference of sentences, and about situations in particular. However, the algebraic structure imposed on U by the theory TR(M) is the same as that of a possible universe of situations, with regard to the operations corresponding to logical constants. Moreover, the set F has the formal properties of a possible (or 'admissible') set of situations obtaining in that universe. This is so because sentential variables are at the same time sentential formulae, and because the logical constants get in the model M their intended interpretation. Thus for any model M = (U, F) its algebra U is a formal representation of some universe of situations, and the set F is a formal representation of some admissible set of facts obtaining in some universe of situations. Not all the generalized SCI-algebras represent some algebra of situations; for not all of them contain a set F representing the facts, i.e. such that the couple (U, F) is a model. This depends on how the operations in the algebra U are defined. For the sake of simplicity the algebra of any model M = (U, F) for the language of a non-Fregean sentential logic will be called the *algebra of situations* occurring in the model M, and the designated set F will be called the set of *facts* obtaining in M. Such a terminology is appropriate here for we are interested only in the formal properties of those universe of situations which in view of our semantic principles find expression in the logical syntax of the language in question, and in consequence operation holding in it. By the completeness theorem for non-Fregean logic it

follows that for any consistent theory T in L there is a model M such that T e TR(M). Hence any theory in the language of non-Fregean sentential logic will be called a *theory of situations*.

The term 'ontology of situations' we take over from the title of Wolniewicz 1985 [*Ontologia sytuacji: Ontology of situations* in Polish], but we understand it a bit differently. By an *ontology of situations* we mean a theory describing the necessary facts of universe of situations fixed beforehand. I.e. an ontology of situations is a set of formulae holding in some fixed universe of situations, independently of which situations there are facts. To be more accurate, by an ontology of situations we mean a set of formulae with the following three properties:

(1) An ontology of situations is a theory having in its vocabulary just one kind of variable - e. the sentential one. Under the intended interpretation they range over a universe of situations. (Like in modem set theory there are variables of just one kind, i.e. those ranging over sets.)

(2) An ontology of situations is formulated in a language containing logical symbols only, i. e. logical constants and variables. To justify that postulate let us note that such a basic theory should not presuppose any other terminology except the logical one. At most it might adopt some specific ontological terms as primitive, characterizing them axiomatically. However, we shall deal here only with such ontologies of situations which are expressed exclusively in logical terms." pp. 180-181.

27. ———. 2003. "Possible Worlds in the Language of Non-Fregean Logic." *Studies in Logic, Grammar and Rhetoric* no. 6:7-15.

    "The term "possible world" is used usually in the metalanguage of modal logic, and it is applied to the interpretation of modal

connectives. Surprisingly, as it has been shown in Suszko *Ontology in the Tractatus L. Wittgenstein* (1968) certain versions of that notion can be defined in the language of non-Fregean logic exclusively, by means of sentential variables and logical constants. This is so, because some of the non-Fregean theories contain theories of modality, as shown in Suszko *Identity Connective and Modality* (1971).

Intuitively, possible worlds are maximal (with respect to an order of situations) and consistent situations, while the real world may be understand as a situation, which is a possible world and the fact.

Non-Fregean theories are theories based on the non-Fregean logic. Non-Fregean logic is the logical calculus created by Polish logician Roman Suszko in the sixties. The idea of that calculus was conceived under the influence of Wittgenstein's Tractatus. According to Wittgenstein, declarative sentences of any language describe situations."

32. Tsuji, Marcelo, and Lippel, David. 1998. "Many-Valued Logics and Suszko's Thesis Revisited." *Studia Logica* no. 60:299-309.

    "Suszko's thesis maintains that many-valued logics do not exist at all. In order to support it, R. Suszko offered a method for providing any "structural" abstract logic with a complete set of bivaluations. G. Malinowski challenged Suszko's thesis by constructing a new class of logics (called "q"-logics by him) for which Suszko's method fails. He argued that the key for logical two-valuedness was the "bivalent" partition of the Lindenbaum bundle associated with all structural abstract logics, while his "q"-logics were generated by "trivalent" matrices. This paper will show that contrary to these intuitions, logical two-valuedness has more to do with the geometrical properties of the deduction relation of a logical structure than with the algebraic properties embedded on it."

Selected Bibliography on the Scientific Philosophy of Mario Bunge

Introduction

"The Treatise encompasses what the author takes to be the nucleus of contemporary philosophy, namely semantics (theories of meaning and truth), epistemology (theories of knowledge), metaphysics (general theories of the world), and ethics (theories of value and of right action).

Social philosophy, political philosophy, legal philosophy, the philosophy of education, aesthetics, the philosophy of religion and other branches of philosophy have been excluded from the above quadrivium either because they have been absorbed by the sciences of man or because they may be regarded as applications of both fundamental philosophy and logic. Nor has logic been included in the Treatise although it is as much a part of philosophy as it is of mathematics. The reason for this exclusion is that logic has become a subject so technical that only mathematicians can hope to make original contributions to it. We have just borrowed whatever logic we use.

The philosophy expounded in the Treatise is systematic and, to some extent, also exact and scientific. That is, the philosophical theories formulated in these volumes are (a) formulated in certain exact (mathematical) languages and (b) hoped to be consistent with contemporary science.

Now a word of apology for attempting to build a system of basic philosophy. As we are supposed to live in the age of analysis, it may well be wondered whether there is any room left, except in the cemeteries of ideas, for philosophical syntheses. The author's opinion is that analysis, though necessary, is insufficient - except of course for destruction. The ultimate goal of theoretical research, be it in philosophy, science, or mathematics, is the construction of systems, i.e. theories. Moreover these theories should be articulated into systems rather than being disjoint, let alone mutually at odds.

Once we have got a system we may proceed to taking it apart. First the tree, then the sawdust. And having attained the sawdust stage we should move on to the next, namely the building of further systems. And this for three reasons : because the world itself is systemic, because no idea can become fully clear unless it is embedded in some system or other, and because sawdust philosophy is rather boring." (vol. I pp. V-VI)

Main publications

1. Bunge, Mario. 1959. *Causality. The Place of the Causal Principle in Modern Science*. Cambridge: Harvard University Press.

   Third revised edition in 1979 with the title: *Causality and modern science* - New York, Dover Publications.

   From the preface to the first edition:

   "This is an essay on determinism, with special emphasis on causal determinism -- or causality, for short. To some, causation and determination -- and consequently causalism and determinism -- are synonymous. But to most people, determinism is a special, extreme form of causality -- and even a particularly displeasing one, for it is wrongly supposed to deny man the possibility of changing the course of events. I take sides with the minority that regards causal determinism as a special form of determinism, namely, that kind of theory that holds the unrestricted validity of the causal principle to the

exclusion of every other principle of determination. The rational ground for regarding causality as a form of determinism, and not conversely, is that modern science employs many noncausal categories of determination or lawful production, such as statistical, structural, and dialectical, though they are often couched in causal language.

In this book, the causal principle is neither entirely accepted nor altogether rejected. My aim has been to analyze the meaning of the law of causation, and to make a critical examination of the extreme claims that it applies without restriction (causalism), and that it is an outmoded fetish (acausalism). I have tried to do this by studying how the causal principle actually works in various departments of modern science. However, I hope I have succeeded in avoiding technicalities -- save in a few isolable passages. The book is, in fact, addressed to the general scientific and philosophic reader.

The chief result of the above-mentioned examination is that the causal principle is neither a panacea nor a superstition, that the law of causation is a philosophical hypothesis employed in science and enjoying an approximate validity in certain fields, where it applies in competition with other principles of determination. a by-product of this analysis is a fresh examination of various topics in metascience, ranging from the status of mathematical objects to the nature and function of scientific law, explanation and prediction." (pp. V-VI).

    From the Preface:

    "The aims of this book are two. First, to contribute to the elucidation of some key concepts of both philosophy and science, such as those of conceptual analysis, analyticity, truth, law, level, and simplicity. Second, to show the complexity, i.e., the richness, of those very concepts, thereby exploding the myth that simplicity is always either a fact or a desideratum of research. To the extent to which the book succeeds in attaining

both goals it should discourage the concoction of naive, oversimplified pictures of knowledge.

The method employed is a kind of philosophic procedure that may be called metascientific elucidation. This kind of clarification may be analytic or synthetic: it may consist either in the analysis or reduction of conceptual entities (concepts, propositions, theories), or in the construction of such entities. In either case, whether in the phase of analysis or in the phase of synthesis, I call this work metascientific if the objects of elucidation are relevant to science and if the task is performed in a way congenial to science and with the help of some of the tools of contemporary scientific philosophy, such as formal logic, semantics, and theory formalization.

To the extent to which the ideas dealt with in this book are relevant to science and therefore of interest to both scientists and philosophers of science, and to the extent to which the analyses and syntheses proposed do take advantage of the tools of scientific philosophy, this is a work on metascientific elucidation." (p. V).

43. ———. 1974. *Treatise on Basic Philosophy. I: Sense and Reference*. Dordrecht: Reidel.

    "This is a study of the concepts of reference, representation, sense, truth, and their kin. These semantic concepts are prominent in the following sample statements: 'The field tensor refers to the field', 'A field theory represents the field it refers to', 'The sense of the field tensor is sketched by the field equations', and 'Experiment indicates that the field theory is approximately true'. Ours is, then, a work in philosophical semantics and moreover one centered on the semantics of factual (natural or social) science rather than on the semantics of either pure mathematics or of the natural languages. The semantics of science is, in a nutshell, the study of the symbol-construct-fact triangle whenever the construct of interest belongs to science. Thus conceived our discipline is closer to epistemology than to mathematics, linguistics, or the philosophy of language. The central aim of this work is to constitute a semantics of science -- not any theory but one capable of bringing some clarity to certain burning issues in contemporary science, that can be settled neither by computation nor by measurement. To illustrate: What are the genuine referents of quantum mechanics or of the theory of evolution?, and Which is the best way to endow a mathematical

formalism with a precise factual sense and a definite factual reference -- quite apart from questions of truth? A consequence of the restriction of our field of inquiry is that entire topics, such as the theory of quotation marks, the semantics of proper names, the paradoxes of self-reference, the norms of linguistic felicity, and even modal logic have been discarded as irrelevant to our concern. Likewise most model theoretic concepts, notably those of satisfaction, formal truth, and consequence, have been treated cursorily for not being directly relevant to factual science and for being in good hands anyway. We have focused our attention upon the semantic notions that are usually neglected or ill treated, mainly those of factual meaning and factual truth, and have tried to keep close to live science. The treatment of the various subjects is systematic or nearly so: every basic concept has been the object of a theory, and the various theories have been articulated into a single framework." pp. XI-XII.

44. ———. 1974. *Treatise on Basic Philosophy. Ii: Interpretation and Truth*. Dordrecht: Reidel.

"The present volume start with the problem of interpretation. Interpretation is construed as the assignment of constructs (e.g. predicates) to symbols. It can be purely mathematical, as when the dummy *x* is interpreted as an arbitrary natural number, or also factual, as when such a number is interpreted as the population of a town. Now, as we saw a while ago, predicated and propositions have both a sense and a reference -- and nothing else as far as meaning is concerned. These, then, are taken to be the meaning components. That is, the meaning of a construct is defined as the ordered couple constituted by its sense and its reference class. Once the meaning of a proposition has been established we can proceed to finding out its truth value -- provided it has one. If the proposition happens to be factual, i.e. to have factual referents, then it may be only

partially true -- if true at all. Hence we must clarify the concept of partial truth of fact. This we do by building a theory that combines features of both the correspondence and the coherence theories of truth. The remaining semantical notions, notably those of extension, vagueness, and definite description, are made to depend on the concepts of meaning and truth and are therefore treated towards the end of this work. The last chapter explores the relations between philosophical semantics and other branches of scholarship, in particular logic and metaphysics.

This volume, like its predecessor, has been conceived with a definite goal, namely that of producing a system of philosophical semantics capable of shedding some light on our knowledge of fact, whether ordinary or scientific. We leave the semantics of natural languages to linguists, psycholinguists and sociolinguists, and the semantics of logic and mathematics (i.e. model theory) to logicians and mathematicians. Our central concern has been, in other words, to clarify and systematize the notions of meaning and truth as they occur in relation to factual knowledge. For this reason our semantics borders on our epistemology." pp. Xi-XII.

45. ———. 1974. "The Relations of Logic and Semantics to Ontology." *Journal of Philosophical Logic* no. 3:195-219.

"Philosophers have argued untiringly, over many centuries, about the ties of logic with ontology. While some have followed Parmenides in identifying the two, others - particularly since Abelard - have asserted the ontological neutrality of logic and, finally, a third party has oscillated between those two extremes.

Unfortunately it has seldom been clear exactly what is meant by the `ontological commitment' of logic: mere reference to extralogical objects, the presupposition of definite ontological theses, or the ontological interpretation of logical formulas? Nor has an adequate tool for investigating this problem -

namely a full-fledged semantical theory - been available. (Recall that the only existing semantical theory proper, i.e. model theory, is not competent to handle this problem because it is solely concerned with the relations between an abstract theory and its models, as well as with the relations among the latter.) Much the same holds for semantics, though with a remarkable difference. If semantics presupposes logic, and the latter is ontologically committed, so must be semantics. But of course semantics could be tied to ontology even if logic were ontologically neutral. Therefore we need an independent investigation of the ontological commitment, if any, of semantics.

The purpose of this paper is to investigate the relations of logic and mathematics to ontology and to do it with the help of a theory of meaning. This theory has been sketched elsewhere (Bunge 1972, 1973) and will be fully expanded in a forthcoming book. We assign meanings to constructs, in particular predicates and propositions, and distinguish two meaning components : sense and reference. The sense of a construct *p* in a context **C** is the totality of logical relatives of *p* in **C**. If *p* belongs to a theoretical context then the sense of *p* is the collection of statements within the theory that either entail *p* or are entailed by *p*. And the reference class of a construct *p* is the totality of individuals "mentioned" (truthfully or not) by *p*. Finally the meaning of *p* is the ordered pair constituted by the sense of *p* and the reference of *p*. We shall apply these ideas to find out the meaning of the typical constructs of logic and semantics. But before doing so we must formulate those ideas somewhat more carefully. An before we tackle this task we must explain what we mean by a predicate and by a context."

"This book and its companion, namely Volume 4 of our *Treatise,* concern the basic traits and patterns of the real world. Their joint title could well be *The Structure of Reality*. They constitute then a work in ontology, metaphysics, philosophical cosmology, or general theory of systems. Our work is in line with an old and noble if maligned tradition: that of the pre-Socratic philosophers, Aristotle, Thomas Aquinas, Descartes, Spinoza, Leibniz, Hobbes, Helvetius, d'Holbach, Lotze, Engels, Peirce, Russell, and Whitehead. But at the same time it departs from tradition in the matter of method. In fact our aim is to take the rich legacy of ontological problems and hints bequeathed us by traditional metaphysics, add to it the ontological presuppositions of contemporary scientific research, top it with new hypotheses compatible with the science of the day, and elaborate the whole with the help of some mathematical tools.

The end result of our research is, like that of many a metaphysical venture in the past, a conceptual system. It is hoped that this system will not be ridiculously at variance with reason and experience. It is intended moreover to be both exact and scientific: exact in the sense that the theories composing it have a definite mathematical structure, and scientific in that these theories be consistent with and moreover rather close to science - or rather the bulk of science. Furthermore, to the extent that we succeed in our attempt, science and ontology will emerge not as disjoint but as overlapping. The sciences are regional ontologies and ontology is general science. After all, every substantive scientific problem is a subproblem of the problem of ontology, to wit, *What is the world like?*

After a long period underground, talk about metaphysics has again become respectable. However, we shall not be talking at length about ontology except in the Introduction. We shall instead do ontology. In the process we shall attempt to exhibit the mathematical structure of our concepts and we shall make the most of science. Being systematic our ontology may disappoint the historian. Being largely mathematical in form it will be pushed aside by the lover of grand verbal (but sometimes deep and fascinating) systems - not to speak of the lover of petty verbal matters. And being science-oriented it will fail to appeal to the friend of the esoteric. Indeed we shall be concerned with concrete objects such as atoms, fields, organisms, and societies. We shall abstain from talking about items that are neither concrete things nor properties, states or changes thereof. Any fictions entering our system will be devices useful in accounting for the structure of reality. (Constructs were dealt with in Volumes 1 and 2 of this work.)" pp. XIII-XIV.

    "This volume continues and concludes the task begun in Part 1, titled *The Furniture of the World* - namely the building of an exact and systematic ontology consistent with contemporary science. However, it can be read independently by anyone willing to take for granted the basic notions analyzed and systematized in the companion volume, namely those of substance, property, thing, possibility, change, space, and time.

    The three main themes of this book are wholeness (or systemicity), variety, and change. These three notions are analyzed and systematized, and they occur in some of the main assumptions of our ontology. One of these hypotheses is that the universe is not a heap of things but a thing composed of interconnected things - i.e. a system. This supersystem is composed of subsystems of various kinds: physical, biological, social, etc. Only physical systems may be composed of things that are not themselves systems, such as elementary particles and field quanta. However, even nonsystems are components of some system or other, and every system but the universe is a subsystem of some system: there are no strays. Ours is, in sum, a world of interconnected systems. Moreover it is the only one.

Another postulate of this system of ontology is that concrete systems are not all alike except insofar as they are systems and therefore tractable with the help of a unifying systems-theoretic framework. There are different kinds of system and each is characterized by its own peculiar properties and laws. Surely we sometimes succeed in accounting for the emergence and the history of a system in terms of its composition, environment, and structure. Nevertheless, explaining need not be explaining away: explained systems are not heaps, explained emergence is no mere resultant, and explained novelty is not old. Systemicity, emergence, and qualitative novelty and variety are as genuine as they are capable of being explained. Far from being incompatible with reason, wholeness and emergence can be understood.

A third major thesis of this work is that no system, except for the world as a whole, lasts forever. Systems get assembled, change, and break down. If natural, systems emerge as a result of self-assembly processes - often from debris of former systems. Even modest accretion processes can ensue in systems possessing emergent properties. Order can thus emerge from randomness, systems from physical precursors, living systems from nonliving ones, and so on. (Entropy need not increase in open systems.)

All three theses are by now common knowledge or nearly so. Now they - jointly with many others - have become part and parcel of a science oriented ontological system couched in a fairly exact language. Thus the novelty of this system resides sometimes in its components, and at other times in their organization." pp. XIII-XIV

Hebb; Glossary of technical terms; Bibliography; index of names; Index of subjects.

    From the Introduction: "This book deals with one of the oldest, most intriguing, and most difficult of all the problems belonging in the intersection of science and philosophy, namely the so-called *mind-body problem*. This is the system of ancient questions about the nature of the mental and its relations to the bodily.

    Here are some of the problems belonging to the mind-body problem circle. Are mind and body two separate entities? If so, how are they held together in the living organism? How do they get in touch in the beginning, how do they fly asunder at the end, and what becomes of the mind after the breakdown of the body? How do the two entities manage to function synchronically: what does it mean to say that mental states have neural correlates? Do these entities interact, and if so how? And which if any has the upper hand?

    If, on the other hand, mind and body are not different entities, is the mind corporeal? Or is it the other way around, namely is the body a form of the mind? Or is each a manifestation of a single (neutral) underlying inaccessible substance? In either case: what is mind? A thing, a collection of states of a thing, a set of events in the thing-or nothing at all? And whatever it is, is it just physical or is it something more? And in the latter case -- i.e. if mind is emergent relative to the physical level can it be explained in a scientific manner or can it be described only in ordinary language?

The mind-body problem is notoriously a hard nut to crack -- surely even more so than the problem of matter -- so much so that some scientists and philosophers despair of it being soluble at all. We submit that the problem, though tough, is soluble, and shall outline a solution to it in this work. But before doing so we shall have to do some philosophical scouting and conceptual cleansing, because part of the problem is that it is usually formulated in inadequate terms -- namely in those of ordinary language. These are inadequate not only because ordinary language is imprecise and poor but also because the European languages are loaded with a preconceived solution to the problem, namely psychophysical dualism, or the doctrine that mind and body are separate entities." (pp. XIII-XIV).

65. ———. 1983. *Treatise on Basic Philosophy. V: Epistemology and Methodology I: Exploring the World*. Dordrecht: Reidel.

    "This volume is devoted to general epistemology and methodology; the next, to some epistemological and methodological problems arising in contemporary science and technology. Epistemology, or the theory of knowledge (French

gnoséologie, German *Erkenntnistheorie),* is the field of research concerned with human knowledge in general-ordinary and scientific, intuitive and formal, pure and action-oriented. And methodology -- not to be mistaken for methodics, or a set of methods or techniques - -is the discipline that studies the principles of successful inquiry, whether in ordinary life, science, technology, or the humanities.

In this work epistemology is conceived as a merger of philosophy, psychology, and sociology: it describes and analyzes the various facets of human cognitive processes, whether successful or not, and whether or not they bear on everyday matters. Methodology too is descriptive and analytical, but in addition it is prescriptive or normative: it attempts to find out not only how people actually get to know but also how they ought to proceed in order to attain their cognitive goals. Thus both the epistemologist and the methodologist are supposed to describe and analyze experiment, but the methodologist is primarily interested in well designed experiment. In short, whereas epistemology is concerned with inquiry in general, the task of methodology is to find or perfect optimal inquiry strategies. (...)

This book continues an old tradition or, rather, a whole fan of traditions started in ancient Greece and India. But at the same time this work departs from tradition with regard to method. It is hoped that our inquiry into inquiry will be closer to the cognitive sciences and, in general, closer to contemporary research, than to obsolete dogma. More particularly, we shall proceed as follows. We shall pick up the rich legacy of epistemological problems and hints (often optimistically called `theories') bequeathed to us by the epistemological tradition. We shall enrich it with some of the problems and findings of contemporary scientific, technological and humanistic research, topping it with new hypotheses compatible with the science of the day-in particular neuroscience, psychology, and social science. And we shall elaborate and systematize the whole with the help of a few modest tools such as the concepts of set and function. However, in contradistinction with the former volumes in this *Treatise,* here we shall adopt a far more

modest level of formalization. The result is a greater intelligibility-and length. (The formalizations have been put in parentheses and in the Appendices.)"

Communication 97; Part II. Perceiving and thinking 127; 4. Perceiving 129; 5. Conceiving 159; 6. Inferring 199; Part III. Exploring and theorizing 231; 7. Exploring 233; 8. Conjecturing 286; 9. Systematizing 323; Appendices 377; 1. The power of mathematics in theory construction: a simple model of evolution 377; 2. The prose identifying the variables 380; Bibliography 383; Index of names 396; Index of subjects 401-403.

66. ———. 1983. *Treatise on Basic Philosophy. Vi: Epistemology and Methodology Ii: Understanding the World*. Dordrecht: Reidel.

"This is the sequel to *Epistemology I: Exploring the World*. In that work we studied cognition as a brain process, and communication as a social transaction. In particular, we studied perception and conception, the formation of propositions and proposals, exploration and systematization, discovery and invention. We regarded knowledge as an outcome of processes occurring in animals that learn by themselves and from one another. We took concepts and propositions, problems and proposals, to be equivalence classes of brain processes rather than ideal objects detached from brains and from society. However, we also stressed the need for studying such abstractions as well as the corresponding real processes.

In other words, we admitted that cognition ought to be studied both concretely (as a biopsychosocial process) and abstractly (with disregard for personal and social idiosyncrasies). We hoped in this way to favor the merger of the various hitherto separate approaches to the study of knowledge and knowledge-directed action: the neurophysiological and the psychological, the sociological and the historical, the epistemological and the

methodological ones. After all, these various approaches have a single aim, namely to improve our understanding of the ways we get to know reality, and the ways knowledge can be utilized to alter reality.

In this volume we will study the ways theories and proposals (e.g. technological designs) are put to the test and used to understand or alter reality. We will stress the difference between belief and inquiry. We will study the kinds of knowledge and the ways human knowledge grows, declines, or alters course. We will distinguish basic science from applied science, and both from technology and ideology, and we will seek to demarcate genuine knowledge from bogus. We will analyze the two mechanisms for enhancing the cross-fertilization and the unity of the various branches of knowledge: reduction and integration. We will stipulate the conceptual and empirical conditions a proposition has to fulfill in order to be valued as (sufficiently) true, and a proposal to be regarded as (suitably) efficient. (We shall do so in the light of real cases drawn from contemporary research rather than in obedience to a priori philosophical principles.) We will analyze a number of important yet vague notions, such as those of truth and efficiency, background and framework, paradigm and revolution. And we will explore the possible limits to our exploration of the world, as well as the limitations of the classical philosophies of knowledge.

The upshot of our study is a descriptive and normative epistemology that cannot be compressed into a couple of slogans, although it combines some features of rationalism with others of empiricism. This synthesis may be called *scientific realism* because the criterion for adopting or rejecting any given thesis is its compatibility or incompatibility with the practice of research in contemporary science (basic or applied), technology, or the humanities. We find no use for a theory of knowledge, however exact or ingenious it may be, that is divorced from knowledge." pp. XI-XII

    "This is a systematic study in the philosophy of science and technology, or PS & T for short. It struggles with some of the so-called Big Questions in and about contemporary S & T, i.e. questions supposed to be general, deep, hard, and still *sub judice*. Here is a random sample of such problematics. Is verbal psychotherapy scientific? Is political economy ideologically neutral? Are computers creative? What is the ontological status of machines? Is engineering just an application of basic science? What is language? Are there laws of history? Which are the driving forces of history? Which is the most fruitful approach to the study of mind? Are genes omnipotent? Are species collections or concrete systems? Do the earth sciences have laws of their own? Is chemistry nothing but a chapter of physics? Does contemporary cosmology confirm theology? Has the quantum theory refuted scientific realism? Is there a viable philosophy of mathematics? How are we to choose among alternative logics? What is the ontological status of concepts?

    These and other questions of interest to philosophy, as well as to science or technology, are tackled in this book from a viewpoint that is somewhat different from the dominant PS & T. An instant history of our discipline should help place our viewpoint. Modem PS & T began together with modern science and it was cultivated by scientists and philosophers until it

became professionalized in the 1920s. At this time it took *a logical* turn: it was equated with the logical analysis and orderly reconstruction of scientific theories. Experimental and field work were deemed to be ancillary to theorizing, and technology was praised or deprecated, but hardly analyzed. Later on PS & T took *a linguistic* turn: only the languages of S & T seemed to matter. Facts, problems, theories, experiments, methods, designs and plans were overlooked. More recently, PS & T took *a historical* turn: everything was seen from a historical viewpoint. The logic, semantics, epistemology, ontology and ethics of S & T were declared subservient to its history or even irrelevant. Even more recently there have been attempts to force PS & T to take *a sociological* turn. Facts are said to be the creation of researchers, who would act only in response to social stimuli or inhibitors; there would be neither norms nor objective truth.

I believe the time has come for PS & T to take, or rather retake, a *philosophical* turn: to investigate the logical and semantical, epistemological and ontological, axiological and ethical problems raised by contemporary S & T, leaving the sociological and historical studies to social scientists. The time has also come to approach the problematics of PS & T in *a scientific* fashion, by paying close attention to current developments in S & T and checking philosophical hypotheses against the findings of S & T. At least this is the approach adopted in the present volume.

Although this book is part of an eight-volume treatise, it is self-contained: it can be read independently of the others. Moreover, each chapter can be read independently of the others. The book is addressed to philosophers, scientists, technologists, and culture watchers. It may be used as a textbook in a one year advanced course in PS & T. Each chapter may also be used in a course in the corresponding branch of PS & T.

To facilitate its use as a textbook, the present volume has been divided into two parts. Part I is devoted to the philosophy of the formal and physical sciences, whereas Part II covers the

philosophy of the biological and social sciences as well as of the technologies." p. IX-X.

78. ———. 1989. *Treatise on Basic Philosophy. Viii: Ethics: The Good and the Right*. Dordrecht: Reidel.

    "This book is about values, morals, and human actions. It is also about axiology (the study of value systems), ethics (the study of moral codes), and action theory. It is concerned with both private and public values, morals, and actions. In particular, it seeks to uncover the roots and functions (biological and social) of valuation and morality. As well, it attempts to sketch a value system, a moral code and a general plan of action that may help us tackle the dreadful problems of our time.

    (...)

    The revival of value theory and ethics can be attested to by anyone who bothers to peruse the philosophical journals published in the course of the latest few years. This revival is particularly welcome at a time when philosophy as a whole is at a low ebb - so much so that some philosophers have proclaimed its death while others have taken leave of reason. But the current flourishing of ethics may be an indicator of the general crisis of modern civilization, for people do not usually reflect on problems about values and morals until they face them, and nowadays most of us face them daily by the dozen.

    This is the last volume of my *Treatise on Basic Philosophy,* on which I started to work two decades ago. It is consistent with the previous volumes, in particular with the naturalistic, dynamicist, emergentist and systemist ontology, as well as with the realistic and ratioempiricist semantics and epistemology formulated therein. However, the present book may be read independently of its companions." p. XIV-XV.

82. ———. 1996. *Finding Philosophy in Social Science*. New Haven: Yale University Press.

    From the preface: "This book has been written for social scientists curious about philosophy, as well as for philosophers interested in social studies. As suggested by its title, it focuses on the philosophy involved in social studies -- albeit, usually in a tacit manner. I will argue that all social studies,

    whether scientific or literary, are crammed with philosophical concepts, such as those of fact, system, process, theory, test, and truth. They also contain or presuppose some philosophical assumptions, such as that societies are (or are not) mere aggregates of individuals, that people can (or cannot) choose and act rationally, and that social facts can (or cannot) be studied scientifically.

    Regrettably, most students of society rarely pause to examine the philosophical ideas they adopt. When they do, they often fall under the influence of philosophies that do not match the practice of contemporary social science research. Most of the philosophers who have paid attention to the philosophy in or about social science have held some or all of the following three theses: that there is a clear divide between the social and the natural sciences, there being no mixed or socio-natural sciences; that science and philosophy are mutually disjoint, so

cannot learn from one another; that the philosophy of social science is the same as that of the natural sciences -- or else that the two are utterly disjoint. I will argue that all three, and many more received opinions, are false. I will examine some of the key philosophical ideas inherent in the social (and socio-natural) sciences, as well as some of the topical philosophical problems raised by them. Thus I will elucidate the ontological notions of event and causation, the semantic concepts of meaning and truth, the epistemological ideas of hypothesis and indicator, the axiological notions of value and utility, and the ethical concepts of right and duty, I will also wrestle with such classical controversies as individualism versus holism, rationalism versus empiricism, explanation versus understanding, and nomothetic versus idiographic science."

From the Introduction: "The *ontology* of social science examines the nature of society, the kinds of social process, the difference between law and rule, the roles of causation and chance, and the nature of planning. Hence it is concerned with questions such as: Are there social systems, or only aggregates of individuals? Are cultures systems of values and norms, or concrete social systems? What is a micro-macro link? What are the engines of history: the environment, biological factors, the economy, politics, culture, or all of these? Are there occasionally leaps in social evolution, or was Marshall right in inscribing the maxim *Natura non facit saltum* on the title page of his classic *Principles of Economics*? Is society a text to be deciphered by hermeneutics or semiotics? Is human history analogous to biological evolution?" (p. 7).

Theory and History of Ontology

Raul Corazzon || e-mail: rc@ontology

Fred Sommers on the Logic of Natural Language

Introduction

"The essay before you is the fruit of some fifteen years of investigation into the logical syntax of natural language. In the summer of 1965 I read a paper to the Congress on Logic and Scientific Method at Bedford College, London, that presented an algorithm for the algebraic treatment of syllogistic arguments in which categorical propositions were transcribed as fractions and reciprocals.(1) I spent the next two years looking for a more general algorithm with greater expressive power, one that could transcribe relational, multi-general propositions as well as simple categoricals. (...)The first article on the more general calculus was published in Mind, January 1970, as The Calculus of Terms. Unfortunately its message had little effect although I followed it by a series of articles that exploited the new notation and exposed some important consequences for the philosophy of language. It became clear that the current Fregean logic had fully replaced the more traditional logic of terms and that articles could not do justice to the neo-classical alternative that I was advocating.

I had for some years been planning to write a book on the logic of categories but the lack of response to my more recent interests, the logic of terms and its relation to natural syntax, strongly suggested that I must first do book-length justice to these latter topics. I began writing this essay in 1975 and, after several long interruptions and two revisions, completed it in the summer of 1980. I still hope to write the book on category theory. In the present work chapter 13) I do little more than indicate how traditional logic's way with

contrariety leads to the conception of categories that is at the basis of Ryle's seminal work in the forties and my own more formal treatment of categories in the early sixties. Indeed it was my recognition of the need for a notion of contrariety that would allow for saying, for example, that Saturday is neither fed nor unfed (which renders both 'Saturday is fed' and 'Saturday is unfed' 'category mistakes') that prompted me to re-examine traditional Aristotelian logic with its characteristic distinction between contrary terms or predicates and contradictory propositions. This distinction is absent in modern logic which uses the forms 'Px' and '-Px' to represent contrary predicates thereby conflating the two oppositions of contrariety and contradiction so fundamental to the classical term-theoretic standpoint. (2) The current use of propositional negation as the sole form of opposition 'precludes the kind of internal term and predicate structure that makes it possible to treat negation as a means of changing around concepts inside the meanings of terms and predicates'. The quoted words are Jerrold Katz's but they are typical of the sort of reaction one gets from linguists who find the restricted grammar of 'standard' logical languages to be at odds with their intuitions into the logical grammar of empirical languages.

More generally the theory of logical form that has its source in the formation rules for standard languages poses severe problems for the linguist. The older subject-predicate logic with its classical binary noun-phrase verb-phrase analysis of sentences has been discredited and while some linguists appear prepared to abandon the classical analysis in favour of analyses that conform more closely to the syntax of modern predicate logic others may welcome a rehabilitated classical logic of 'categorical' sentences that leaves the fundamental binary structure in place." (pp. VII-VIII)

Notes

(1) 'On a Fregean Dogma'. Apparently I was not alone in representing categorical propositions as fractions. Charles Merchant, a mathematician at the University of Arizona, subsequently wrote me of his independent work on this algorithm.

(2) Early treatments of the distinction between negating a sentence and denying predicate may be found in my 'Predicability' (1963) and 'Truth Functional counterfactuals' (1964).

From: Fred Sommers, *The Logic of Natural Language*, Oxford: Clarendon Press 1982.

"Today's orthodox logic came into existence about a hundred years ago when it replaced the traditional syllogistic logic, which itself had been the orthodoxy for many centuries. The arguments for abandoning the old logic were not conclusive. Once entrenched, the new logic felt no need for supporting arguments. Today logic students are given at best some bad old arguments against the old logic, and then are simply presented with the new logic to be learned. No one asks 'Why?'. But Sommers has. He has challenged the deeply entrenched presumption that no syllogistic logic can measure up to the great power and beauty of the predicate calculus. What is more, not only has Sommers shown the emperor to have no clothes, he has produced a fine new suit. He has returned to the venerable but forgotten logic of Aristotle, Ockham, and Leibniz, and has shown that it does have hidden assets which make it more than adequate as an alternative to the orthodox system. So I think this rebellion is well worth joining. And, of course, there's that pleasure I referred to earlier. Sommers speaks of "the perverse pleasure of advocacy-in this day and age-of Aristotle over Frege."I have put this collection together for several reasons. As a supplement to Sommers' own work it illustrates the broad scope of Sommers' challenge to modern orthodox views about logic and language. Not all of those whose work is represented here fully endorse Sommers' programme. Some may explicitly reject parts of it. But all recognize its importance." (Preface by the Editor, pp. X-XI)

From: George Englebretsen (ed.), *The New Syllogistic*, New York: Peter Lang 1987.

"Frederic Sommers was born on 1 January 1923 in New York City. He was educated at Columbia University, where he received his BA and then his PhD in philosophy in 1955, writing a dissertation on "An Empiricist Ontology: A Study in the Metaphysics of Alfred North Whitehead." Sommers began his academic career at Columbia University, where he was assistant professor of philosophy from 1955 to 1963. He moved to Brandeis University in 1964 as associate professor of philosophy, was promoted to full professor in 1966, and

held the Harry Austryn Wolfson Chair of Philosophy from 1965 until his retirement in 1993.

Sommers was a staunch proponent of a traditionalist view of logic, albeit in a "modern" guise. He has consistently expressed the view that progress in logic should have stopped, if not with Leibniz, than at least before Frege, devising a variant of syllogistic very close to that undertaken by Leibniz. His "Calculus of Terms" applies a system of pluses and minuses to the subjects and predicates of categorical syllogisms, to indicate inclusion and exclusion, the copula and the negation of the copula, as well as for affirmation and denial, with a universal statement having the form + (–...) or – (+...) for the subject term and a particular statement having the form + (+...) or – (–...) for the subject term. His system is essentially that of Leibniz's, with Leibniz's "=" and "±" replaced in Sommers's notation by "+" and "–" respectively. In *Logic of Natural Language* Sommers developed the system in more detail together with a consideration of its purported philosophical implications. He argued that his calculus of terms is significantly different from the predicate logic; but Gregory MCCulloch [1984] argued that there really is no such difference. Sommers claims that his calculus of terms is an elaboration of Leibniz's proposal.

Sommers argued that the subject–predicate semantic analysis of syllogistic propositions with the proper treatment, retains as much deductive power as Frege's calculus, and in a important sense is more expressively powerful than Frege's function-theoretic quantification theory, because it is closer to natural language while being able to handle polyadic relations.

In Sommers's calculus, relational terms are represented in the form '$R \pm A \pm B \pm \ldots \pm K$', where R is the relation and some/all A, some/all B, ..., some/all K are objects of R. Thus Sommers is able to analyze such propositions as "All censors withhold some books from minors" as "$W + B - M$."

Sommers's "Ordinary Language Tree" for mapping relations among Aristotelian categories was based upon his efforts to arithmeticize Aristotelian syllogistic as a calculus of terms. In Sommers's tree, genera and species give way to subjects and predicates, treated as classes. His book *The Logic of Natural Language* (1982) provides a

detailed, systematic and unified elaboration of the Ordinary Language Tree and the Calculus of Terms and explores the philosophical import of this logical system. His *Invitation to Formal Reasoning: The Logic of Terms* (2000) provides a textbook elaboration of the logic of terms."

From: Irving H. Anellis, "SOMMERS, Frederic Tamler", in: John R. Shook (ed.), *The Dictionary of Modern American Philosophers*, Bristol: Thoemmes 2005.

Excerpts from his publications (in progress)

"The thesis I will be arguing for belongs to the premodern -- which is to say, pre-Fregean-tradition of logical theory whose major figures from Aristotle to Leibniz never doubted that the sentences of a natural language like Greek or English that entered into deductive reasoning could, for logical purposes, be parsed in ways familiar to the grammarian. Implicit in the program of traditional formal logic is the idea of a logical syntax of natural language in which the grammarians' nounphrase/verb-phrase analysis is the fundamental pattern. (...)The idea of a logical syntax of natural language stands opposed to what the Fregean believes about logical form. Frege himself held that an adequate account of inferences expressed in natural language requires translation into a new idiom, the idiom of a language expressly constructed for use by logicians.

This new logical language is no mere convenience: Frege believed that the syntax of natural language was logically useless, misleading, and incoherent. Being convinced of this, Frege did not criticize the grammarian for misconstruing natural language. On the contrary, from Frege's standpoint the grammarian could well be right in his description of the syntax of natural language. If so the inadequacy is not in the grammarian but in his subject-matter. Michael Dummett aptly sums up Frege's reaction to the phenomenon that the natural languages lack a perspicuous logical grammar with the words 'so much the worse for natural language'." (pp. 1-2)

From: Fred Sommers, *The Logic of Natural Language*, Oxford: Clarendon Press 1982.

Extensions of Sommers' Term Logic

"Conclusion.

NTL [*Numerical Term Logic*] works within the assumption that all logical statements are affirmations as to the quantity of members of a set (or subset). Sommers' logical system and Modem Predicate Logic, although opposed in many ways, have at least one thing in common: they may each formulate statements that affirm only either that a set is empty, or that it is not. In Sommers' system's primary scheme, whether a subset is non-empty is indicated by the copulation of two terms (with a primary "+"), each of which represents one of the intersecting sets; and whether a set is empty is indicated by the denial of such a copulation (with a primary "- "). Despite its quantificational difficulties, Sommers' system is remarkably expressive, deductively powerful, theoretically well founded (as well as relatively faithful to the structure of natural language); indeed, it surpasses MPL [*Modern Predicate Logic*] in each of these respects. In building upon the notational foundation of Sommers' system, NTL not only retains these important advantages, but, in fact, amplifies them enormously. In NTL, variable numerical quantity is incorporated as a formal element of logical copulation; thus, in an NTL primary scheme analogous to Sommers', to what degree a subset is non-empty would be indicated by the copulation of two terms (with a binary "+x"), each of which represents one of the intersecting sets; and to what degree a subset is empty would be indicated by the denial of a copulation of this kind. NTL therefore becomes infinitely more expressive than Sommers' system-not merely in the fact that it may formulate statements with quantities of infinite magnitude, but also in the fact that it accounts for various types of quantification (fractional, subjective natural language quantification, etc.); it also becomes far more powerful than Sommers' system in its deductive scope (for it handles inferences involving different kinds of numerically quantified statements uniformly), is theoretically stronger (for example, in its accounts of "wild quantity", vacuosity, and subalternation), and is more loyal than Sommers' system to the structure of natural language (for it requires no contortionism in its expression)."    "An important part of any investigation into the meaning of an expression E consists of finding what may be called its sense location. This is done by noting which expressions may be conjoined with E and which may not. "E is that expression which goes well with A, C, or G in a sentence but E fails to make sense when used with B, D, F or H, etc." When the mutual sense relations of A, B, C, D, E, F, G . . . are known, then we have a map in which each expression has a sense location with respect to the other expressions under consideration. The question we shall consider is whether the natural language provides any rules for the construction of such a map, whether there is, as it were, an invariant structure to "linguistic

cartography" in terms of which it would be possible to give the sense location of any of the expressions in the language. To this question we shall eventually offer an affirmative answer.

The theory of meaning adopted here is a current one. It is the theory of meaning-in-use. Employing a convenient distinction of Ryle's between two kinds of knowing, we may say that a knowledge of meaning is a "knowing how" rather than a "knowing that": to know the meaning of an expression is to know how to use it. Such knowledge includes an ability to formulate a piece of non-absurd discourse containing the expression. Thus to know the meaning of a word is to know how to formulate some sentences containing the word, to know the meaning of a sentence is to know how to formulate some coherent discourse containing the sentence. It is almost true to say that the meaning is this use, i.e. the meaning of E (if "E" is a word or phrase) is the set of sentences containing E and that my knowledge of the meaning of E grows (though not in direct proportion) with my ability to formulate more and more sentences in which E has a proper use. A complete knowledge of E would then be represented by the set of all such sentences. The trouble with this view is that even such a set would not specify uniquely the meaning of any one expression since the set would also specify the meaning of all those expressions which have the same use-at this level of use. For example, the word " short " might be specified by the sentences in which it has a non-absurd occurrence from a purely semantic point of view, but those sentences may also specify the word "tall". We must therefore keep in mind that a map of sense relations giving the locations of a group of expressions does not tell the whole story of "their use in the language", i.e., their meanings. Nevertheless, we shall see that such a map removes ambiguity, ensuring univocity for the expressions located on it. For this reason we shall identify the sense of an expression with its location on a map. This entails a distinction between sense and meaning, a distinction which we shall enforce rather than justify. The sense of an expression will be its location with respect to other expressions, its semantic range. It is what it "makes sense" with as contrasted with what it fails to make

sense with. Its meaning is governed only in part by sense rules. " Tall " and " short " may have the same " sense " ; it is because of other rules governing their use that they diverge in meaning. Thus, giving the sense of an expression is not yet the same as giving its meaning. One who wishes to know more about the meaning of a given located expression will enquire at that address." pp. 160-161.

5. ———. 1963. "Types and Ontology." *Philosophical Review* no. 72:327-363.

   Reprinted, with minor corrections, in: Peter Frederick Strawson (ed.) - *Philosophical logic* - Oxford, Oxford University Press, 1967 pp. 138-169 and in Dale Jacquette (ed.) - Philosophy of logic. An anthology - Oxford, Basil Blackwell 2002 pp. 103-119.

   "In this paper (*) I shall be examining several notions of types which have important application in natural languages. I shall show that one of Russell's definitions of a type can be combined with one of Ryle's to give us two other and more powerful type conceptions which are free of the criticisms advanced against each of the former. The results cast considerable light on the relation of `a language' to the sorts of things one can use the language to make statements about; for example, it becomes clear that the number of `sorts of things' discriminated by any natural language is always finite. But far more important, the new type concepts enable us to exhibit formally the type structure of any natural language. It is this structure which determines the way the language discriminates different sorts of things. Since the question of ontology is `What sorts of things are there?' the results may be construed as a formal ontology. The old Russell programme for an ontology which is defined by a logically correct (or corrected) language is thereby reinstated, though in a revised form. That programme has foundered on the type problem for natural languages. Black, for example, has brought out grave difficulties in Russell's type theory as it applies to natural languages, and he used those difficulties to promote scepticism about the Russell programme. But if I am right, a simple and adequate theory of

types governs natural language and dictates its ontological commitments to different sorts of things."

(*) There are four sections to the paper. Section I isolates the problem of types for natural language and develops four type concepts appropriate to it. Section II reformulates these concepts syntactically and reconsiders Black's general criticism of a formal theory of types for natural language. In Section III the relation of types to ambiguity, and a problem raised by Black, is examined in detail. Section IV is constructive; the type-structural principle is stated and proved. The ontological meaning of the principle is discussed and the principle is illustratively applied.

6. ———. 1963. "Meaning Relations and the Analytic." *Journal of Philosophy* no. 60:524-534.

   "In his critique of the analytic-synthetic distinction Quine distinguishes two classes of analytic statements: (a1) those that are logically true and (a2) those that lean on extralogical meaning relations. In this paper the same critique that Quine applies against a2 statements is used against a1 statements. By showing that both suffer the same fate at Quine's hands, it is shown that Quine's vital contrast is not a contrast at all and that his criticism goes further than he wants it to go. The paper concludes that the "flight from intension" can become a flight away from the grounds presupposed for any application of logical and linguistic rules."

7. ———. 1964. "A Program for Coherence." *Philosophical Review* no. 73:522-527.

   "The following are some points made in reply to criticism of the author's *Types and ontology*: (1) if p is a property, define the category of p (cp) as the set of individuals that can "significantly" be said to have p. (2) if any "individual" belongs both to cp and cq, then either cp includes cq or cq includes cp or cp=cq. (3) an ontology is coherent only if it satisfies (2) for all individuals.

   Suppose that spirits cannot be characterized as colored or colorless, i.e., they are not in c-colored. Assume also that chairs

are not in c-sad. Then neither category includes the other. yet persons are in both. To avoid incoherence we must deny that persons are individuals.

Coherent alternatives to Cartesianism put chairs in c-sad (panpsychism) or spirits in c-colored. The thesis supports Russell's general idea than any coherent ontology is formally isomorphic to linguistic type structure."

11. ———. 1966. "Why Is There Something and Not Nothing?" *Analysis* no. 26:177-181.

    "The question is not why it is possible there is something but (granting that something is possible) *why is* there something? Why not nothing?

    This can be answered by way of an ontological proof. For this purpose we define a neglected but important kind of possibility which we call categorial. We say for example that things older than the square root of 2 are not possible things or that unfed theorems are 'categorially' impossible. A thing older than the square root of 2 is not a possible thing because while there is nothing that is older than the square root of 2, neither is there anything that fails to be. Again the statement `some theorems are fed' is a category mistake. There is nothing that is an unfed theorem and nothing that fails to be one since what failed to be one would be a fed theorem or an unfed non-theorem, or a fed non-theorem and there are no such things. So understood, categorial impossibility is existentially definable. More generally, if D is a monadic descriptive term and D is its logical contrary (2) (applicable to all those D-less things that are 'privative' to the state of being D) then D-things are categorially impossible, if and only if there is nothing that is D and nothing that is -D.

By this definition things that are red and blue (all over)-though presumably impossible in some other way-are categorially possible since any table is either red (failing to be blue) or blue (failing to be red) or it fails to be red and also fails to be blue. The logical contrary of the term `red and blue' is truly affirmable of all material objects of whatever colour and also of those that are colourless.

Without having defined possibility in any general way, we are accepting as a premiss of our argument that something is possible. We assume further that whatever is not a categorially possible thing is not a possible thing.

Now suppose there were nothing. It is then true for every predicate term P, that nothing is P. It is also true that there is nothing that fails to be P so that P-things are categorially impossible. If P-things are categorially impossible, they are not possible things. Since this holds for every P, nothing at all is possible. But we have assumed that something is possible and this is incompatible with the nihilist hypothesis. We see then that if something is possible, something is actual.

The same argument can be viewed another way. If something is possible it is categorially possible. For something to be possible there must be some terms predicable of some things. But if there were nothing at all, all terms would be like 'older than the square root of 2'. That some terms are predicable can be argued from the fact that-as matters actually stand-there are many things and many terms truly applicable to those things. But if there were nothing at all, not only would terms like `old' not be truly applicable, they would be altogether impredicable. Nothing would then be possible. But we recall that our question was not `why is anything even possible?' And we see again that if anything is possible, something is actual." pp. 177-178.

(1) Heidegger considers this the crucial question for the philosophy of existence. What is given here is the traditional or "essentialist" reply.

(2) The relation of contrariety holding between a pair of terms (or attributes) does not force us to consider either one of the

pair to be negative. Just as being D is a privation of D, so (equally) is being D (or -D) a privation of D. Coloured objects, for instance, fail to be colourless.

12. ———. 1966. "On a Fregean Dogma." In *Problems in the Philosophy of Mathematics*, edited by Lakatos, Imre, 47-62. Amsterdam: North-Holland.

    Proceedings of the International Colloquium in the Philosophy of Science (Bedford College, 1965).

    Discussion: L. Kalmár: *Not Fregean and not a Dogma* 63; M. Dummett: *A Comment on 'On a Fregean Dogma'* 63; C. Lejewski: *The Logical Form of Singular and General Statements* 68; W. V. Quine: *Three Remarks* 70; F. Sommers: *Reply* 71-81.

    "In the following passage Russell states an accepted and familiar thesis :

    The first serious advance in real logic since the time of the Greeks was made independently by Peano and Frege -- both mathematicians. Traditional logic regarded the two propositions 'Socrates is mortal' and 'All men are mortal' as being of the same form; Peano and Frege showed that they are utterly different in form. The philosophical importance of logic may be illustrated by the fact that this confusion - which is still committed by most writers -- obscured not only the whole study of the forms of judgment and inference, but also the relation of things to their qualities, of concrete existence to abstract concepts, and to the world of Platonic ideas . Peano and Frege, who pointed out the error did so for technical reasons ... but the philosophical importance of the advance which they made is impossible to exaggerate.(*)

    In what follows I wish to be understood as criticising the quantificational "translation" of general categoricals like 'All men are mortal' only insofar as this is represented as exhibiting such statements to have a different logical form from singular predications. I am not criticising quantification theory as an indispensable logical tool, especially for inference involving statements of more than one variable. The standard general

categoricals however are not of this type ; it is for example well-known that quantification is not needed for syllogistic inference. What is not known is that we can treat the categoricals as simple subject-predicate statements on an exact par with singular predications. There is therefore no good logical reason for saying that general and singular statements must differ in logical form.

The doctrine that (1) 'Socrates is mortal' and (2) 'Men are mortal' differ in logical form assumes that the following is the corect account of what these statements say: (a) Both say that 'is mortal' is true of some, thing or things; the first says it is true of Socrates; the second that it is true of whatever 'is a man' is true. It follows (b) that the logical form of the second statement differs from that of the first. For while the first is a simple predication, the second is a "quantified" statement." pp. 48-48.

"Remarking on alternatives to his conception of truth Tarski rejects a formulation associated with correspondence theories:

If we should decide to extend the popular usage of the term "designate" by applying it not only to names, but also to sentences, and if we agreed to speak of the designata of sentences as "slates of affairs" we could possibly use for the same purpose the following phrase:

(C) A sentence is true if it designates an existing state of affairs. However [this] formulation can lead to various misunderstandings for [it is not] sufficiently precise and clear . . . . It is up to us to look for a more precise expression of our intuitions. (1)

The purpose Tarski speaks of is "to do justice to our intuitions which adhere to the classical Aristotelian conception of truth."

Tarski takes this to be some form of correspondence theory. He has earlier considered and rejected an even less satisfactory formula of this sort: 'a sentence is true if it corresponds to reality'. His own semantic conception of truth is meant to be a more precise variant doing justice to the correspondence standpoint. In this spirit I shall presently suggest a revised version of (C).

15. ———. 1969. "Do We Need Identity?" *Journal of Philosophy* no. 66:499-504.

    "Identity is shown to be definable within traditional syllogistic logic. the idea is to treat singular terms as general terms syntactically. this means we allow singular terms in predicate positions and also allow them to be prefixed by 'every', 'some' and 'no' when in subject position.

    However universal and particular singular statements are logically equivalent: if K is a singular term then K is p every K is p some K is p. This equivalence is called the law of wild quantity.

    Identity is defined thus: J is identical with K df. some J is K. This definition together with the law of wild quantities gives all the formal properties of the identity relation."

18. ———. 1971. "Structural Ontology." *Philosophia.Philosophical quarterly of Israel* no. 1:21-42.

    "Whether a certain sort of things exists is commonly disputed in philosophy. I argue that in some important classical

instances the dispute is grounded in another more fundamental one: whether certain entities are individuals or composite. Disputes over individuality or compositeness are generated when certain accepted conditions for individuality seem not to be satisfied. In the last part of the paper I examine the formal condition for non-compositeness (it is not yet a criterion for individuality) tracing it to its logical source. The condition is shown to provide the structural constraints for coherent ontologies."

19. ———. 1973. "Existence and Predication." In *Logic and Ontology*, edited by Munitz, Milton K., 159-174. New York: New York University Press.

    "To contemporary philosophers the question whether 'exists' is a predicate is a syntactical question. Using an older terminology, it is the question whether 'exists' is an autocategorematic or a syncategorematic expression. In more recent parlance it is the question whether 'exists' belongs among the formative-logical signs or among the descriptive-extralogical signs of a logically adequate language.

    Those who give canonical status to the idioms of quantification theory have a ready answer to this question. In the syntax of modern logic 'exists' is a syncategorematic expression. In canonical translations 'exists' is never a predicate. To accept this popular view is to assume that the formative expressions enumerated in the formation rules for predicate logic constitute a definitive list. But this overlooks the fact that the line distinguishing certain signs as formative, logical, or syncategorematic from other signs that are descriptive, extralogical, or autocategorematic has been arbitrarily drawn. How, indeed, do we decide whether a sign is syncategorematic or autocategorematic?

    There is, of course, the indirect appeal to the power of a logic with this or that list of formatives. For example, if identity is added to the list of logical signs of the lower functional calculus, there is a significant increase in inference power. This, however, is an argument for adding identity to a system whose logical syntax has already been determined by an arbitrarily

enumerated list of formatives. It can, for example, be shown that identity is not needed in a logical language whose syntax differs radically from that of the standard first-order functional calculus.(1) The point is that the question whether a certain sign is formative or descriptive cannot be fruitfully answered by considering how an already-constituted logical language will fare with this sign or without it. This retail approach begs the more fundamental question raised by the distinction between logical and extra-logical signs: What principle governs the distinction; what distinguishes the logical signs from the extralogical signs?

The problem in this general form has been raised by Tarski and since discussed by many other writers, most notably by Pap, Popper and Quine. However, the state of the problem has not been significantly advanced beyond the conclusion tentatively offered by Tarski:

Perhaps it will be possible to find important objective arguments which enable us to justify the traditional boundary between logical and extralogical expressions. But I also consider it quite possible that investigation will bring no positive results in this direction so that we shall be compelled to regard such concepts as `logical consequence', 'analytic statement' and 'tautology' as relative concepts which must, on each occasion be related to a definite, although in greater or less degree, arbitrary division of terms into logical and extra-logical.(2)

In this larger perspective the syntactic status of existence can only be determined within some general theory of logical syntax that "justifies" and sharpens the boundary between logical and extralogical signs. As Tarski noted, such a theory will have important bearing on such fundamental notions of logical theory as tautology and validity. But it should also, and, as it were, incidentally, answer our own question, namely, whether 'exists' is a syncategorematic or autocategorematic expression." (pp. 159-160).

    "Modern thinkers regard logic as a purely formal discipline like number theory, and not to be confused with any empirical discipline such as cognitive psychology, which may seek to characterize how people actually reason. Opposed to this is the traditional view that even a formal logic can be cognitively veridical -- descriptive of procedures people actually follow in arriving at their deductive judgments (logic as Laws of Thought). In a cognitively veridical logic, any formal proof that a deductive judgment, intuitively arrived at, is valid should ideally conform to the method the reasoning subject has used to arrive at that judgment. More specifically, it should reveal the actual reckoning process that the reasoning subject more or less consciously carries out when they make a deductive inference. That the common logical words used in everyday reasoning -- words such as 'and', 'if,''some', 'is''not,' and 'all -'- have fixed positive and negative charges has escaped the notice of modern logic. The present paper shows how, by unconsciously recognizing 'not' and 'all' as 'minus-words', while recognizing 'and', 'some', and 'is' as 'plus words', a child can intuitively reckon, for example, 'not (-) all (-) dogs are (+) friendly' as equivalent to 'some (+) dogs aren't (-) friendly': -(-D+F) = +D-F."

52. ———. 2013. *The Mondial and the Ontological.*

    Forthcoming.

    "In 2006 I began working on a book that was to consist of two parts: (1) an account of the tree theory, including a historical background and an appraisal of reactions to the theory, and (2) a summary of Sommers' newer ideas regarding metaphysical issues, with an attempt to integrate the older and newer ideas. By 2009 I had nearly completed part (1), but then, as so often happens with the best laid plans, things changed. Assuming, no

doubt based on my sketchy account of what I was up to, that my new book would be primarily about the tree theory, Sommers wrote to me that he was hard at work on a new book of his own, a book in which he was laying out, once and for all, in detail his new metaphysical theory ("mondialism").

Needless to say, that theory and its relation to the tree theory was to be the subject of my part (2). He asked me to help him with his book and I was both eager and happy to do so. Anything I had to say could wait - not so for Sommers (then well into his ninth decade). Sommers' book, *The Mondial and the Ontological* is forthcoming. As it turned out, much of the work of tying together the tree theory, the term logic, the truth theory and mondialism still needs to be done. So I returned once again to that task."

53. Sommers, Fred, and Englebretsen, George. 2000. *An Invitation to Formal Reasoning. The Logic of Terms*. Aldershot: Ashgate.

Co-author: George Englebretsen.

The book "introduces the discipline of formal logic by means of a powerful new system formulated by Fred Sommers.

This system, term logic, is different in a number of ways from the standard system employed in modern logic; most striking is, its greater simplicity and naturalness. Based on a radically different theory of logical syntax than the one Frege used when initiating modern mathematical logic in the 19th Century, term logic borrows insights from Aristotle's syllogistic, Scholastic logicians, Leibniz, and the 19th century British algebraists.

Term logic takes its syntax directly from natural language, construing statements as combinations of pairs of terms, where complex terms are taken to have the same syntax as statements. Whereas standard logic requires extensive 'translation' from natural language to symbolic language, term logic requires only 'transcription' into the symbolic language. Its naturalness is the result of its ability to stay close to the forms of sentences usually found in every day discourse. Written by the founders

of the term logic approach, An Invitation to Formal Reasoning is a unique introduction and exploration of this new system, offering numerous exercises and examples throughout the text. Summarising the standard system of mathematical logic to set term logic in context, and showing how the two systems compare, this book presents an alternative approach to standard modern logic for those studying formal logic, philosophy of language or computer theory."

Studies about his work

For the bibliography of George Englebretsen see the page about him.

1. Altham, J.E.J. 1971. "Ambiguity and Predication." *Mind* no. 80:253-257.

   "Recommends abandoning Sommers' rule about ambiguity, in his *Predictability*. The rule enforces many implausible judgments. Three arguments for it are defective. One involves confusions over negation of a universal conditional, one rests on a seemingly arbitrary definition, the third rests on an unrealistic assumption about universes of discourse."

2. Brody, B.A. 1972. "Sommers on Predicability." *Philosophical Studies* no. 23:138-140.

   "Sommers has proposed a principle as to when cross-categorial predication is univocal. In this note, I offer some counterexamples, both to his principle and to the premises from which he derives it."

3. Cogan, Robert. 1976. "A Criticism of Sommers' Language Tree." *Notre Dame Journal of Formal Logic* no. 17:308-310.

   "In *The Ordinary Language Tree* and three later papers, Fred Sommers has made a number of valuable contributions to formal type theory. Anyone familiar with this work of Sommers understands why it is philosophically attractive: the logical ingenuity shown by Sommers is admirable. However, presuming such familiarity I shall argue that Sommers' restriction to ordinary language is a necessary yet counterformal way of securing mapping applicability for his work, and that it obscures a major obstacle to such application: the fact that genuine doubt about sense-value is systematic in a way rendering it unresolvable by his formal methods. I shall first distinguish between "doubt" in the ordinary sense, and genuine doubt. Next I will show that Sommers' examples of sense arguments are not ones in which genuine doubt is resolved and then define the sense in which genuine doubt is systematic, using his own symbolism. Fourth, I will explain how his restriction to ordinary language tends to obscure this fact, and fifth, in what way the restriction is both necessary and counter-formal."

4. De Sousa, Ronald Bon. 1966. "The Tree of English Bears Bitter Fruit." *The Journal of Philosophy* no. 63:37-46.

   6. "A discussion of Fred Sommers' proposal for a new "test of coherence" for ontologies based on a revised theory of types. The theory leads to intolerably counterintuitive proliferations of senses of terms in natural languages. Its "proof" is shown to rest on the very propositions which the theory is supposed to establish. It presupposes the existence of a well defined set of grammatical but absurd sentence types. This assumption takes two forms. on the first interpretation, it prohibits an individual from turning up in two different categories; on the second interpretation, it amounts to the principle of transitivity of predication. But the first is supposed to be a "consequence" of the theory, ruling out Strawsonian persons; and the second turns up as a "theorem"."

5. Elgood, A.G. 1970. "Sommers's Rules of Sense." *Philosophical Quarterly* no. 20:166-169.

   "There has recently been some discussion on Sommers's rules of sense. Dan Passel (1969) has drawn attention to the incompleteness of one of these rules (R (U)) but is prepared to accept it as " correct ", meaning "that no mistakes about terms having a use with one another follow from its use". Mrs. Susan Haack (1967) has produced what she considers counter-examples to another rule, that for enforcing ambiguity, and R. Van Straaten has alleged that these examples are not well-formed and therefore are not counterexamples. He doubts "for strictly logical reasons" whether anyone *can* produce a counter-example. Since he does not give any such reasons, and since I find the foundations for Sommers's own derivations unsatisfactory, I offer apparent counter-examples of my own. One counter-example can be used to invalidate several of Sommers's important sense rules. This is so because they have a common logical structure. This logical structure I shall now display."

8. Greenberg, Robert S. 1972. "Individuals and the Theory of Predication." *The Journal of Philosophy* no. 69:435-448.

   "As is known, Fred Sommers has provided rules of sense (*) which can be used to determine: (a) whether certain terms can occur together in a significant subject-predicate sentence, (b) whether things covered by certain terms belong to the same type of thing, and (c) whether certain terms of a theory must be construed as being ambiguous, if the theory is to be coherent. Problems such as these fall within the area of philosophy sometimes called *theory of predication, type theory,* or, more generally, *ontology,* and hence the purpose of a large part of Sommers' program is to provide methods for distinguishing and placing in a coherent structure what are generally called categories."

   (*) "Predicability" (1965) and "Types and ontology" (1963).

9. Griffin, Nicholas. 1977. "Do We Need Predication?" *Dialogue.Canadian Philosophical Review* no. 16:653-663.

   "The paper is concerned with the standard distinction between the 'is' of identity and the 'is' of predication. It deals, in particular with attempts by Fred Sommers ("Journal of Philosophy", 1969) and Michael Lockwood ("Philosophical Review", 1975) to show that the distinction is ill-founded since identity statements are predications of singular terms. This proposal is criticized mainly on the grounds that the notion of a singular term depends upon identity and thus can't be used in a program to eliminate identity. An alternative means of removing the distinction between the 'is' of identity and the 'is' of predication, by eliminating predication in favour of relative identities using Geach's suggestion that "x" is "F" is equivalent to "x" is the same "F" as something, is briefly sketched."

12. Hacking, Ian. 2001. "Aristotelian Categories and Cognitive Domains." *Synthese* no. 126:473-515.

    "This paper puts together an ancient and a recent approach to classificatory language, thought, and ontology. It includes on the one hand an interpretation of Aristotle's ten categories,with remarks on his first category, called (or translated as) substance in the Categories or What a thing is in the Topics. On the other hand is the idea of domain-specific cognitive abilities urged in contemporary developmental psychology. Each family of ideas can be used to understand the other. Neither the metaphysical nor the psychological approach is intrinsically more fundamental; they complement each other. The paper incidentally clarifies distinct uses of the word "category" in different disciplines, and also attempts to make explicit several notions of "domain". It also examines Aristotle's most exotic and least discussed categories, being-in-a-position (e.g., sitting) and having-(on) (e.g., armour). Finally the paper suggests a tentative connection between Fred Sommers' theory of types and Aristotle's first category."

13. Kasher, Asa. 1972. "Sommers' Concept of Natural Syntax." *Philosophical Studies (Ireland)* no. 20:139-143.

    "It is shown that syntactic principles are not sufficient for the solution of semantic paradoxes. Light is shed on Sommers' conception of natural syntax in *On concepts of truth in natural languages* (1969), by showing that his solution is also semantic in nature."

16. Lockwood, Michael. 1975. "On Predicating Proper Names." *The Philosophical Review* no. 84:471-498.

    "Mill's account of proper names presupposes -- contrary to current logical theory -- that in an identity sentence such as 'Cicero is Tully', 'is' has the same meaning as in sentences which are unquestionably of the 'S is P' form. The purpose of this article is to defend Mill's assumption and explore its implications. It is argued that Mill is inconsistent in holding both that, in the above sentence, 'Tully' is a genuine predicate and that proper names lack connotation. This tension may be removed, however, if we allow that proper names do connote, but that what they connote is merely the having of a certain identity."

18. Martin, Robert L. 1969. "Sommers on Denial and Negation." *Noûs* no. 3:219-226.

    "Sommers' arguments in *Predicability* (1965) for a distinction between denial and negation (the former applying primarily to predicates, the latter to sentences) are criticized and found not to sustain the distinction. In response to his claim that the distinction permits a simple formal resolution of the predication paradoxes, I present a strengthened version of these paradoxes for which, apparently, the suggested resolution fails."

19. Massie, David. 1967. "Sommers' Tree Theory: A Reply to De Sousa." *The Journal of Philosophy* no. 64:185-193.

    "In a recent article in this Journal Ronald Bon de Sousa attempts to criticize Fred Sommers' category theory, the"tree" theory, as described in "Types and Ontology." Sommers' paper is an important and brilliant contribution to formal linguistic analysis, and deserves critical attention. De Sousa, however, seems to have failed to understand it, in general and in detail; thus his remarks, which tend to be abusive in tone, are unilluminating and largely irrelevant. Since de Sousa may give the impression of having been as careful as he ought to have

been, he can easily be misleading on some elementary but essential points in Sommers' theory, and for that reason his comments call for an answer."

20. McCulloch, Gregory. 1984. "Frege, Sommers, Singular Reference." In *Frege: Tradition and Influence*, edited by Crispin, Wright, 110-125. Oxford: Blackwell.

    "In his provocative recent book [*The logic of natural language*, 1982] Fred Sommers sets out to formulate a traditional term logic (hereafter TFL) that is a genuine and significant alternative to the Fregean type of logic (MPL) currently accepted as standard. (1) Broadly speaking, his procedure has two components. On the one hand, he tries to develop a logical syntax, based on the TFL model, that is roughly the equal of MPL in terms of expressive and inferential power. On the other, he engages in a sustained effort to show how such a logic would be free of certain logical and semantic commitments, allegedly typical of MPL, that are, according to Sommers, implausible or otherwise unsatisfactory.

    In the present paper I do not question the extent of Sommers's success in the first task; nor do I try directly to defend MPL against his strictures. My concern is with one fundamental difference between the two logical frameworks as Sommers sees them. This supposed difference concerns expressions like proper names that appear to make straightforward singular reference to particular objects. Sommers argues at length that many of the significant differences alleged to hold between the two logics can be traced to the way that they handle such expressions. This contention he links to his claim that whereas the basic propositions of MPL are singular, those of TFL are general; and this in turn he links to his view that the two logics are based upon significantly different accounts of the first-order generality expressed by words like 'all' and `some' (Sommers, Ch. 1-5, 11-12). I try to show that these claims are greatly exaggerated.

    Even if one grants that Sommers succeeds in giving a novel, TFL-style account of first-order generality, it is a mistake to think, as Sommers does, that this novelty consists in an

interesting avoidance of commitment to the idea of singular reference. This is, furthermore, an entirely distinct issue from that of the semantic treatment of proper names. Sommers's claims gain a spurious' plausibility because of his failure to keep these distinct questions apart. And finally, anyway, we see that one's adoption of logical framework - TFL or MPL - does not materially affect one's options when dealing with proper names: both logics can accommodate any of the usual alternatives. If I am right in all this, the appearance of deep differences over singular reference just dissolves.

Sommers's book deserves careful and extended attention. Both in the effort to reinstate TFL as a worthwhile approach, and in the claim to have succeeded, Sommers finds himself in opposition to much received `Fregean' opinion in logic, semantics, and the philosophy of language. Illumination is to be had from a piecemeal treatment of the many issues raised here. This paper is just one restricted contribution to that enterprise."

(1) 'MPL' and `TFL' are Sommers's own abbreviations for 'Modern Predicate Logic' and `Traditional Formal Logic' respectively. He attempts no precise definition of what a logic must be like if it is to count as MPL-type, but seems to have in mind logics that employ quantifier/variable notations in a more or less orthodox manner. Similarly, his use of 'logic' is quite flexible, and is used to apply not merely to a given calculus but to this plus the concepts, notions, and presuppositions that a standard semantic interpretation would employ. I follow him in this, although certain dangers in this are highlighted in §§ II and III.

21. Mendelsohn, Richard L. 1987. "Frege Two Senses of 'Is'." *Notre Dame Journal of Formal Logic* no. 28:139-160.

24. "It is widely believed that there are two senses of 'is', the 'is' of identity and the 'is' of predication, and that this distinction was clearly drawn by Frege in On Concept and Object, although it was anticipated by others, perhaps, e.g., by Plato in the Sophist. As opposed to this received view, I will argue that Frege had not successfully distinguished two senses of 'is',

indeed that his argument leads to precisely the opposite conclusion; on the other hand, the distinction Plato had supposedly drawn in the Sophist, which seems to rest on a semantics Frege was explicitly rejecting, is, given that semantic framework, viable.

Frege had introduced this distinction in order to buttress his view that proper names could not serve as genuine predicates: a proper name occupying ostensible predicate position could not be functioning as a predicate because the 'is' in such a statement would have to be the 'is' of identity, not the 'is' of predication.

I will argue that Frege had been mistaken on this point as well. More generally, I will argue that Frege's theoretical analysis of language is not, as he had thought, incompatible with proper names being allowed to play a genuinely predicative role.

My remarks are prompted by Michael Lockwood's stimulating article, On Predicating Proper Names (1975), which contains an extensive and detailed criticism of Frege's position."

28. Passell, Dan. 1969. "On Sommers' Logic of Sense and Nonsense." *Mind*:132-133.

    "Sommers' rule, R(U), for testing sense arguments, taken as an assertion about what makes sense, fails to state a necessary condition of what makes sense. Counterexamples to that assertion occur with terms taken from the same node of his ordinary language tree. For one example, the color terms, alabaster, blue, cream, dun, which obviously do make sense

together, cannot be classified as making sense together by the rule. This is because the condition required by the rule for determining that two terms make sense cannot be met for terms at the same node."

29. Peterson, Philip L. 1995. "Contraries and the Cubes and Disks of Opposition." *Metaphilosophy* no. 26:107-137.

    "Prior, Sommers, and McIntosh hold that propositional contrariety is derivative, based on term contrariety. I argue that propositional contrariety is basic. In a proper Aristotelian square, one proposition is contrary to another if and only if the one properly entails the denial of the other.

    Term contrariness produces a "cube" of opposition. Contrariety can be further elaborated on "bare" cubes and disks. Geach's analyses involving multiple quantifiers give no support for term-contrariness-as-basic, and there is little hope for developing H. W. B. Joseph's vague idea about "furtherest apart" on a quantitative scale."

30. Purdy, William C. 1992. "On the Question: 'Do We Need Identity?'." *Notre Dame Journal of Formal Logic* no. 33:593-603.

    31. "This paper formalizes and extends Sommers' position on identity. This formalization is compared with MPL to define precisely the difference in expressive power. The formal language defined for this investigation is similar to the language of MPL (modern predicate logic). The similarity will not only facilitate comparison, but perhaps will also make this formal language more palatable to readers whose experience and/or predisposition favors MPL."

31. Reinhardt, L.R. 1965. "Dualism and Categories." *Proceedings of the Aristotelian Society* no. 66:71-92.

32. Richmond, Samuel A. 1971. "Sommers on Predicability." *The Journal of Philosophy* no. 68:138-142.

    "Sommers has introduced a rule for enforcing ambiguity which indicates the conditions under which a term cannot univocally bridge a type difference. I argue that the theory of predication

from which the rule follows is either false or ambiguous in one of its crucial concepts. Sommers suggests the theory of predication may better set the bounds of metaphysics than the theory of knowledge. But the theory of predication itself needs to be justified by showing its epistemic utilities."

33. ———. 1975. "A Possible Empirical Violation of Sommers' Rule for Enforcing Ambiguity." *Philosophical Studies* no. 28:363-366.

    "In an article entitled "Predicability," Fred Sommers has introduced a rule for enforcing ambiguity which indicates the logical conditions under which a predicate cannot univocally bridge a type difference. the rule places unacceptable a priori restrictions on future empirical discoveries.

    The plausibility of the rule can be explained by the fact that violation of it in constructing empirical universal generalizations results in dualism and detracts from the unity of science.

    Dualism exists when there are two sets of predicates such that members of each set enter into universally general statements only with members of the same set."

34. Routley, Richard. 1969. "Categories. Expressions or Things?" *Theoria* no. 35:215-238.

    "Rival views on the composition of categories hold that categories are categories of things, that they are categories of expressions, or that they are both simultaneously. In view of the significance paradoxes-analogues of the modal paradoxes - here introduced, all these positions must be rejected, and two different sorts of meaninglessness distinguished. This distinction leads to the formulation of two distinct category theories, one apparently concerned with things, the other with descriptions. A case is made out for inclusive categories and against exclusive categories. Systematic ambiguity is attacked and shown to be tantamount to exclusiveness of categories. To allow for inclusive categories the usual notion of 'in the same category as' must be abandoned and replaced by a relative notion, except for certain sorts of categories - minimal

categories. A definition of 'in the same category as' is proposed for minimal categories; and some aspects of Ryle's theory and Sommers's theory are examined in the light of these results."

35. Sayward, Charles. 1976. "A Defense of Sommers." *Philosophical Studies* no. 29:343-347.

    "Among the theses of Sommers' type theory are these: every individual belongs to some type; every category is a union of types. A recent criticism of Sommers is directed at these two theses. I argue that the criticism is mistaken."

36. ———. 1978. "Are There Infinitely Many Sorts of Things?" *Philosophia.Philosophical Quarterly of Israel* no. 8:17-30.

37. ———. 1981. "The Tree Theory and Isomorphism." *Analysis* no. 41:6-11.

    "A main thesis of Fred Sommers' type theory, is that an isomorphism exists between any natural language and the categories discriminated by that language. Here I give an explanation of what this claim comes to. And then I argue that, so understood, the claim is incompatible with Zermelo-Fraenkel set theory. Finally, I argue against trying to salvage the isomorphism thesis by appealing to some other set theory."

38. Sayward, Charles, and Voss, Stephen H. 1972. "Absurdity and Spanning." *Philosophia.Philosophical Quarterly of Israel* no. 2:227-238.

    "On the basis of observations J. J. C. Smart once made concerning the absurdity of sentences like 'the seat of the bed is hard', a plausible case can be made that there is little point to developing a theory of types, particularly one of the sort envisaged by Fred Sommers. The authors defend such theories against this objection by a partial elucidation of the distinctions between the concepts of spanning and predicability and between category mistakenness and absurdity in general. The argument suggests that further clarification of the concepts of spanning and category mistakenness should be sought in reflection upon the more familiar concepts of a sort of thing and a predicate category."

39. Shearson, W.A. 1977. "Speaking of Philosophy: A Reply to Paul Churchland." *Dialogue.Canadian Philosophical Review* no. 16:502-506.

"In his critique of George Englebretsen's *Speaking of persons* (1975), Paul Churchland has failed, on several accounts, to grasp the intent of Englebretsen's work. Most importantly, he has not seen that the main task there was to defend a particular theory of persons (videlicet attributism). Much of Churchland's confusion is shown to follow from his inability to connect Englebretsen's work with the logico-linguistic studies of F. Sommers on the one hand and the metaphysical studies of P. F. Strawson on the other."

40. Straaten, R.van. 1968. "Sommers' Rule and Equivocity." *Analysis* no. 29:58-61.

41. ———. 1971. "A Modification of Sommers' Rule." *Philosophical Studies* no. 22:16-20.

42. ———. 1971. "Sommers on Strawson's and Descartes' Ontology." *Mind* no. 80:148-149.

43. Suzman, Jonathan. 1972. "The Ordinary Language Lattice." *Mind* no. 81:434-436.

"F. Sommers ("Mind" 1959, "Philosophical Review" 1963) claims the predicates (monadic) of natural languages, if grouped by a relation u, or cosignificance, generate topological trees. if true, this would have wide philosophical significance; Sommers' ontology rests on this claim about trees. but it is false, in that the u-relation can be shown not to generate trees but lattices. if any natural languages do have the tree, rather than the lattice structure this would need empirical demonstration. this is proved with the help of two notions, that of the significance range of a term, and that of a constructible predicate true of all items in a terms significance range. it is also shown that u is in fact a vacuous tie, in that all terms are so related."

44. Swiggart, Peter. 1972. "The Limits of Statement Denial." *Mind* no. 81:437-442.

"This paper discusses Fred Sommers' distinction between statement negation and statement denial, as outlined in 'Predicability' and other papers. First I show that the formal nature of the distinction requires us to regard a given statement as having only a single denial. This point dissipates Sommers' proposed solution to the counterfactual problem, since that solution depends upon the existence of multiple denials of a given statement. Sommers' difficulty is traced to the assumption that an ordinary language sentence like 'S is unclean' can be recognized as a statement denial. But such recognition proves to be inherently ambiguous. Sommers' terminology can be an effective means of introducing the results of type analysis into standard logical notation, but strict and possibly intolerable limits must be placed upon its use in formulating basic type theory or as a help in solving traditional philosophical problems."

45. Szabolcsi, Lorne. 2008. *Numerical Term Logic*. Lewiston: Edwin Mellen Press.

    Edited by George Englebretsen.

    Contents: Preface by George Englebretsen I; Foreword by Fred Sommers V-XII; 1. Introduction 1; 2. Numerical Term Logic 11; 2.1 Logical Notation 11; 2.1.1. Rudiments of the Notational Extension 11; 2.1.2. Non-exceptive Occurrences of "At least" and "Fewer than" 16; 2.1.3. Exact Quantification 20;

    2.1.4. Comparatives 22; 2.1.5. Fractional Quantities 24; 2.1.6. Subjective Natural Language Quantifiers 26; 2.2. Inference in NTL 2; 2.2.1. Quantifier Transformation 32; 2.2.2. Guaranteed Reference 35: 2.2.3. Existential Implication 39; 2.2.4 Distribution 42; 2.2.5. Mediate Logical Inference: Quantifier Addition 44; 2.2.6. Algebraic Inference 57; 2.3. Further Developments in NTL 67; 2.3.1. The Plurivocality of "Some" 67; 2.3.2. "Only" 68; 2.3.3. "Most" vs. "The Majority" 70; 2.3.4. Wild Quantity 72; 2.3.5. Definite Descriptions 74; 2.3.6. Subalternation 76; 3. Other Systems of Intermediate Quantification 81; 3.1. Bruce Thompson 82; 3.2. Philip Peterson 92; 3.3. Wallace Murphree 99; 3.4. A Note on

Generalized Quantifiers 101; 4. Conclusion 103; 5. Notes 105; 6. Bibliography 115; 7. Index 117-119.

"The ability to reason with numerically quantified propositions is of practical as well as theoretical importance. Lorne's Szabolcsi's valuable unpublished writings should be studied and edited for publication. His pioneering contributions to numerical logic deserve to be recognized and well-known. I know of no better method than his for dealing with numerical arguments." (Fred Sommers, p. XII).

D. M. (David Malet) Armstrong's Moderate Realism

Bibliography

Books

1. Armstrong, David Malet. 1978. *Universals and Scientific Realism*. Cambridge: Cambridge.

   Volume One: Nominalism and Realism

   Contents: Acknowledgments VI; Index VII-XI; Introduction XIII-XV; Part One: Preliminaries; 1. Predicates 1; Part Two: Theories of Universals; 2. Predicate Nominalism 11; 3. Concept Nominalism 25; 4. Class Nominalism 28; 5. Resemblance Nominalism 44; 6. Arguments for realism 58; 7. Transcendent universals 64; 8. Properties and relations as particulars 77; Part Three: Particulars; 9. Are particulars reducible to universals? 89; 10. The Lockean account of particulars 102; Particulars and universals 108; 12. A world-hypothesis 126; The argument of volume II 133; Glossary of terms and principles formulated 136; Works cited 141; Index to volume I 145.

   Volume Two: A theory of Universals

   The argument of volume I 1; Part Four: Predicates and universals; 13. Relations between predicates and universals 7; 14. Rejection of disjunctive and negative universals 19; 15. Acceptance of conjunctive universals 30; 16. The identification of universals 43; 17. Different semantic correlations between predicates and universals 53; Part Five: Properties and relations; 18. Properties 61; 19. Relations 75; Part six: The

analysis of resemblance 95; 21. The resemblance of universals (I) 101; 22. The resemblance of universals (II): a new account 116; Part Seven: Higher-order universals; 23. Higher-order properties 133; 24. Higher-order relations 148; In conclusion 167; Glossary of terms and principles formulated 169; Works cited 177; Index to volume I and II 183.

"It is argued in this work, first, that there are universals, both monadic and polyadic, that is, properties and relations, which exist independently of the classifying mind. Realism is thus accepted, Nominalism rejected. Second, it is argued that no monadic universal is found except as a property of some particular, and no polyadic universal except as a relation holding between particulars. Transcendent or Platonic Realism is thus rejected. Third, it is argued that what universals there are is not to be determined simply by considering what predicates can be applied to particulars. Instead, it is the task of total science, conceived of as total enquiry, to determine what universals there are. The view defended is therefore a scientific Realism about universals. It might also be called a posteriori Realism. The working out of a scientific Realism about universals is intended to be the special contribution of these volumes.

Contemporary philosophy recognizes two main lines of argument for the existence of objective universals. The first is, or is a descendant of, Plato's One over Many argument. Its premiss is that many different particulars can all have what appears to be the same nature. In the terms used by C. S. Peirce, different tokens may all be of the same type. The conclusion of the argument is simply that in general this appearance cannot be explained away, but must be accepted. There is such a thing as identity of nature.

I take this argument to be sound. But the argument is sometimes presented as an argument from genera words. It is asked how a general term can be applied to an indefinite multiplicity of particulars. It is answered that these particulars must be identical in some respect. There are two disadvantages in presenting the argument in this linguistic fashion. First, it

obscures the fact that the same term may apply in virtue of different natures of the different particulars. As a result, where Realism is embraced, it is likely to be a priori rather than scientific Realism. Second, presenting the argument linguistically encourages confusion with an unsound argument to universals from meaning.

This second argument moves from the existence of meaningful general words to the existence of universals which are the meanings of those words. Universals are postulated as the second term of the meaning relation. The argument from ideal cases, such as Plato's perfect circle, is perhaps a special case of this semantic argument to universals.

I regard this second line of argument as completely unsound. Furthermore, I believe that the identification of universals with meanings (connotations, intensions), which this argument presupposes, has been a 'disaster for the theory of universals. A thoroughgoing separation of the theory of universals from the theory of the semantics of general terms is in fact required. Only if we first develop a satisfactory theory of universals can we expect to develop fruitfully the further topic of the semantics of general terms. Philosophers have all too often tried to proceed in the opposite way.

In this first volume, Nominalism and Realism, I criticize at length and reject various versions of Nominalism, together with Platonic Realism. I also examine and reject the view that properties and relations are as particular as the objects which have properties and relations. I conclude that we must admit objective universals which, however, cannot exist independently of particulars. I go on to examine the notion of a particular and reject the view that we can give an account of particulars as "bundles of universals". The conclusion drawn is that particularity and universality, irreducible to each other, are both involved in all existence. I end the first book by sketching a world-hypothesis which admits nothing but particulars having (universal) properties and relations.

The position reached at that point, though contested by many, is, at least in general outline, familiar enough. But in the second

volume a detailed attempt is made to work out a theory of universals which is based upon natural science. In making this attempt, I enter relatively unexplored territory. For with the exception of a suggestive paper by Hilary Putnam (1970a) contemporary philosophers, at least, have largely ignored the possibility of developing a theory of objective universals, where the particular universals admitted are determined cm the basis of scientific rather than semantic considerations. It might perhaps be argued that Plato in his later works, Aristotle and the Scholastic Realists were ahead of contemporary philosophy in this matter, although handicapped by the relative backwardness of the science and the scientific methodology of their day.

My contention is that, by accepting this a posteriori Realism, the theory of universals, arguably the central problem of ontology, can be placed on a securer and more intelligible foundation than anything previously available. In particular, such a doctrine makes possible the reconciliation of an empiricist epistemology, which I wish to retain, with ontological realism about universals.

Not all particulars are first-order particulars. Universals themselves fall under universals. That is to say, universals have certain properties and stand in certain relations to each other. In the final part of the second book an attempt is made to work out a theory of higher-order universals, but, again, one which is compatible with an empiricist epistemology. Of quite particular importance is the topic of relations between universals. For this topic may hold the key to an account of the nature of causation and of nomic necessity. By this means, it may prove possible to answer Hume without sacrificing Empiricism.

Finally, a word on the phrase "a posteriori Realism". The phrase may suggest that the theory advanced in this work is supported to be supported by a posteriori reasonings of the sort with which natural science has made us familiar. This is far from being the case. The reasoning will have the characteristically a priori flavour which philosophical reasonings, especially when they concern first philosophy, seem

inevitably, if distressingly, to have. What is maintained is the proposition that what universals there are is to be determined a posteriori. The status of this proposition is, however, a further question. It may have to be established, if it can be established, by a priori or relatively a priori reasoning." (Introduction to the First volume).

2. ———. 1989. *Universals. An Opinionated Introduction*. Boulder: Westview Press.

   Contents: Preface XI-XII; 1. The problem 1; 2. Primitive natural classes 21; 3. Resemblance nominalism 39; 4. Particulars as bundles of universals 59; 5. Universals as attributes 75; 6. Tropes 113; 7. Summing up 135; References 141; Index 145.

   "This book is intended to be intelligible to the advanced undergraduate student and should also be suitable for graduate seminars. However, I hope that it will also be of interest to professional philosophers, particularly those who are sympathetic to the project of an empirical metaphysics. Since the publication of my book *Universals and Scientific Realism* in 1978, although my views have remained the same in broad outline, I have become aware of various mistakes and omissions in what I said then. The present work, therefore, besides introducing the topic, tries to push the subject further ahead.

   I now think that a particular type of moderate Nominalism, moderate because it admits properties and relations, but a Nominalism because it takes the properties and relations to be particulars rather than universals, can be developed as an important and quite plausible rival to a moderate Realism about universals. In the earlier book I gave such a Nominalism only brief consideration. By contrast, in this work a battle between Nominalists and Realists over the status of properties and relations becomes one main theme.

   In general, I have largely confined myself to moderate Nominalisms and moderate Realisms. That host of contemporary philosophers who unreflectively substitute classes of particulars for properties and relations I take to be immoderate Nominalists. However, many of the arguments

that I bring against the more moderate Natural Class theory are also arguments against this orthodoxy. I would also classify Quine as an extreme Nominalist (although he himself would not, on the grounds that he recognizes classes and that these are "abstract" or "platonic" entities)." From the Preface.

"Brushing aside the uneconomical view that admits both tropes and universals, we have a choice in Trope theory between natural class and resemblance views. The same sort of consideration that favors resemblances rather than natural classes of "regular" particulars seems to me to favor a Trope theory with resemblance. And although it is orthodox to bundle the tropes, I doubt if they are really well suited to be the substance of the world. We do better, with Locke and C. B. Martin, to hold the trope view in a substance-attribute form.

Our final two contenders, then, I suggest, are a Universals theory and a Trope Resemblance theory, each held in a substance-attribute form. How do we adjudicate between these two?

The Trope theory in its resemblance and substance-attribute form seems to me to face two unpleasantnesses. The first is relatively minor. It is the possibility of swapping exactly resembling tropes, to which attention was drawn in Section IX of Chapter 6. It is a somewhat implausible 'possibility', and is excluded by the substitution of universals for tropes.

The second difficulty is more serious, I think. It is the fact that the features of resemblance, what we have called the Axioms of Resemblance, would be explained with the greatest naturalness, simplicity, and economy if resemblance of nature was always identity of nature, either partial or complete identity. The difficulty, it will be remembered, is that the Axioms of Resemblance can be derived from the properties of identity provided that it is allowed that resemblance can be analyzed in terms of identity, that is, in terms of universals (Chapter 5, Section X). A Resemblance theory must treat this as a mere metaphysical coincidence between the properties of resemblance and the properties of identity. It is a serious

difficulty for any resemblance analysis that the irreducibility of resemblance is so implausible an irreducibility.

What of the difficulties faced by the Universals theory? It might be thought that a great difficulty lies in its strange primitive: the cross-categorial and fundamental tie or nexus of instantiation. The Resemblance theory has no such problem because its tie of resemblance is an internal relation, supervening upon the particularized natures of the resembling things.

I do not think that instantiation involves any special difficulty for the Universals theory. Barring the postulation of a special nontransferability for tropes, we have seen the need for states of affairs for all layer-cake theories, including those involving tropes. If tropes are the attributes of substances, which I have argued is the best view of the matter, then a fundamental tie or nexus is involved, that is, there will be states of affairs involving substances, which are particulars, having properties, and also substances standing in relation to each other. If the bundle conception is correct, then a bundling tie (compresence) is still involved, and relations hold between bundles. Instantiations are just states of affairs involving universals and seem to involve no more paradox or difficulty than states of affairs involving tropes.

Where I do see trouble for a Universals theory is the question of the resemblance of universals. Once universals are admitted, it must also be admitted that universals themselves can be ordered and grouped by resemblance relations. These relations, however, involve less than exact resemblance. (Two universals could not resemble exactly!)

The vital question, then, is whether this less than exact resemblance of universals is or is not analyzable. My idea is that it is analyzable, analyzable in terms of a partial, an incomplete, identity of constituents of the universals involved, where these constituents are themselves universals. (In a Trope Resemblance theory, it would be a matter of exact resemblance of some, but only some, constituents of the inexactly resembling tropes.)

If this analysis of the inexact resemblance of universals can be carried through, then the Universals theory is considerably strengthened. But if it cannot be carried through, the theory is weakened, because the inexact resemblances will presumably have to be taken as unanalyzable primitives, strengthening the notion that exact resemblance is no more than the highest degree of this primitive.

So, a great deal turns on whether the analysis of the inexact resemblance of universals can be carried through. I think that it can be carried through, but it faces some formidable ontological and epistemological difficulties. A key question here is the nature of quantities. A quantity is for me a family of property universals bound together by inexact but systematic resemblances, but resemblances that involve identical constituents of the universals involved (see Armstrong - *Are quantities relations?* 1988). Here is an important area for further work." pp. 136-138.

3. ———. 1989. *A Combinatorialist Theory of Possibility*. Cambridge: Cambridge University Press.

   Contents: Preface IX-XII; Part I: Non-naturalist theories of possibility. 1. The causal argument Part II: A combinatorial and naturalist account of possibility. 3; 2. Non-naturalist theories of possibility 14; 3. Possibility in a simple world 37; 4. Expanding and contracting the world 54; 5. Relative atoms 66; 6. Are there *de re* incompatibilities and necessities? 77; 7. Higher-order entities, negation and causation 87; 8. Supervenience 103; 9. Mathematics 119; 10. Final question: logic 138; Works cited 141; Appendix: Tractarian nominalism by Brian Skyrms 145; Index 153.

   "What is put forward in this essay is a new version of the metaphysic of Logical Atomism. It is a Logical Atomism completely purged of semantic and epistemic atomism. The idea that one can reach the atoms by analysing meanings is utterly rejected. In general, it is not for philosophers to say what the fundamental constituents of the world are. That question is to be settled a posteriori. It is a question for total science.

The version of Logical Atomism put forward here even abstracts from the question of whether there are any atoms at all at the bottom of the world. That too is a question to be decided a posteriori, if it can be decided at all. In Chapter 5 I argue that Logical Atomism can still be sustained even if we never get past merely relative atoms.

But if there may be no genuine atoms, why continue to speak of Logical! Atomism? I do so because, with a little qualification, the scheme presented cleaves to the fundamental idea that the states of affairs into which the world divides (Wittgenstein's and Russell's atomic facts) are logically independent of each other. Each one is, as I will say, distinct from every other.

This becomes the basis of what I think is a simple (and naturalistic) Combinatorial theory of possibility. In his article 'Tractarian Nominalism' (*) Brian Skyrms sketches a metaphysics of facts (states of affairs, as I put it), facts having as constituents individuals and universals (the latter divided into properties and relations). I had already argued for such a position in my book Universals and Scientific Realism (1978). What I had not noticed was what Skyrms pointed out: that this could become the basis for a theory of possibility. The present work is an attempt to develop Skyrms's insight. With his approval, and the permission of the D. Reidel Publishing Company, his article is reprinted at the end of this volume as an appendix." (From the Preface)

4. Armstrong, David Malet, Martin, Charles Burton, and Place, Ullin Thomas. 1996. *Dispositions. A Debate*. New York: Routledge.

Edited and with an introduction by Tim Crane.

Contents: List of authors VII-VIII; Part I. The Armstrong-Place debate; 1. D. M. Armstrong: Dispositions as categorical states 15; 2. U. T. Place: Dispositions as intentional states 19; 3. D. M. Armstrong: Place's and Armstrong's views compared and contrasted 33; 4. U. T. Place A conceptualist ontology 49; Part Ii. The Martin-Armstrong-Place debate; 5. C. B. Martin:

Properties and dispositions 71; 6. D. M. Armstrong: Reply to Martin 88; U. T. Place: Structural properties: categorical, dispositional or both? 105; 8. C. B. Martin: Replies to Armstrong and Place 126; D. M. Armstrong: Second reply to Martin 147; 10. U. T. Place: Conceptualism and the ontological independence of cause and effect 153; 11. C. B. Martin: Final replies to Place and Armstrong 163; Index 193.

"This book is about the nature of dispositional properties, or dispositions.

is hard to give an uncontroversial definition of the notion of a disposition, since its very definition is one of the matters under dispute. But we can make a start with the following preliminary definition: a disposition is a property (such as solubility, fragility, elasticity) whose instantiation entails that the thing which has the property would change, or bring about some change, under certain conditions. For instance, to say that some object is soluble is to say that it would dissolve if put in water, to say that something is fragile is to say that it would break if «or instance) dropped in suitable circumstances; to say that something is elastic is to say that it would stretch when pulled. The fragility elasticity) is a disposition; the breaking (dissolving, stretching is the manifestation of the disposition.

The contemporary philosophical controversy over dispositions is the descendant of earlier disputes - for example, Aristotle's view of actualities and potentialities, and Locke's view of secondary qualities as 'powers'. The recent interest in dispositions arose in two main areas of philosophy: the philosophy of science and the philosophy of mind. The interest in dispositions in the philosophy of science resulted from the logical empiricists' worries about unobservables - how could the whole of physics be expressed in terms of propositions about sense-experiences if physics requires attribution of dispositional qualities, which need have no manifestation in sense-experience?' The interest in dispositions in the philosophy of mind largely arose through behaviourist definitions of belief and other mental states, according to which belief is a disposition to act and/or to speak. Among the

questions with which the philosophy of mind grappled were: how should such dispositions be defined, and what explains the possession of such dispositions?

The three participants in the present Debate have all made substantial contributions to the philosophy of mind in the last fifty years. U.T. Place is well-known as one of the originators (with Herbert Feigl) of the mind-brain identity theory - and his work influenced other pioneers such as J.J.C. Smart. D.M. Armstrong was one of the first to develop in detail a causal theory of the mind. C.B. Martin had already been an early proponent of the causal theory of mind, and played a crucial role in the development of the philosophy of mind in Australia, which then spread throughout the rest of analytic philosophy's world. Part of Martin's role in influencing the shift from behaviourism to physicalism and functionalism was to insist on the importance of what carne to be called the 'Truthmaker Principle': the principle that when a statement is true, there must be something (some fact or event or property) that makes it true?

Each of these three philosophers has developed a distinct conception of the nature of dispositions, conceptions which are central in their thought on mind, matter and causation. In this Introduction I shall give a brief guide to the difference between them. In order to do this I need to say something (not wholly impartial) about the recent background to the debate about dispositions, and a little about how to characterize dispositional and categorical properties." (From the Introdcution by Tim Crane, pp. 1-2).

5. Armstrong, David Malet. 1997. *A World of State of Affairs*. Cambridge: Cambridge University Press.

   Contents: Preface XI; -XIII; 1. Introduction 1; 2. Some preliminary doctrines 11; 3. Properties I 19; 4. Properties II 47; 5. Powers and dispositions 69; 6. Relations 85; 7. Particulars 95; 8. States of affairs 113; 9. Independence 139; 10. Modality 148; 11. Number 175; 12. Classes 185; 13. Totality states of affairs 196; 14. Singular causation 202; 15. Laws I 220; 16. Laws

Ii 242; 17. The unity of the world 263; References 270; Index 277.

"During the past twenty years or so, I have been working on ontological questions. What are universals, laws of nature, dispositions and powers, possibilities and necessities, classes, numbers? The present essay tries to bring all these topics together in a unified metaphysical scheme, an ontology. As a result, there is a certain amount of recapitulation of earlier writing. But putting the pieces together turned out to be quite difficult. A good deal of further work was necessary. Many mistakes, as I now think of them, had to be corrected. So what follows is not a mere sum of past thinking." (From the Preface)

"The hypothesis of this work is that the world, all that there is, is a world of states of affairs. Others, Wittgenstein in particular, have said that the world is a world of facts and not a world of things. These theses are substantially the same, though differently expressed.

The general structure of states of affairs will be argued to be this. A state of affairs exists if and only if a particular (at a later point to be dubbed a *thin* particular) has a property or, instead, a relation holds between two or more particulars. Each state of affairs, and each constituent of each state of affairs, meaning by their constituents the particulars, properties, relations and, in the case of higher-order states of affairs, lower-order states of affairs, is a contingent existent. The properties and the relations are universals, not particulars. The relations are all external relations.

It is useful to admit *molecular* states of affairs. These, however, are mere conjunctions (never negations or disjunctions) of the original states of affairs. Molecular states of affairs constitute no ontological addition to their conjuncts. But in one special case, to be mentioned in a moment, they become very important.

For first-order states of affairs, that is, states of affairs that do not have states of affairs as constituents, the Tractarian thesis of Independence is somewhat speculatively, but nevertheless

hopefully, advanced. No such state of affairs entails or excludes the existence of any other wholly distinct state of affairs. Given Independence, a rather simple and straightforward Combinatorial theory of what possibilities there are, can be put forward. If Independence fails, things get more complicated.

The present theory is not biased towards Atomism nor is it biased against Atomism. An *epistemic* possibility that requires to be noted is the possibility that every (first-order) state of affairs is molecular, that is, analysable into a conjunction of states of affairs. (A simple if to a degree controversial example: *a*' being F may be equivalent to *a*'s being G & a' being H, with F=G & H. The pattern may be repeated for G and H, and so for ever.) Every first-order state of affairs may be a nest of first-order states of affairs: states of affairs all the way down. To allow for this epistemic possibility, a Combinatorial theory of what possibilities there are requires further elaboration." pp. 1-2.

6. ———. 2004. *Truth and Truthmakers*. Cambridge: Cambridge University Press.

   Contents: Preface XI-XII; 1. An introduction to truthmakers 1; 2. The general theory of truthmaking 4; 3. Epistemology and methodology 26; 4. Properties, relations and states of affairs 39; 5. Negative truths 53; 6. General truths 68; 7. Truthmakers for modal truths, part 1: possibility 83; 8. Truthmakers for modal truths, part 2: necessity 95; 9. Numbers and classes 112; 10. Causes, laws and dispositions 125; 11. Time 145; References 151; Index 155.

   "To postulate certain truthmakers for certain truths is to admit those truthmakers to one's ontology. The complete range of truthmakers admitted constitutes a metaphysics, which alerts us to the important point, stressed already but bearing much repetition, that the hunt for truthmakers is as controversial and difficult as the enterprise of metaphysics. I think that proceeding by looking for truthmakers is an illuminating and useful regimentation of the metaphysical enterprise, or at least the enterprise of a realist metaphysics. But it is no easy and automatic road to the truth in such matters.

But this raises the question of Quine, and the signalling of ontological commitment by what we are prepared to 'quantify over'. Why should we desert Quine's procedure for some other method? The great advantage, as I see it, of the search for truthmakers is that it focuses us not merely on the metaphysical implications of the subject terms of propositions but also on their *predicates*. Quine has told us that the predicate gives us 'ideology' rather than ontology. (*) This saying is rather dark, but it is clear that, to some degree, he has stacked the ontological deck against predicates as opposed to subject terms. But when we look to truthmakers for truths, subject and predicate start as equals, and we can consider the ontological implications of both in an unbiased way.

The doing of ontological justice to the predicate leads us to consider whether we do not require at least selected properties and relations in our ontology. If properties and relations are admitted, we may think that some ontological connection between subjects and predicates is further required, and thus, perhaps, be led to postulate facts or states of affairs among our truthmakers. The propositional nature of truths will in any case push us in the same direction. The existence of negative truths and general truths raises the question whether negative and general facts are required as truthmakers. Ali these difficult metaphysical issues (which will receive discussion in chs. 5 and 6) tend to be swept under the carpet by correlating one's ontology with the subject term only of truths (what one takes to be truths).

Some may argue that what I see here as advantages of thinking in terms of truthmakers are actually disadvantages. The world is a world of things not of facts, it may be said, and so we do not want facts, and the nightmare of such entities as negative facts, in our ontology. This is an arguable position, of course, but, conceding it true for the sake of argument, it can still be accommodated by a doctrine of truthmakers. Let the world be a world of things. The fundamental truths (those that have unique minimal truthmakers) will then have the form 'X exists' and the Xs, whatever they may be, will be truthmakers for these truths." pp. 23-24

(*) Quine writes: 'In science all is tentative, all admits of revision . But ontology is, pending revision, more clearly in hand than what rnay be called *ideology* - the question of admissible predicates' (Quine, *The way of paradox and other essay,* New York, Random House, 1966, p. 232).

Essays

1. ———. 1972. "Materialism. Properties and Predicates." *Monist* no. 56:163-176.

   "How are contingent identifications ('heat is mean kinetic energy') possible? It is argued, first, that we require a realistic (but not Platonistic) theory of properties. second, that we must reject the common assumption that to each distinct predicate there corresponds its own peculiar property. Contingent identification occurs where two distinct predicates apply to the same object or objects in virtue of just one property of that object."

Theory and History of Ontology

Raul Corazzon || e-mail: rc@ontology

Bogusław Wolniewicz on the Formal Ontology of Situations

Introduction

"The theory presented below was developed in an effort to clarify the metaphysics of Wittgenstein's Tractatus. The result obtained, however, is not strictly the formal twin of his variant of Logical Atomism. but something more, general, of which the latter is lust a special case. One might call it an ontology of situations. Some basic ideas of that ontology stern from Stenius Wittgenstein's Tractatus, Oxford, 1968 and Suszko Ontology in the Tractatus of L. Wittgenstein - Notre Dame Journal of Formal Logic, 1968.

Let L be a classic propositional language. Propositions of L are supposed to have their semantic counterparts in the realm of possibility, or as Wittgenstein put it: in logical space. These counterparts are situations, and S is to be the totality of them. The situation described by a proposition a is S(a). With Meinong we call it the objective of a." (pp. 381-382)

From: Bogusław Wolniewicz, "A Formal Ontology of Situations", *Studia Logica* 41, 1982, pp. 381-413.

"Different ontologies adopt different notions of existence as basic. Aristotle's paradigm of existence is given by the equivalence:

(A) to be = to be a substance.

On the other hand, the paradigm of existence adopted in Wittgenstein's Tractatus is given by the parallel equivalence:

(W) to be = to be a fact.

Now, an Aristotelian substance is the denotation of an individual name, whereas a Wittgensteinian fact is the denotation of a true proposition. It seems therefore that the notions of existence derived from these two paradigms should be quite different, and one might readily expect that the metaphysical systems erected upon them will display wide structural discrepancies.

It turns out, however, that in spite of this basic difference there runs between these two systems a deep and striking parallelism. This parallelism is so close indeed that it makes possible the construction of a vocabulary which would transform characteristic propositions of Wittgenstein's ontology into Aristotelian ones, and conversely. To show in some detail the workings of that transformation will be the subject of this paper.

The vocabulary mentioned is based on the following four fundamental correlations:

Aristotle

1) primary substances *(substantiae primae*)

2) prime matter (*materia prima*)

3) form (*forma*)

4) self-subsistence of primary substances (*esse per se*)

Wittgenstein

1) atomic facts

2) objects

3) configuration

4) independence of atomic facts

Aristotle's ontology is an ontology of substances, Wittgenstein's ontology is an ontology of facts. But concerning the respective items of each of the pairs (1)-(4) both ontologies lay down conditions which in view of our vocabulary appear to be identical. To show this let us confront, to begin with, the items of pair (1): substances and facts.

(The interpretation of Aristotle adopted in this paper is the standard one, to be found in any competent textbook of the history of

philosophy. Therefore, with but one exception, no references to Aristotle's works will be given here.)Relatively to the system involved substances and facts are of the same ontological status. Aristotle's world is the totality of substances (summa rerum), Wittgenstein's world is the totality of facts (die Gesamtheit der Tatsachen). For Aristotle whatever exists in the basic sense of the word is a primary substance, for Wittgenstein - an atomic fact. Moreover, both ontologies are MODAL ones, allowing for different modes of being (modi essendi); and both take as basic the notion of 'contingent being' (esse contingens), opposed to necessary being on the one hand, and to the possibility of being on the other. Both substances and facts are entities which actually exist, but might have not existed. The equality of ontological status between substances and facts is corroborated by the circumstance that both are PARTICULARS, there being - as the saying goes - no multiplicity of entities which FALL UNDER them.

Substances and facts stand also in the same relation to the ontological categories of pairs (2) and (3). Both are always COMPOUND entities, a substance consisting of matter and form, and a fact consisting of objects and the way of their configuration. But in neither of the two systems is this compoundness to be understood literally as composition of physically separable parts or pieces. The compoundness (compositio) of a substance consists in its being formed stuff (materia informata), and the compoundness of a fact in its being a configuration of objects.

In view of correlation (4) we have also an equality of relation which a substance bears to other substances, and a fact to other facts. Self-subsistence is the characteristic attribute of primary substances: substantia prima = ens per se. If we take this to mean that each substance exists independently of the existence or non-existence of any other substance we get immediately the exact counterpart of Wittgenstein's principle of logical atomism stating the mutual independence of atomic facts. It should be noted that thus understood the attribute of self-subsistence or independence is a relative one, belonging to a substance - or to a fact - only in virtue of its relation to other substances - or facts.

From a Wittgensteinian point of view Aristotle's substances are not things, but hypostases of facts, and thus their names are not logically proper names, but name-like equivalents of propositions. (By that term we mean roughly either a noun clause of the form 'that p', or any symbol which might be regarded as a definitional abbreviation of such clause.) Surely, from the Aristotelian point of view it might be easily retorted here that just the opposite is the case: substances are not 'reified' facts, but on the contrary - facts are 'dereified' substances. Without passing judgement on these mutual objections let us note in passing that their symmetric character seems to be itself an additional manifestation of the parallelism discussed." (pp. 208-210, notes omitted)

From: Bogusław Wolniewicz, "A Parallelism Between Wittgensteinian and Aristotelian Ontologies", in: Robert S. Cohen and Marx Wartofsky (eds.), *Boston Studies in the Philosophy of Science*, Vol. IV, Dordrecht: Reidel 1969, pp. 208-217.

Wolniewicz on Wittgenstein's Tractatus

"The *Tractatus* is a masterpiece of rare power and ravishing beauty. Its content is a profound and highly coherent philosophy of language, based upon a radically new kind of metaphysics: the metaphysics of facts and situations. (Meinong, with his notion of the 'objective' of a proposition, apparently was moving in the same direction. But he never came near asking himself any of the two crucial questions: (1) When, if ever, are the objectives of different propositions identical? (2) What, if any, is the relation of the objective of a compound proposition to the objectives of its components?) Moreover, the *Tractatus* anticipated many of the later developments of logical semantics, especially those commencing around 1950 and connected with its algebraization. The kernel of its message may be put down as follows. The fundamental problem of the *Tractatus*, as of all philosophy, concerns the relationship of thought and reality. This relationship is mediated by language, and so it may be decomposed into the relative product of two relations: one between thought and language, the other between language and reality. Let us mark the latter by 'f', the former by '?'.

It has been maintained that according to the *Tractatus* the projective relation f between language and reality has to be an isomorphism. This, however, is not borne out by the text. To satisfy the conditions laid down by Wittgenstein it is enough for to be a *homomorphism*, and this already makes a lot of a difference. In the first place, we are confronted now with two delicate questions: (1) Which is the direction of that homomorphism: from language to reality, or the other way round? (2) Is it a homomorphism *onto*, or merely one *into*? Neither of these questions has a trivial answer in the context of the *Tractatus*.

We assume here that the relation f is a homomorphism on the language *L* onto the reality *R*, i.e., that f: *L* ? R. Thus reality is a homomorphic image of language. But language is the totality of propositions, and the reference of meaningful propositions are possible situations. Consequently, reality is not the world, but the logical space; i.e., it is not the totality of facts, but the totality of possibilities. Thus language is more capacious than the world, and the number of propositions is greater than even that of situations.

The simplest non-trivial homomorphism of that kind is the well-known Fregean one. Language is mapped under it onto the set of the two classic truth-values, and the corresponding two-element Boolean algebra is then the logical space. Thus for Frege there are just two possible situations: the True and the False. This is so because his only stipulation with regard to the reference of propositions is that *contradictory* propositions cannot have the same reference. In the *Tractatus*, however, it is stipulated further that logically *independent* propositions cannot have the same reference either. This move is the gist of its logical atomism, transforming the Fregean homomorphism f: *L* ? {1,0} into the composition of two other ones: f' on *L* onto logical space, and f' ' on logical space onto the set of truth-values. (1)

The aim of the *Tractatus* was to trace the boundaries of clear thought:

Philosophy... should trace the unthinkable from within by means of the thinkable. By presenting clearly what may be expressed it will point to the inexpressible. (2)

The positivistically-minded members of the Vienna Circle deemed to recognize in these words their own 'demarcation problem', together with their own hostility towards 'metaphysics' and their cult of 'science'. It was a monumental misunderstanding. To Wittgenstein the metaphysical is indeed the inexpressible, but this is not to mean that it is regarded as some kind of delusion or hoax. On the contrary, the hoax is the idea of a 'scientific philosophy'.

In the *Tractatus* the tracing of the boundaries of the inexpressible was to be accomplished at one stroke. Logical space *R* fills the realm of the expressible *E* completely, i.e., we have $E = R$. Consequently, the homomorphism f' is onto the expressible, and what is left, evidently, is only the inexpressible. This grandiose project, however, was soon to encounter grave technical difficulties, and then Wittgenstein simply dropped it. This was rash. Not all the difficulties were quite as insuperable as they might have seemed, and the *Tractatus* left room for manœuvre. It might have been helpful, for instance, to weaken the homomorphism f' to one *into* the expressible. Then instead of the one language *L* we could consider a whole series of languages $L_0, L_1, \ldots$, and a corresponding series of logical spaces $R_0, R_1, \ldots$ The realm of the inexpressible would be approximated by the latter 'from within', starting from what is expressible in the language L_0 at hand. Certainly, the series of logical spaces need not be monotonic, and in advance there would be no telling whether what is inexpressible at a given stage L_1 is absolutely or only relatively so. Thus the final tracing of the boundaries of the inexpressible would recede to infinity, but for theory this could hardly count as an objection." (pp. 77-79)

Proceedings of the Second International Wittgenstein Symposium, 29th August to 4th September 1977, Kirchberg/Wechsel (Austria)*, edited by Leinfellner, Elisabeth, 174-176. Wien: Hölder-Pichler-Tempsky.

9. ———. 1978. "Situations as the Reference of Propositions." *Dialectics and Humanism* no. 5:171-182.

   "The reference of propositions is determined for a class of languages to be called the "Wittgensteinian" ones. A meaningful proposition presents a possible situation. Every consistent conjunction of elementary propositions presents an elementary situation. The smallest elementary situations are

the "Sachverhalte"; the greatest are possible worlds. The situation presented by a proposition is to be distinguished from that verifying it, but the greatest situation presented is identical with the smallest verifying. The reference of compound propositions is then determined as a function of their components."

10. ———. 1978. "Objectives of Propositions." *Bulletin of the Section of Logic* no. 7:143-147.

    "The paper sketches out a semantics for propositions based upon the Wittgensteinian notion of a possible situation. The objective of a proposition is defined as the smallest situation verifying it. Two propositions are assumed to have the same objective iff they are strictly equivalent. Formulas are given which determine the objectives of conjunction and disjunction as functions of the objectives of their components. finally a link with possible-world semantics is established."

11. ———. 1978. "Wittgenstein Und Der Positivismus." In *Wittgenstein, the Vienna Circle and Critical Rationalism. Proceedings of the Third International Wittgenstein Symposium, 13th to 19th August 1978, Kirchberg Am Wechsel (Austria)*, edited by Bergehel, Hal, Hübner, Adolf and Eckehart, Köhler, 75-77. Wien: Hölder-Pichler-Tempsky.

12. ———. 1978. "Les Situations Comme Corrélats Semantiques Des Enoncés." *Studia Filozoficzne* no. 2:27-41.

13. ———. 1979. "A Wittgensteinian Semantics for Propositions." In *Intention and Intentionality. Essay in Honour of G. E. M. Anscombe*, edited by Diamond, Cora and Teichman, Jenny, 165-178. Ithaca: Cornell University Press.

    "More than once Professor Anscombe has expressed doubt concerning the semantic efficacy of the idea of an 'elementary proposition' as conceived in the *Tractatus*. Wittgenstein himself eventually discarded it, together with the whole philosophy of language of which it had been an essential part. None the less the idea is still with us, and it seems to cover theoretical potentialities yet to be explored. This paper is a tentative move in that direction.

According to Professor Anscombe, (*) Wittgenstein's 'elementary propositions' may be characterized by the following five theses:

(1) They are a class of mutually independent propositions.

(2) They are essentially positive.

(2) They are such that for each of them there are no two ways of being true or false, but only one.

(4) They are such that there is in them no distinction between an internal and an external negation.

(5) They are concatenations of names, which are absolutely simple signs.

We shall not investigate whether this is an adequate axiomatic for the notion under consideration. We suppose it is. In any case it is possible to modify it in one way or another, and for the resulting notion still to preserve a family resemblance with the original idea. One such modification is sketched out below."

14. ———. 1979. "Some Formal Properties of Objectives." *Bulletin of the Section of Logic* no. 8:16-20.

    "The objectives of propositions as defined in an earlier paper are shown here to form a distributive lattice."

15. ———. 1980. "On the Lattice of Elementary Situations." *Bulletin of the Section of Logic* no. 9:115-121.

16. ———. 1980. "On the Verifiers of Disjunction." *Bulletin of the Section of Logic* no. 9:57-59.

17. ———. 1981. "The Boolean Algebra of Objectives." *Bulletin of the Section of Logic* no. 10:17-23.

    "This concludes a series of papers constructing a semantics for propositional languages based on the notion of a possible "situation". Objectives of propositions are the situations described by them. The set of objectives is defined and shown to be a boolean algebra isomorphic to that formed by sets of possible worlds."

18. ———. 1982. "A Formal Ontology of Situations." *Studia Logica* no. 41:381-413.

    "A generalized Wittgensteinian semantics for propositional languages is presented, based on a lattice of elementary situations. Of these, maximal ones are possible worlds, constituting a logical space; minimal ones are logical atoms, partitioned into its dimensions. A verifier of a proposition is an elementary situation such that if real it makes true. The reference (or objective) of a proposition is a situation, which is the set of all its minimal verifiers. (Maximal ones constitute its locus.) Situations are shown to form a Boolean algebra, and the Boolean set algebra of loci is its representation. Wittgenstein's is a special case, admitting binary dimensions only."

    "The scientific world-view is one of the fundamentals of our culture. It can be characterized in part by its specific system of values. A world-view is regarded as a scientific one if "truth" is one of its primary values, that is, as a value which is not a means, but an end in itself. Truth is served in particular by the two instrumental values of conceptual clarity and openness to critique. Their standing is (at present) low, for two reasons. (1) Unclear thinking not only promotes social idols; its consequences are also often difficult to see clearly and immediately. (2) In any case truth is of no interest (in a

biological sense) to human beings; therefore, critique can at best be a socially tolerated activity. On the other hand, truth is not only a value, but also a force which in the long run cannot be held back; this fact gives some hope to adherents of the scientific world-view. "

    Reprinted in: *Logic and metaphysics* (1999) - pp. 286-292 (with the title: *Elzenberg's axiology*"

    "1. Values are what our value-Judgements refer to, and the passing of Judgements is one of our vital activities, like sleeping and breathing. We constantly appraise things as good or bad, pretty or ugly, as noble or base, well-made or misshapen. No wonder that both the act of appraisal and that which it refers to - i.e. the real or spurious values - have been always the source

of philosophical reflexion. In systematic form such reflexion is what we call *axiology*.

In Polish philosophy it was Henryk Elzenberg (1887-1967) who reflected upon matters of axiology most deeply and incisively.

(...)

3. Leibniz had said somewhere: "There are two mazes in which the human mind is most likely to get lost: one is the concept of continuity, the other is that of liberty". This admits of generalization: all concepts are mazes, *viz* mazes of logical relations between the propositions that involve them.

One such maze is the concept of 'value'. Possibly, it is even the same as one of the two mentioned by Leibniz, only entered - so to say - by another door. For it would be in full accord with Elzenberg's position - and with that of Kant too - to adopt the following characteristic: values are what controls the actions of free agents. Thus the concepts of value and of liberty should constitute one conceptual maze, or - which comes to the same - two mazes communicating with each other.

To get a survey of such logical maze the first thing is to fix the ontological category of the concept in question. Thus, in our case, we ask what kind of entities are those 'values' supposed to be. (Ontological categories are the most general classes of entities, the *summa genera* A term even more general has to cover literally everything: like 'entity' or 'something'. For everything is an entity, just as everything is a something.)

Different ontologies admit different sets of categories. The categories most frequently referred to are those of 'objects', 'properties', and 'relations'; the more exotic ones are those of an 'event', a 'set', a 'function', or a 'situation'. One point, however, is of paramount importance: the categories admitted *In* one ontology have to be mutually disjoint". p. 63; 66.

    "How is Wittgenstein's later philosophy related to his earlier one?

    Despite much discussion there is little clarity on that. So let us give it again some consideration.

    (...)

    Philosophy of language oscillates between the two poles of metaphysics and psychologism; (...) . The main representative of the former trend is Frege, and the *Tractatus* follows closely in his wake. The *Philosophical Investigations,* on the other hand, are the expression of a dramatic departure from Frege and towards psychologism. Language is now viewed by Wittgenstein not in its logical capacity as the medium of thought and the bearer of truth-value, but instrumentally as a means of communication. Its relation to reality fades out, and its connexion with feeling, thinking, and doing comes massively to the fore.

    Psychologism and positivism go hand in hand. Metaphysics, though not condemned as a vice as in pure positivism, is viewed as a malaise to be cured. Thus Wittgenstein's later philosophy turns into a kind of psychotherapy, exerting itself to bring metaphysics to a stop. What for? This is never made clear, as if it were a matter of course. But it is not." (pp. 80-81)

    "Elaborating on Wittgenstein's ontology of facts, semantic frames are described axiomatically as based on the notion of an elementary situation being the verifier of a proposition. Conditions are investigated then for suchframes to be atomic, i.e. to have lattice-theoretic counterparts of his "Sachverhalte"."

42. ———. 2001. "Extending Atomistic Frames." *Logica Trianguli* no. 5.

    "A "semantic frame" is bounded join-semilattice of *elementary situations*, with its maximal ideals to represent possible worlds and mapped into the complete sets of propositions determined by a given abstract logic (*L*, *Cn*). A frame is *Humean* if the elementary situations are separated by its possible worlds, and it is *atomistic* if the semilattice is so. One frame is the *extension* of another if the latter is an {0,1}-subsemilattice of the former satisfying certain conditions discussed."

43. ———. 2001. "Tractatus 5.541 - 5.542." In *Satz Un Sachverhalt*, edited by Neumaier, Otto, 185-190. Sankt Augustin: Academia Verlag.

"In Wittgenstein's "Tractatus", thesis 5 is the Principle of Extensionality: all propositions are truth-functions of their clauses. This, however, has been often thrown into doubt. There are - it is said - compound propositions whose truth-value does not depend on that of their clauses. The usual example given are the so-called intensional contexts, like "John thinks that p", or "John says that p". And indeed, the truth-value of "p" is patently immaterial here to that of the whole proposition which it is part of.

Wittgenstein's retort are the following much discussed theses, adduced here in a translation of our own:

5.54 In the general propositional form, propositions occur in one another only as bases of truth-operations.

5.541 At first sight it seems that a proposition might occur in another also in a different way.

Particularly in certain propositional forms of psychology, like "A believes that p is the case", "A thinks p", etc.

For taken superficially, proposition p seems here to stand to the object A in some sort of relation.

(And in modem epistemology - Russell, Moore, etc. - these have actually been construed that way.)

5.542 However, "A believes that p", "A thinks p", "A says p" are clearly of the form " 'p' says p "; and this is not correlating a fact with an object, but a correlation of facts by correlating their objects.

The objection is met here in two steps. Firstly, it is pointed out that a proposition of the form "John says that p" is actually of the form "'p' says that p". The idea is this: the proposition "John says that Jill has a cat" means: John produces the sentence "Jill has a cat", the latter saying by itself *that* Jill has a cat. In such a way propositions get independent of the persons

producing them, and communicate some objective content. It is surely not by John's looks that we come to know about Jill's cat, but merely by his words. Whom they stem from, is irrelevant.

In his second step Wittgenstein follows Frege's interpretation of indirect speech, but with modifications. He points out that the formula " 'p' says that p " is equivalent to some compound proposition in which neither the proposition *"p" as a* syntactic unit, nor anything equivalent to it, does occur although there occur all the logically relevant constituents of *"p"* separately.

(...)

The distinction between abstract and concrete states of affairs is not drawn explicitly in the "Tractatus". But it fits well thesis 5.156, if we expand that thesis by a few words of comment, added here in brackets:

5.156(d) A proposition may well be en incomplete image of a particular (concrete) situation, but it is always *the* complete image (of an abstract one).

The circumstance that in 5.156 not "states of affairs", but "situations" are mentioned, is of no consequence in our context. We assume that states of affairs are just atomic situations, and so the distinction between "concrete" and "abstract" applies to both."

44. ———. 2003. "Extending Atomistic Frames: Part Ii." *Logica Trianguli* no. 6:69-88.

"The paper concludes an earlier one (Logica Trianguli, 5) on extensions of atomistic semantic frames. Three kinds of extension are considered: the adjunctive, the conjunctive, and the disjunctive one. Some theorems are proved on extending "Humean" frames, i.e. such that the elementary situations constituting their universa are separated by the maximally coherent sets of them ("realizations")."

Reinhardt Grossmann and the Ontology of Categories

Ontology, categories and the world

"Ontology, I said at the beginning, asks what the categories of the world are. What is a category? It is a kind of entity. What kind of kind? In answer to this question, we can only give examples. It is that sort of kind, as we have seen, that distinguishes between individuals, on the one hand, and properties on the other. It is that sort of kind, as we have noted, which obeys a certain kind of law, namely, categorial laws. But this reply does not really help much either. We must therefore rest content, as on so many other occasions, with examples rather than definitions. In these most fundamental matters of metaphysics, definitions are impossible." (p. 5)

"The world, I said earlier, is the ultimate object of ontological analysis. But this world must be distinguished from the physical universe. The universe is a complicated spatio-temporal structure. Facts, on the other hand, do not form such a structure. It follows, as Armstrong fails to realize, that a world consisting of facts cannot be identical with the universe. (D. M. Armstrong, *Universals and Scientific Realism,* 1978, vol. 1, pp. 126-135.) But if the world is not the same as the universe, to what category does it belong? There are a number of plausible answers. It may be said that the world is the totality of entities. Or it may be claimed that it is the totality of facts. (Compare L. Wittgenstein, *Tractaus Logico-philosophicus* 1961, p. 7.) If these answers imply that the world belongs to the category of class, then I think that they are wrong. But I must admit that I do not know how to argue for my view. I believe that the world is a fact; that it belongs to the category of fact. If this is the correct view, then we

can distinguish between two levels of ontological analysis. On the first level, the world can be analyzed into its constituent facts. On this level, we do not arrive at new categories, but discover the kinds of fact there are. We discover, in other words, the subcategories of the category fact. On the second level, we analyze facts which do not consist of further facts into their constituents. It is on this second level of analysis that we encounter the traditional categories of individual, property, relation, etc." (p. 8)

"Ontology asks what are the categories of the world. So far, I have tried to elucidate the crucial terms 'category' and 'world'. But I could have begun instead by saying that ontology attempts to categorize everything there is, and this alternative introduction would have led us earlier to a number of questions which we must now consider.There is an old and hallowed tradition, according to which being comes in many modes. One distinguishes, for example, between the existence of individual things and the mere subsistence of facts. Concrete things are said to exist, while abstract entities are held to subsist. But even though this view has been maintained by some of the recent philosophers I most admire -- by Bolzano, Frege, and Meinong, among others -- I do not think that it is correct. I do not believe that there are modes of being. Existence is the only kind of being there is. I shall later defend this belief. What is of primary interest to us right now is how the possibility of modes of being affects our conception of ontology. It seems to me clear that if there are modes of being, then it is the task of ontology to categorize all entities, irrespective of their particular modes of being. The field of ontology is as wide as the realm of being itself. But it is not any wider: What has no being cannot be categorized. What has no being cannot be the subject of ontology. Meinong, as we all know, would demur. According to him, there is an enterprise that deals, not only with existents and subsistents, but also with objects that have no being whatsoever; with objects like the golden mountain and the round square. And he claims that we are merely prejudiced if we exclude such objects from categorization. (A. Meinong, [*On the Theory of Objects*] 1904.) But Meinong's defense of a general theory of objects rests on an important assumption which I do not share. He maintains that objects without being may nevertheless have properties and stand in relations. He holds that the golden mountain

is golden, that the round square is both round and square. Now, if it were true that objects without being bristle with properties, then it would make sense to attempt to classify them, according to these properties. But if Meinong's assumption is mistaken, as I shall contend in a later chapter, then there simply can be no such classification; for one can only classify what has properties and stands in relations; what has, in short, attributes. My conviction that ontology cannot be extended beyond the realm of being thus rests on my rejection of the view that beingless objects can have attributes." (pp. 9-10)

Annotated Bibliography of Reinhardt Grossmann

Bibliography

A complete bibliography of the published writings of Reinhardt Grossmann and of the studies about his philosophy has been compiled by Javier Cumpa in the volume edited by him: *Studies in the Ontology of Reinhardt Grossmann* (2009), pp. 284-289; I give the list of the books and a selection of the most important articles.

Books

1. Grossmann, Reinhardt. 1965. *The Structure of Mind*. Madison: University of Wisconsin Press.

   Contents: 1. Introspection. Inspection of phenomenal objects - Awareness of mental acts - Sensing and perceiving 3; 2. Mental Acts. The relational view - Nonexistent objects - Brentano's idealism 39; 3. Presentation and Judgment: Universals - Concepts - Frege's conceptualism - Abstraction 60; 4. Meaning. Mental contents - Intentional contexts - The behavioristic approach 104; 5. Intentionality. Possible particulars - Possible states of affairs - The intentional nexus 144; 6. Realism. Direct and indirect knowledge - Perceptual and phenomenal objects - Delusive perceptual situations 180; Index 238-248.

   "This book avoids a number of traditional problems from the philosophy of mind. Emotions and volitions are hardly mentioned; and very little is said about imagination and memory. I am concerned in the main with only one topic: the realism-Idealism controversy. This concern explains why I

limited the discussion to thought and perception. It also explains why at times I had to go rather deeply into the problems of general ontology; for if my analysis is correct, the realism-idealism controversy arises from certain disagreements in general ontology.

Nor does this book deal with a number of currently fashionable topics. I say nothing on whether or not mental states are after all nothing but brain states. I do not discuss this point because I am convinced that there is nothing to be discussed. The correct answer to the question seems to me so obvious that I simply took it for granted in writing this book. The problem of our knowledge of other minds is of quite a different sort: it is, philosophically speaking, interesting and difficult. Since I do not discuss the problem, I may mention here that I consider all solutions in terms of so-called criteria for the application of expressions unsatisfactory. The one fashionable topic which I do discuss, though not under a separate heading and not in the movement's jargon, is the so-called private language argument. I am sure that the attentive reader can construct my position on this matter from the first chapter." (from the Preface).

Translated in Spanish as: *La estructura de la mente*. Barcelona, Labor, 1969.

2. ———. 1969. *Reflections on Frege's Philosophy*. Evanston: Northwestern University Press.

Contents: Editorial Foreword VII; Preface IX; Note XV-XVI; Chapter I. *Begriffschrift:* Three Confusions 3. Act and Content 5; Subject and Predicate 13; Identity and Description 19; Function and Argument 23; Chapter II. *Grundlagen*: Two Distinctions 28; Ideas 29; Concepts 50; Objects 83; Reduction 108; Chapter III. *Sinn und Bedeutung*: A Solution 153; Identity 154; Truth 181; Chapter IV. Later Papers: Second Thoughts 224; About Sense and Reference 226; About Definitions 248; Index 255-261.

"I chose the title "Reflections on Frege's Philosophy" rather than, say, "An Outline of Frege's Philosophy" because I wanted to indicate that this book is not a systematic treatise on all or even most of Frege's views. I did not set out to write an

exposition of Frege's philosophy, nor did I intend to provide a detailed commentary on his most important works.

My goal was rather modest in regard to Frege. I hoped to be able to discuss a few selected ontological problems within a very narrow setting. Frege's philosophy, as I found out, most conveniently provides such a setting. Not only does it center around the very questions which I wanted to take up, but it also deals with them in a manner which I find most congenial. Even though the ontological problems were foremost in my mind, however, I would be very pleased if my efforts contribute to a better understanding of Frege's philosophy as a whole.

(...)

It was clear to me from the beginning that Frege's views would have to be discussed with an eye on their gradual development. There are several definite stages in Frege's advancement, I believe, and his later views grow out of earlier ones. This conviction explains the structure of the present book. The first chapter is about the *Begriffschrift*. I tr *y* to uncover the origins of the main themes of Frege's philosophy. These themes have their roots, I think, in three basic confusions: subjective and objective entities are not sharply distinguished; objects are not clearly separated from concepts; and identity is conceived of at times as a relation between signs, and at other times as a relation between entities. In the second chapter, the emphasis is on two cornerstones of Frege's mature philosophy, namely, his distinction between objective and subjective entities, and his notion of the difference between objects and concepts. But his attempt to reduce Arithmetic to logic raises the unsolved problem of identity. These topics are discussed against the background of the *Grundlagen*. Frege's philosophical development reaches a second peak with the three classical papers published in 1891 and 1892. These articles, especially "Über Sinn and Bedeutung," explain Frege's views on identity and truth. Both of these views rest on his distinction between sense and reference. The third chapter is about that distinction and its consequences. Frege's later published and unpublished manuscripts contain modifications, qualifications, and second

thoughts about his earlier solutions. In Chapter Four I deal with some of these later ideas but this is rather an epilogue; the real drama occurs in the second and third chapter." (from the Preface).

(...)

"If, in conclusion, we look back at Frege's system, we see that another of its main flaws has been eliminated. What remains as before is Frege's conviction that there are senses -- both senses of proper names and Thoughts. I have argued that a correct ontology contains states of affairs instead of Fregean senses. What descriptions represent -- as distinguished from what they describe -- are states of affairs, not senses. What sentences represent are states of affairs, not Thoughts. The sense-reference distinction, Frege's most original and most famous metaphysical innovation, must be rejected. Some metaphysical mistakes are so profound that generations of philosophers continue to discuss and learn from them. This is such a mistake." (p. 253).

3. ———. 1973. *Ontological Reduction*. Bloomington: Indiana University Press.

   Contents: Preface 1; Introduction. A Principle of Acquaintance 3; Part One: Numbers and Quantifiers 29; Part Two: Properties and Classes 109; Part Three: Individuals and Structures 141; Conclusion: A List of Categories 177; Notes 191; Index 207-215.

   "The structure of this book requires a brief explanation. The philosophical inquiry proceeds simultaneously, as it were, on three different levels. First and foremost, there is the problem of the nature of a ()logical reduction. What reduction devices and methods have been proposed? How does one go about showing that a given ontological kind can be reduced to another? What kinds of definitions are important from a strictly ontological point of view? These and similar questions arise in connection with the main topic of this book I shall contend that most kinds of definitions have no reductive power whatsoever. On the positive side, I maintain that there are only two ways of showing that what is alleged to be an ontological kind reduces In reality to another kind. First, it may be

discovered that two expressions which apparently represent different entities or different kinds of entities refer in truth to the very same entity or kind of entity. In most instances, one of the two expressions will then be an abbreviation of the other. Second, it may be discovered that a certain informative identity statement is true. In this case, either a description describes the same entity or kind of entity for which there is also a label, or two different descriptions describe the very same entity or kind of entity.

On the second level there are comments about the status and nature of a selected group of categories. Here the main topics are indicated by the five main parts of this book. The first part consists of some introductory remarks about the so-called principle of acquaintance. The second part deals with numbers and quantifiers in general. In I he third part, the discussion turns to properties and classes. The fourth part is concerned with individuals and structures. The fifth part contains a summary of the most important results and a list of categories.

A discussion of the nature of ontological reduction has to be illustrated by examples. Numbers (and quantifiers in general), properties, classes, individuals, and structures are the five categories selected here as examples. In regard to numbers, it is argued (1) that they cannot be reduced to properties or classes, (2) that they form a subcategory of their own, and (3) that they belong to the main category of quantifiers. In regard to properties, the main contentions are (1) that there are no complex properties-that is, no properties represented by complex propositional forms-and (2) that there are properties which do not determine classes. Classes, I shall affirm, need not be determined by properties. The fourth section consists of Essays about four particular problems which arise because there are structures and, in particular, spatio-temporal structures.

On the third and last level of inquiry, an attempt is made to formulate a complete list of the main categories. But while the problem of ontological reduction is rather thoroughly discussed, and while there is also a fair amount of talk about

particular categories, discussion of the hierarchy of categories is admittedly rather sketchy. Nevertheless, a glimpse at the whole system of ontology seemed to me better than no glimpse at all.

Thus, with the three levels of inquiry in mind, you may think of this book in rather old-fashioned terms, as "A discussion of ontological reduction, with special reference to the status of selected categories and culminating in the outline of a list of categories"." (from the Preface)

4. ———. 1974. *Meinong*. London: Routledge & Kegan Paul.

Contents: Preface IX-X; I. Individuals and Properties 1; II. Ideal and Real Relations 21; III. Ideas and Their Intentions 48; IV. Objects of Higher Order 57; V. Assumptions and Objectives 78; VI. Being and *Aussersein* 106; VII. Empirical Knowledge: Perception and Introspection 121; VIII. Relational Knowledge: The Theory of Entities 156; IX. The Apprehension of Objects 182; X. Modalities 199; Appendix I. Meinong's Ontology (by Meinong) 224; Appendix II. Meinong's Life and Work (by Meinong) 230; Notes 237; Index 255.

"This book on Meinong is primarily concerned with his arguments for the positions for which he is famous among some philosophers and infamous among others. But philosophical contentions carry little weight when they are viewed in isolation. Matters are too complex, too difficult, to be settled in an isolated way. Every argument must be evaluated against a background which includes a philosopher's other arguments and some of his basic assumptions or -- if you wish -- prejudices. I therefore discuss Meinong's arguments within the context in which they appear, but with an eye on his earlier positions as well as on his later changes of mind. There are at least two further reasons for adopting this particular approach in Meinong's case.

Findlay, in his classic study of Meinong's philosophy, compares him with G. E. Moore.(1) Although this comparison is apt, there is one respect in which Meinong differs greatly from Moore. Meinong's philosophy develops over the years from a sparse ontology into an ample one. Every new idea is built upon an old

one; new problems arise in the wake of earlier solutions; certain questions are raised time and again, but their answers are more and more refined. In short, there is a definite development, with a definite trend, definite stages, and a distinct final view.

I also wished to impress on the reader how misleading the prevalent view is that Meinong was a spendthrift metaphysician who delighted in multiplying entities continuously and needlessly. If one becomes aware of how Meinong's full ontology develops very slowly over many years from very austere beginnings, how he resists the temptation to solve a problem by admitting a new kind of entity, and how he gives in only after a whole series of arguments for the new kind of entity has accumulated, one will, hopefully, be less inclined in future to think of Meinong as the 'supreme entity multiplier in the history of philosophy'.(2)" (from the Preface).

(1) J. N. Findlay, *Meinong's Theory of Objects and Values*, 2nd ed. (Oxford, 1963), p. 348.

(2) This phrase if from Gilbert Ryle's article in the *Oxford Magazine* 26 October 1933.

5. ———. 1983. *The Categorial Structure of the World*. Bloomington: Indiana University Press.

For the Table of Contents, see the link at the end of the page.

"This book attempts to give a complete and accurate list of the categories of the world. In other words, it tries to bring Aristotle's *Categories* up-to-date.

My investigation into the categorial structure of the world was guided by two main ideas, one systematic, the other, historical in nature. The systematic idea is that most ontological disputes concern, all appearances to the contrary, not the existence of certain entities, but rather their nature. In each one of the chapters which deal with distinct categories, I have therefore discussed the main alternative categorizations of the kind of entity in question. Individual things, for example, have been classified either as particulars (as substances, in the traditional sense) or else as bundles of properties. For properties, too,

there are two important views: they are categorized either as particulars (located in space and/or time) or as universals. Numbers, to give a third example, have been conceived of as multitudes of units, or as properties of properties, or as classes of properties or of classes. In regard to these three kinds of entity, I come to the conclusions that individuals are particulars rather than bundles, that properties are universals rather than particulars, and that numbers are neither multitudes, nor properties, nor classes, but belong to an entirely different category of quantifier.

The historical idea is that until very recently, an Aristotelian ontology of substance and accidence formed the basis of almost all philosophizing. Descartes, for example, is still a member of this tradition. However, in the 17th century there occurred a decisive break with that ontology. The notion of substance was attacked from the left by empiricists (Berkeley) and from the right by rationalists (Leibniz). As a result, a bundle view of individuals was widely accepted, and the Aristotelian distinction between essential and accidental properties was abandoned. But the acceptance of an ontology of bundles and properties raised a series of new questions. How do bundles of properties differ from mere classes? What role do relations play in the formation of bundles? What is the ontological status of relations? What kind of complex entity is a fact? And so on. The 19th century sees the final destruction of the Aristotelian ontology. Not just one, but several new categories appear on the ontological stage: relations, structures, classes, and facts. In this work, I try to take stock of these ontological innovations of the last hundred years or so.

The manuscript for my book was substantially finished several years ago. I mention this fact because it explains why I have not been able to do two things which I would like to do. Firstly, I would like to discuss in greater detail some of the important contributions to ontology which have recently been published. As it was, I could only insert brief references to the works of Armstrong, Butchvarov, Castañeda, Hochberg, and other philosophers. Secondly, I would now devote a separate chapter to negation, in order to emphasize that it is just as much a

fundamental category of the world as, say, the category of property. I think that there are precisely eight categories (not counting existence), namely, individuals, properties, relations, classes, structures, quantifiers, facts, and negation. On second thought, negation really deserves, not just a chapter of its own, but, like existence, a whole separate part; for it is clear that, like existence and unlike the categories, it is not a property. I shall have to write another book called "Negation and Existence"!" (from the Preface).

6. ———. 1984. *Phenomenology and Existentialism: An Introduction*. London: Routledge & Kegan Paul.

   Contents: Preface IX-X; Part I. The background. 1. Descartes: a new conception of the mind 1; 2. Brentano: the thesis of intentionality 29; 3. Kierkegaard: a different conception of man 68; Part Ii. Edmund Husserl: the problem of knowledge 77; 4. The distinction between particulars and universals 79; 5. Husserl's early views on numbers 89; 6. Husserl's distinction between essences and their existences 101; 7. Husserl's distinction between individuals and their aspects 115; 8. The phenomenological method 136; Pat III. Martin Heidegger: the meaning of being 147; 9. Heidegger's project 149, 10. Modes of being 163; 11. The nature of existence 178; Part IV: Jean-Paul Sartre: the question for freedom 199; 12. The structure of the mind 201; 13. The origin of nothingness 226; 14. The pliancy of the past 251; Index 275-278.

   "This book is based on lectures which I have given for the last ten years or so. This explains its style. Some other features, I think, require a little more explanation.

   Different philosophers have quite different conceptions of what philosophy is all about. I am no exception, and my particular conception of philosophy has shaped my treatment of Husserl, Heidegger, and Sartre. In brief, I believe that all important philosophers-whether they know it or not and

   whether they admit it or not-deal with certain traditional problems. There is a, sometimes hidden, continuity to philosophy.

No matter how revolutionary a philosophical movement may at first appear to be, and Phenomenology and Existentialism certainly claimed to be revolutionary, a closer look reveals that the same old problems are merely discussed in a new way. I selected three such problems-the problem of knowledge, the problem of existence, and the problem of freedom-in order to provide some focus to the discussion, and because I believe that they were of major concern to Husserl, Heidegger, and Sartre, respectively.

But philosophical books are written, not only with a definite conception of philosophy in mind, but also from a particular point of philosophical view. My philosophical view is not easily described in contemporary terms. Although I was schooled in what is now called the 'analytic' tradition, I was also taught to appreciate Plato and Aristotle, Aquinas and Scotus, Descartes and Berkeley. I hope to show with this book that one so schooled can appreciate Heidegger and Sartre as well. It is surely silly to assume that only an Existentialist, say, can understand another Existentialist; as silly, I might add, as to believe that all Existentialists talk nonsense.

Finally, there is the fact that I argue, rather vehemently at times, for my own philosophical views. This will undoubtedly offend those who believe that an introductory text should present an unbiased picture. In defense of my polemical style, I can only plead that I find it very difficult to develop the dialectic of a particular problem -- the arguments and counter-arguments, the choices and limits -- without taking a definite stand myself. I assure the reader that I sound much more dogmatic than I am.

And I invite him to develop the arguments further than I have done, refuting my contentions in the process. This is the very stuff of which philosophy is made.

It goes without saying that Husserl, Heidegger, and Sartre have thought and written about things other than knowledge, existence and freedom. Just as it is obvious that there are other Phenomenologists and Existentialists. After all, this is merely an introduction to, not a survey of, Phenomenology and

Existentialism. My main criticism of most of the introductions and anthologies in this field is that they contain bits and pieces from numerous sources from Dostojewski to Marcel, without ever following up on any one topic, with the result that the student cannot possibly appreciate the complexity of the issues, or be impressed by the manner in which philosophical problems grow out of each other." (from the Preface)

7. ———. 1990. *The Fourth Way: A Theory of Knowledge*. Bloomington: Indiana University Press.

   Reprinted with an Introduction by Erwin Tegtmeier: *Grossmann's Radical Empiricism* (pp. I-IV) in: *Reprint Philosophy: Modern Classics of Analytical Philosophy Series*, Frankfurt, Ontos Verlag, 2006.

   Contents: Preface VII-VIII; One: Knowledge of the External Wold: Perception 1; Two: Knowledge of Our Minds: Introspection 89; Thee: Mathematical Knowledge: Perception Again 127; Bibliography 299; Index 304-311.

   "In his commentary on *Kant's Critique of Pure Reason,* Vaihinger considers the four possible views which result if one combines the epistemological distinction between rationalism and empiricism with the ontological distinction between realism and idealism. He claims that until Kant, rationalism was always connected with realism, empiricism always with idealism. But Kant discovered a new combination: The marriage of rationalism with idealism. And then Vaihinger mentions in parentheses that the fourth possible combination, empiricism with realism, has always been considered to be impossible (see H. Vaihinger, *Kommentar zu Kants Kritik der reinen Vernunft,* vol. I, p. 52). It is this "impossible" view which I shall defend. That is why I called this book "The Fourth Way."

   Empiricism means different things to different people. I have in mind the view that our knowledge of the external world rests entirely on perception, and that knowledge of our own minds is solely based on introspection. I hold that there is no special faculty of the mind, no Platonic "contemplation," no Cartesian "understanding," no Husserlian "eidetic intuition," by means of which we know external objects. My version of empiricism may

be called "radical," for it insists, not only that we know the familiar objects around us by perception, but also that we know numbers and other abstract entities by means of perception. I hold that the truths of arithmetic ultimately rest just as much on perception as the truths of physics.

It is in regard to this contention that my view differs most profoundly from other theories of knowledge. While many contemporary philosophers accept empiricism in regard to the "natural sciences," hardly anyone agrees with me that logic, set theory, and arithmetic are a matter of empirical knowledge. But empiricism cannot stand on one leg. An empiricism that claims exception for logic, set theory, and arithmetic is no empiricism at all. Arithmetic, in particular, is the touchstone for any serious attempt to defend empiricism. I shall therefore have to discuss arithmetic knowledge in great detail.

Realism, too, has many meanings. I mean the view that there are such perceptual objects as apples, that these things consist of smaller things like molecules, and that these in turn consist of even smaller objects like elementary particles (or of whatever else the physicist may discover). None of these things is mental. Nor do they depend for their existence or nature on there being minds. But my realism, too, is of a radical sort, for I also hold that there are sets and numbers, and that these things as well do not depend for their existence or nature on minds. Just as an empiricism in regard to science alone can be no more than a paltry evasion of the rationalist's challenge, so realism only in regard to ordinary perceptual objects can be nothing but a worthless response to the idealist's taunt. The realist's work is only half done after he has refuted Berkeley. That an apple is not a collection of ideas is fairly obvious. "That number is entirely the creature of the mind," however, seems to be an unshakable conviction of even the most realistic philosophers.

But even if we rid ourselves of this idealistic bias, even if we accept numbers and sets as part of the furniture of the world, there remains the formidable task of placing these entities somewhere in the hierarchy of categories. Granted that numbers are nonmental, to what category do they belong'? Are

they sets? Or are they perhaps properties of properties? This task, I believe, has been so futile up to now because the proper category for numbers was simply not a part of standard ontologies. Philosophers have for generations tried in vain to squeeze numbers into one of the familiar and traditional categories. Until very recently, there was very little to choose from: Numbers had to be either individual things or else properties of individual things. For an idealist, they could only be either intuitions or concepts. A third possibility finally appeared with the reluctant acceptance of the category of set. But this acceptance posed a new challenge: How to reconcile the existence of sets with empiricism.

Vaihinger, as I said, claims that Kant discovered a new combination: the compatibility of rationalism with idealism. I do not think highly either of Kant's rationalism or of his idealism. But Kant discovered -- and proudly insisted on -- one crucial truth: arithmetic is necessary and yet synthetic. With this discovery, he challenged all empiricists as well as all rationalists. Empiricists have to explain how arithmetic can possibly be necessary; rationalists, how it can possibly be synthetic. This challenge, I believe, has not been met." (from the Preface)

8. ———. 1992. *The Existence of the World. An Introduction to Ontology*. New York: Routledge.

   Contents: I. The Discovery of the World: Timeless Being 1; II. The Battle Over the World: Universals 14; III. The Structure of the World: The Categories 46; IV. The Substratum of the World: Existence 91; V. The Enigma of the World: Negation 120: Bibliography 134; Index 137-139.

   "*The nature of classification.*

   Ontology asks and tries to answer two related questions. What are the *categories* of the world? And what are the *laws* that govern these categories? In chemistry, for comparison, we search for the chemical elements and the laws of chemistry; in physics, for elementary particles and their laws. Categories are for ontology what these basic building blocks of the universe are for the natural sciences. But ontology is not a science

among sciences. Its scope is vastly larger than that of any science. And its point of view is totally different from that of the sciences. To see how ontology differs from science, we must first of all understand the notion of a category. Our first question therefore is: what is a category?

(...)

The *principle* of the classification of the elements, however, is the same as at Empedocles's time: *Things are distinguished from each other by means of the properties which they have.* Let us call this 'the principle of classification'.

(...)

Someone must have realized that the foundation of all classifications of individual things, namely, the distinction between these things and their properties, is itself a classification. But it is a classification, not of *individual things* - individual amounts of water or earth, or individual bits of gold or iron, or individual whales or carps - but of *entities* in general. It is a classification of *any kind* of existent. It divides up everything there is into two large groups of existents, namely, into individual things, on the one hand, and their properties, on the other. Every 'ordinary' classification rests on this most fundamental classification of things into individuals and their properties. In order to distinguish this classification from all others, we shall speak of a 'categorization'. *Entities,* we shall say, *are categorized.* The kinds of thing which the categorization distinguishes are then called 'categories'. We know that there are at least two categories, that is, two kinds of entity (existent), namely, *individual things* and *properties* of individual things." (pp. 1-3).

9. ———. 2009. *Phenomenological Realism Versus Scientific Realism. Reinhardt Grossmann - David M. Armstrong Metaphysical Correspondence*. Frankfurt: Ontos Verlag.

"We choose the title "Phenomenological Realism vs. Scientific Realism" because these two terms indicate what is common and what is different in their respective metaphysical positions. The realism common to them involves the ontological acknowledgement of concrete as well as of abstract entities such as universals and numbers which are taken as independent of mind. The attributes "phenomenological" and "scientific" which differentiate between Armstrong and Grossmann refer to the way they support their ontological realism. Armstrong uses evidences of the natural sciences, Grossmann evidences of perception and introspection. The epistemological differences explain part of the disputes between Armstrong and Grossmann, e.g., over the simplicity of universals.

We have divided this work into four parts distributed in thirty two letters from 1976 until 1987, and three isolated commentaries on three works from 1984 until 1992. Thus, the structure of the book includes an important stretch of the intellectual development of both philosophers from the preparation of their cardinal works, Armstrong with "Universals and Scientific Realism" (Cambridge University Press, 1978) and Grossmann with "The Categorial Structure of the World" (Indiana University Press, 1983), until the publication of Grossmann's "The Existence of the World: An Introduction to Ontology" (Routledge, 1992) and Armstrong's "A Combinatorial Theory of Possibility" (Cambridge University Press, 1989)." (from the Introduction, p. 9)

10. Twardowski, Kazimierz. 1977. *On the Content and Object of Presentations. A Psychological Investigation*. The Hague: Martinus Nijhoff.

    English translation and introduction (pp. VII-XXXIV) by Reinhardt Grossmann of: *Zur Lehre vom Inhalt und Gegenstand der Vorstellungen* (1894).

    "Twardowski's little book - of which I here offer a translation - is one of the most remarkable works in the history of modern philosophy. It is concise, clear, and - in Findlay's words - "amazingly rich in ideas."(1)

It is therefore a paradigm of what some contemporary philosophers approvingly call "analytic philosophy." But Twardowski's book is also of considerable historical significance. His views reflect Brentano's earlier position and thus shed some light on this stage of Brentano's philosophy. Furthermore, they form a link between this stage, on the one hand, and those two grandiose attempts to propagate rationalism in an age of science, on the other hand, which are known as Meinong's theory of entities and Husserl's phenomenology. Twardowski's views thus point to the future and introduce many of the problems which, through the influence of Meinong, Husserl. Russell, and Moore, have become standard fare in contemporary philosophy. In this introduction, I shall call attention to the close connection between some of Twardowski's main ideas and the corresponding thoughts of these four philosophers." (from the Introduction, p. 1)

A Selection of Papers

1. Grossmann, Reinhardt. 1960. "Acts and Relations in Brentano." *Analysis* no. 21:1-5.
2. ———. 1960. "Conceptualism." *Review of Metaphysics* no. 14:243-254.

   Reprinted in: Edwin B. Allaire [and others], *Essays in Ontology*, The Hague, Martinus Nijhoff, 1963, pp. 40-49.

   "There can be no doubt that one is acquainted in perception with red things rather than redness alone. Nor can there be any doubt that one can name things with which one is acquainted. Each of these two facts forms the commonsensical background for an ontological criterion. According to the first criterion, what exists is what can be presented in perception independently of other things. Call this the *independence-criterion*.(1) According to the second, what exists is what can be named. Call this the *naming-criterion*. (p. 40 of the reprint)

   (...)

   Let us ask, finally, what, if anything, the conceptualist has committed himself to with regard to the "existence" of concepts. It seems that he still has a number of alternatives.

   First. The conceptualist could adopt the naming-criterion. Since concepts are named, they would then be said to exist

along with the referents of "this" and "that."

Second. He could reject the naming-criterion and instead accept the independence-criterion. From the fact that concepts are named, it would then not follow that they exist. But notice that the independence-criterion was originally tailored to perception alone, not to thought. This shows that there is a third possibility.

Third. The conceptualist could introduce a new criterion of existence which replaces the old independence-criterion for perception. According to this new criterion, *what exists is what can be presented either in perception or in thought independently of other things*. To grasp that this is a real alternative, consider that according to many philosophers, although one cannot perceive red (or redness) in isolation, one can so think (of) it. If this be true, then upon the new criterion, concepts exist -- not because they are named, but because they can be thought (of) independently.

In the history of philosophy, conceptualism is closely linked with nominalism. More often than not, conceptualists held that concepts subsist rather than exist. Nor is this surprising. Remember the so-called localization-criterion: what exists is what is localized in space and time. This criterion and the conceptualist doctrine that one can in perception be presented only with a particular *this* are just two sides of the same coin. More precisely, the things that are localized upon the one criterion are often held to be exactly those with which one can be presented upon the other. (Time and space have been called "*Formen der Anschauung*.") This makes it plausible, to say the least, that the conceptualist, however unwittingly, may also be guided by the localization-criterion. If so, he will deny that concepts exist.

Comparing all three, realist, nominalist, and conceptualist, we note these similarities. All three admit that there are two ontological modes, namely, existents and subsistents. All three are forced to make this distinction because they accept one of several criteria, naming, independence, or localization, as the most significant criterion of existence. The conceptualist,

however, stands with the nominalist when it comes to separating existents from subsistents. To one who explicates different ontological uses of "exist" rather than adopting one himself, this is of little consequence. The deepest issue, I submit, is not whether universals are called "properties," or "concepts"; whether, perhaps, they are "parts" of something else; or whether, finally, they should be said to exist rather than merely being called subsistents. What then is this deepest issue? To state it, I avail myself of a metaphor I used a while ago. According to the conceptualist we have,.as it were, two eyes; the eye of perception and the eye of the mind. With the latter we "see" the universal. This fundamental dualism both realist and nominalist reject." (pp. 48-49 of the reprint).

(1) For an excellent analysis of the independence-criterion and its importance for the realism- nominalism issue see Edwin B. Allaire, "Existence, Independence, and Universals," The Philosophical Review, 69,1960, 485-496 and also pp. 3-53 of this book.

3. ———. 1961. "Frege's Ontology." *Philosophical Review* no. 70:23-40.

   Reprinted in: Edwin B. Allaire [and others], *Essays in Ontology*, The Hague, Martinus Nijhoff, 1963, pp. 106-120; reprinted also in: D. E. Klemke (ed.), *Essays on Frege*, Urbana, University of Illinois Press, 1974, pp. 79-98.

   "Frege's system has two rather puzzling parts: (1) he insists on the sense-denotation distinction for names but makes no such distinction for concept words; (2) he describes concepts and concept words as being unsaturated. (1) raises the problem whether concept words either denote or express concepts. This problem has been discussed by W. Marshall Dummett.(a) (2) raises a number of different problems, for it led Frege to introduce so-called value ranges and concept correlates. These problems have been discussed by Peter Geach, R. S. Wells, and Gustav Bergmann.(b) Since both kinds of problems arise from Frege's notion of concept, it is plausible, as Bergmann tries to show, that they have their roots in a hidden nominalism. E. D.

Klemke, however, has recently argued against Bergmann that Frege was clearly not a nominalist.(c)

In this paper I shall first suggest the structural reasons for Frege's insistence on (1) and (2). Then I shall make some comments about the issue whether or not Frege was a nominalist. But of course a complete discussion of Frege's philosophy must not be expected in this paper."

   Reply to Reinhard Kamitz, *A reply to Professor Grossman's "Acts and Relations in Brentano"*, Analysis, 22, 1962, pp. 73-78; followed by: R. Kamitz, *Acts and Relations in Brentano: A Second Reply to Professor Grossmann*, Analysis, 23, 1963, pp. 36-41.

5. ———. 1962. "Sensory Intuition and the Dogma of Localization." *Inquiry* no. 5:238-251.

   Reprinted in: Edwin B. Allaire [and others], *Essays in Ontology*, The Hague, Martinus Nijhoff, 1963, pp. 50-63.

   "Conceptualism, like any other philosophical doctrine of comparable scope, has both ontological and epistemological aspects. Ontologically, however, conceptualism does not differ significantly from certain forms of nominalism.(1) At its root lies an epistemological thesis: All objects of sensory intuition

are localized in space and time.(2) In this paper, I wish to explore some of the consequences of this thesis. (p. 50 of the reprint).

(...)

To sum up. The problem of predication forces the conceptualist to part with the dogma of isolation and the dogma of localization. It forces him to admit that there is at least one way in which one is acquainted with things in connection rather than in isolation. And it forces him also to admit that there is at least one way in which one is acquainted with the localized together with the unlocalized. Being aware of these consequences, the conceptualist could retreat to a simplified form of conceptualism." (p. 61 of the reprint).

(1) I have discussed the ontological ramifications and possibilities of conceptualism elsewhere. See "Conceptualism," The Review of Metaphysics, 14,1960,243-54 and also pp. 40-49 of this book.

(2) I shall distinguish between sensory intuition and presentation as two distinct ways in which one might be acquainted with particular things and universals, respectively.

6. ———. 1963. "Particulars and Time." In *Essays in Ontology*, edited by Allaire, Edwin B., 30-39. The Hague: Martinus Nijhoff.

"Some philosophers agree that there is a connection between particularity and time: Particulars are in time; universals are not. However, they disagree among themselves about the precise nature of this connection. I wish to discuss some of the problems which give rise to their disagreement.

Perceptual objects are *continuants*. Phenomenal objects, e.g. sensa, mental acts, and the like, are *momentary* entities. A certain perceptual object A, being a continuant, may change its color from green to red and hence be green at one time and not green at another. Obviously, this situation cannot be described by the sentence 'A is green and A is not green.' The only satisfactory description introduces time in the form of moments: 'A is green at t1 and A is not green at t2'.(1) If one

starts the philosophical analysis with continuants, one must introduce moments in order to describe a changing thing. Put differently, a philosopher who starts out with continuants, commits himself to *absolute time*. But time is *relational*. It follows that one must start not with perceptual objects (continuants), but rather with phenomenal objects, that is, with momentary things.(2)

This argument for phenomenalism is not sound. The ontological analysis of *things* shows quite conclusively and on its own ground that (logically) proper names must name *particulars*, rather than things,(3) According to this analysis, a perceptual object A, say, a colored disk, consists of a particular a which exemplifies certain universals. The same holds for a so-called phenomenal object, say, a colored spot in a visual field. What we ordinarily call a (perceptual or phenomenal) thing, turns out to be a complex entity, only part of which is named by the proper name 'a'. Irregardless, therefore, of whether or not perceptual and phenomenal objects are continuants, philosophical analysis starts with neither. The argument could therefore not possibly establish that it must start with phenomenal rather than perceptual objects.4 Our criticism shows, though, that we need not consider the distinction between perceptual and phenomenal objects, in order to discuss the connection between particulars and time.

But even though it fails, the argument contains a very important point. It seems to prove conclusively that particulars must be momentary entities, if time is relational rather than absolute. To be momentary means in this connection to be changeless. Hence there is a connection between particularity and *change*: If time is relational, then particulars must be changeless. Yet, a perceptual or phenomenal object may change, even though it consists of nothing else but a particular which exemplifies certain universals. We confront here an apparent inconsistency which ontological analysis must resolve."

(1) Of course, time may be introduced through tenses. But this creates ontological problems of a different sort.

(2) Compare, for example, G. Bergmann: *Meaning and Existence* (Univ. of Wisconsin Press, Madison, 1960), pp. 182-188 and pp. 230-239.

(3) Compare Essays II [*Bare Particulars* by Edwin B. Allaire] and V [*Conceptualism* by R. Grossmann] of this book.

7. ———. 1963. "Common Names." In *Essays in Ontology*, edited by Allaire, Edwin B., 64-75. The Hague: Martinus Nijhoff.

   "The doctrine of common names has a long history. It always finds proponents who think that it is a way out of the classical nominalistic difficulties. I wish to show that this doctrine does not even make sense when considered apart from the nominalism which it supposedly vindicates, and that it could be of no help to the nominalist, even if it made sense. (p. 64)

   (...)

   To sum up. Even if the common name doctrine were acceptable, it could be of no help to a nominalist. For, even if he could explain what it means for a word to name commonly, he cannot explain what there is in or about individual things that collects them under one common name. It is indeed one of the most curious facts in the history of philosophy that a certain type of nominalism should derive from the doctrine of common names. Perhaps the only explanation is that the spurious doctrine of particularized essences and the spurious doctrine of common names tended to reinforce each other." (pp. 74-75).

16. ———. 1984. "Non-Existent Objects Vs. Definite Descriptions." *Australasian Journal of Philosophy* no. 62:363-377.

    "Some years ago, I published an article about Meinong's theory of objects. (1) I listed there four main theses of Meinong's view:

    (1) The golden mountain (and other nonexistents) has no being at all.

    (2) Nevertheless, it is a constituent of the fact that the golden mountain does not exist.

    (3) Furthermore, it has such ordinary properties as being made from gold.

    (4) Existence is not a constituent of any object.

And I argued in that paper that only thesis (1) is true. In particular, I insisted that (3), which I consider to be the most characteristic feature of Meinong's view, is false.

Since then, there have been quite a few discussions of Meinong's view. I would like, in response to some of these works, to reiterate my earlier criticism of Meinong. My purpose is threefold. Firstly, I would like to state once more my own view, which is a version of Russell's theory of definite descriptions, as clearly as possible. Secondly, I shall defend my past contention that the golden mountain is not golden against some recent objections. And thirdly and most importantly, I want to describe the dialectic of the philosophical problem as I perceive it. It seems to me to be an exasperating shortcoming of the discussion that most participants do not clearly state the basic options and their reasons for preferring some to others."

(1) 'Meinong's Doctrine of the *Aussersein of* the Pure Object', *Noüs,* 8 (1974, pp. 67-81. See also my *Meinong* (Routledge and Kegan Paul, London, 1974).

17. ———. 1995. "Frege's Fundamental Philosophical Mistakes." In *Logik Und Mathematik. Frege-Kolloquium Jena 1993*, edited by Ingolf, Max and Stelzner, Werner, 226-231. Berlin: de Gruyter.

    "It is one of the most surprising features of Frege's philosophy that he, who correctly analyzed the structures of quantified states of affairs, insisted on treating definite description expressions ('the birthplace of Mozart') like names ('Salzburg') and names like definite description expressions.' I shall argue that Frege's original mistake leads to a string of further mistakes. It leads him to hold that names, like definite description expressions, have both a sense and a reference and, eventually, to the view that sentences name truth-values. In short, it results in his much admired sense-reference theory of meaning." (p. 226).

18. ———. 1995. "Thoughts, Objectives and States of Affairs." *Grazer Philosophische Studien* no. 49:163-169.

"The notion of state of affairs was introduced as the complexly signifiable in the Late Scholasticism and rediscovered by Logicians like Bolzano and Frege. While Bolzano and Frege were primarily interested in the nature of objective truths students of Brentano, among others Meinong, Twardowski and Husserl, developed similar concepts starting out with an interest in the nature of mental acts and judgement. Both Frege's and Meinong's conceptions face similar problems concerning complex referents which are diagnosed to stem from confusions of complexes of properties with complex properties."

    "Seldom has a modern philosopher become as famous for a view which he does not hold as Alexius Meinong. One generally attributes to him the belief that there are, not just such ordinary things as mountains and relations, but even such things as the golden mountain and the round square. He is therefore often viewed as a spendthrift ontologist who delighted in multiplying entities continuously and needlessly. But this conception, I shall try to show, is mistaken. Anyone who has studied Meinong's philosophy carefully will come to the conclusion that he is not the 'supreme entity-multiplier in the history of philosophy' as Gilbert Ryle claims.(1)

But even though Meinong never embraced the rather extreme view that there are, in addition to existing things in space and time and subsisting things (ideal things) outside of space and time, also such things as the golden mountain, and even such contradictory things as the round square, he nevertheless insisted on another ontological principle not any less mistaken than what I just called the 'extreme' view. It is this insistence, and not his ontological inventory, which I consider to be Meinong's main mistake. I shall, therefore, first defend Meinong against the kind of accusation implied in Ryle's description of Meinong. And then I shall, secondly, show where Meinong really went wrong in his ontology." (p. 477)

The Ontological Realism of Panayot Butchvarov

Annotated bibliography

Books

1. Butchvarov, Panayot. 1966. *Resemblance and Identity. An Examination of the Problem of Universals*. Bloomington: Indiana University Press.

   Contents: Preface IX-XIV; Introduction 3; 1. The nominalist theory 16, 2. The identity and the resemblance theories 56; 3. The relation of resemblance 101; 4. Generic identity 135; Conclusion 173; Bibliography 199; Index 205.

   "The first task of this essay, therefore, is the development of a distinctive and philosophically useful notion of universal, and of a corresponding statement of the problem of universals as a separate philosophical issue. Its second task is the solution of the so-stated problem of universals. Roughly, I shall identify the notion of universal with that of universal quality, in a very wide sense of the word "quality" to be explained in section 1. And I shall offer an explanation of the notion of universal quality that does not depend on the employment of the technical philosophical terms "universal," "particular," or "abstract." I shall identify the problem of universals with the question whether there are universal qualities, i.e., whether the qualities of individual things are universal or particular, or, as I shall actually state it without the use of the terms "universal" and "particular," whether certain qualities of individual things should be described as being one and the same quality or

distinct qualities related by a relation of resemblance. Other questions concerning universals, I believe, are either consequences or under modifications of this primary problem, or else independent philosophical issues having no special relation to the puzzles concerning universals. That this is so will become evident, I hope, in the course of our inquiry, especially in sections 1, 2, 5, 13, 17, and 18. But I shall not engage in the historical and exegetic investigations necessary for an actual proof of this claim. My statement of the problem of universals, in particular the identification of the notion of universal with that of universal quality, accords well with important traditional conceptions, such as "the universal is common, since that is called universal which is such as to belong to more than one thing" (Aristotle), and "the universal is that which is in many and of many" (Albert the Great). But does it not fail to take account of the second part of the equally important traditional question "whether genera and species really exist or are bare notions only; and if they exist whether they are corporeal things, or incorporeal and rather separated, or whether they exist in things perceived by the senses and in relation to them," (Porphyry)? For it seems to exclude from consideration one of the major theories of universals: that "genera and species exist not in sensibles but in separation from sensibles," and that universals may exist even if they have no instances. Now if this theory amounts to the claim that qualities, whether particular or universal, need not be qualities of individual things, that the notions of genus and species can be explained independently of those of instantiation or participation, then indeed we need not consider it, since, in virtue of the very notions of quality, genus, and species, it is obviously false. But the theory need not be interpreted so crudely as to become obviously false. It can be interpreted as claiming that there is an enormous, categorial difference between individual things and universal qualities and that because of this difference the senses in which universal qualities can be said to exist and to be in space and time, and the senses in which individual things can be said to exist and to be in space and time are so different that one can assert the existence of a quality on the ground that it can have instances,

even if in fact it has not. I shall consider this claim at the end of the book. But the logically prior questions are, "What is a universal quality?" and "Are there universal qualities?" It is mainly to these questions that I shall address myself in this essay. In many ways the problem of universals is the paradigm of a philosophical problem. It bears virtually no resemblance to any issue of experimental science. It is supremely general, in the sense that it concerns a certain fact about all qualities, in any actual or possible world, in complete abstraction from circumstances and contexts. And it is neither overtly nor disguisedly a problem about philosophy, one which is of interest to philosophers only because of their self-consciousness about the status and possibility of their discipline. Perhaps this is why writers on the problem of universals are especially tempted to connect their inquiries with considerations about philosophical method. I have succumbed to this temptation, mainly in Chapter Three. In content, if not in style, this essay is intended to be metaphysical. Part of its purpose is to demonstrate, in the context of a specific philosophical topic, that at least one branch of philosophy is a legitimate cognitive discipline that has as its subject matter, not certain features of language or of mathematics, but the essential and most general characteristics of the world."

2. ———. 1970. *The Concept of Knowledge*. Evanston: Northwestern University Press.

   Contents: Part One: Primary knowledge 3; Part Two: The objects of a priori knowledge 99; Part Three: Primary Perceptual knowledge 185; Part Four: Derivative knowledge 267; Index 321-325.

   "Part One of this book attempts an account of the general concept of knowledge, especially as it is employed in what I shall call primary epistemic judgments, that is, judgments of the form "A knows that p" which would not typically be in need of justification by appeal to other epistemic judgments. (Epistemic judgments that are in need of such justification I shall call derivative, and I shall make a corresponding distinction between primary and derivative knowledge.) We

shall find that this account leads to, indeed demands and at the same time illuminates, the division of all knowledge into a priori and a posteriori. But unless then a detailed elucidation of this division is provided, the general account of the concept of knowledge would remain skeletal. There are two questions in particular that such an elucidation must answer. First, what are the objects of a priori knowledge? Second, what is the nature of primary a posteriori knowledge? Our account of the concept of knowledge, like most such accounts, requires that the object of knowledge be a certain truth or fact. But what, if anything, could be an a priori (or necessary) truth or fact? Our account, again in common with most, requires the distinction between primary and derivative knowledge. But can this distinction be made good with respect to our sense-perceptual knowledge of the "external" world of bodies, which is the paradigm and most extensive segment of a posteriori knowledge? That the answers to these questions are not at all settled should be obvious. Yet, unless it includes such answers, an account of the general concept of knowledge cannot be accepted as satisfactory. Part Two of this book will attempt to provide an answer to the first question, and Part Three an answer to the second.

The consideration of a posteriori knowledge in Part Three raises with particular urgency the question of the possibility and nature of derivative knowledge. This is not surprising. That question concerns chiefly derivative a posteriori knowledge, the nature of derivative a priori knowledge being largely the concern of formal logic and its possibility generally unquestioned. The crucial issue regarding derivative a posteriori knowledge is the legitimacy of nondemonstrative inference. In Part Four we return to our inquiry into the general concept of knowledge, but this time with special attention to the issue of nondemonstrative inference and to the nature of derivative knowledge in general, and provide further reasons in support of the chief thesis of Part One.

I shall not, however, discuss the usual philosophical problems about the validity of certain particular kinds of derivative knowledge (e.g., of the future, of bodies, of other minds). Each of these requires careful, detailed treatment in its own right;

nothing is gained by sweeping proclamations or refutations of skepticism. And since these problems constitute the familiar subject matter of the theory of knowledge, I offer here only an introduction to that branch of philosophy and not a theory of knowledge as such. Indeed, as is well known, the sort of theory of knowledge one proposes, and most of its tenets, are largely determined by the account one offers of the fundamental epistemic concepts. It is important, however, that such an account be given first and that it be uninfluenced by one's epistemological convictions. For, true or false, these convictions have philosophical value only insofar as they are justified, and their justification cannot be attempted without an account of the key concepts involved. Thus the reader may come to think that our inquiry leads to skepticism. In this, as I shall explain, he would be mistaken. But even if he were not, I would regard such a consequence as acceptable, as long as the rejection of skepticism is not itself grounded in investigations such as ours. Our respect for common sense must not be confused with the possession of a philosophical answer to skepticism. In philosophy, as in any other purely theoretical discipline, it is better to be wrong as the result of inquiry and argument than to be right as the result of mere conviction. The layman who takes the existence of an external world for granted may be right, and the philosophical skeptic whose inquiries lead him to deny the existence of an external world may be wrong. But the skeptic is the philosopher, and the layman is not." pp. 4-5

3. ———. 1979. *Being Qua Being. A Theory of Identity, Existence, and Predication*. Bloomington: Indiana University Press.

   Contents: Acknowledgments IX; Introduction 1; 1. The apparent distinctness of Identicals 9; 2. Objects and entities 39; 3. Indiscernibility 64; 4. Existence 82; 5. essence 122; 6. Substances 154; 7. qualities 184; 8. Accidental connections 212; Appendix A. Relations 239; Appendix B. Idealism 248; Notes 256; Index 267.

   "The inquiry into being qua being has been identified with metaphysics. But it would be better to use the term "metaphysics" more broadly, namely, for the branch of philosophy that has as its subject matter the nature of the

world, or of reality, rather than the nature of our knowledge, or of our language, or of our sciences about the world. We may then distinguish several levels of metaphysical inquiry. On the least fundamental level metaphysics is concerned with the most general description of the actual world, with the most general kinds of things there are and with the way they fit together. It asks such questions as whether God exists, whether there are both minds and bodies or only minds or only bodies, and if there are both minds and bodies, how they are related. On this level it is closely connected with epistemology, since the main philosophical difficulties such questions pose for us are epistemological in character.

On a more fundamental level, presupposed by the first, metaphysics inquires into the nature of all possible, or at least all conceivable, comprehensible worlds, and thus only indirectly into the nature of the actual world. Can there be a world that consists only of individuals and not also of properties and relations? Or a world that consists only of properties and relations? Can there be nonidentical but indiscernible things? Questions related to those on the previous level can now be asked in complete independence from the usual epistemological considerations. Can there be a world unless there is God? Can there be a world without bodies? Without minds? On this level metaphysics is closely connected with logic. (Immediately following his introduction of the notion of a science of being qua being Aristotle offers a defense of the laws of non-contradiction and excluded middle.) But this connection is no more limited to formal logic than the notion of necessary truth is limited to the truths of forma logic. The criterion of possibility on which it would rely can hardly be mere forma consistency; it must be conceivability or comprehensibility (not of propositions, but of what propositions purport to describe), for, whether we like it or not, we have no other general and ultimate criterion of possibility.

This is why, on this level, metaphysics is also connected with phenomenology, i.e., with the philosophical description of the most genera character of the objects of consciousness qua objects of consciousness.

On the third and most fundamental level metaphysics is concerned with the concepts and principles on the basis of which the questions belonging to the other two levels, i.e., the questions about what things there are or at least there can be, must be answered. Instead of there questions, it asks, what is it for something to be in a world, or for something to be a world? It is on this level, I suggest, that metaphysics is best described as the inquiry into being qua being, or, we might also say, as protometaphysics. Any conception of a world presupposes the conception of what it is for something to exist in that world. Any conception of a thing presupposes the conception of what it is for it to be the subject of predication, both accidental and essential. Any conception of a thing presupposes the conception of what it is for it to be identifiable, not in the sense of being merely singled out but also in the sense of being singled out again or in a different way, of being recognized, of being the subject of a true informative identity judgment.

It follows that the concepts of existence, identity, essential predication, and accidental predication cannot be understood as standing for constituents of the world, presumably for certain properties or relations. They are the concepts in terms of which we must understand what it is for something to be in the world, what it is for something to have a property or be related to another thing, and what it is for something to be a property or a relation. Yet they apply to any possible world; indeed nothing would be a world were it not for their applicability to it. We may call such concepts, which apply without standing for anything, transcendental. The inquiry into being qua being, or protometaphysics, may then be called a transcendental inquiry.

Now the central thesis of this book is that the concepts of existence, identity, accidental predication, and essential predication are intimately related, and moreover that the concept of identity is basic and the other three are to be understood in terms of it. I shall argue that the four puzzles with which we began admit of a common solution, the key to which is to be found in a careful study of the second puzzle, that regarding identity. It is a solution based on a distinction

between what I shall call objects and entities. A similar, but not the same, distinction has often been made, most notably by Meinong but also by recent possible-worlds semanticists, in treatments of the first puzzle, that regarding existence. But there it rests on the proposition that there are things of which it is true that there are no such things, a proposition that, I suggest, cannot be made coherent, let alone plausible, except on the basis of considerations external to the topic of existence. A similar, but again not the same, distinction has also been made, e.g., by Carnap and Sellars, in treatments of an aspect of the second puzzle, namely, the seeming failure of the principle of the Indiscernibility of identicals in intentional and modal contexts; I have in mind the distinction between individuals and individual concepts. But if an individual concept is indeed a concept, or at all like a concept, then it is not the object of the propositional attitude, or the subject of the modal property, with respect to which the principle seems to fail, and therefore its relevance is obscure. If it is not really a concept, then how does it differ from the individual with which it is associated? Again, I believe that these questions can be answered only on the basis of considerations both far more general and much deeper than the seeming discernibility of identicals in intentional and modal contexts." pp. 3-5 (notes omitted).

4. ———. 1998. *Skepticism About the External World*. New York: Oxford University Press.

   Contents: Introduction 3; 1. Direct realism 12; 2. The Adverbial theory 35; 3. The skeptic's argument 56; 4. A first answer to the skeptic 89; 5. Our concept of reality 111; 6. The untruth and the truth of skepticism 133; Notes 159; Index 179.

   "We are now ready to attempt another answer to the skeptic, one based on the preceding considerations regarding the concept of reality. Can what I have called the particular (nonmodal epistemic) question, namely, Do we know or at least have evidence, in some particular perceptual situation, that what we perceive is a real material object? be given a nonskeptical answer, just as in chapter 4 I gave a non skeptical answer to the general (non-modal epistemic) question, namely, Do we know or at least have evidence that material objects

exist? If it can, then we would also have a second nonskeptical answer to the general question, since a nonskeptical answer to the particular question entails a nonskeptical answer to the general question, though not vice versa. Thus my argument in chapter 4 in favor of the latter would receive welcome supplementation. But, as we shall see, we would still need that argument at a crucial point in our search in this chapter for a complete nonskeptical answer to the particular question. The fact is that both answers are needed. There is no circularity here, since the argument in chapter 4 is independent of the argument to be offered in this chapter, It's just that the converse is not quite the case.

Clearly. the question whether a certain perceptual object exists, is real, cannot be answered unless an account of the concept of existence, reality, is offered, even though this fact has been generally ignored by recent Anglo-American philosophers of perception (in striking contrast with continental philosophers). I have already said why Russell's account in terms of the satisfaction of a propositional function is unacceptable; it presupposes a more fundamental concept of existence, which would allow us to decide what to count as admissible arguments of the function and what not to so count. And the familiar proposal that the reality of an object consists in its fitting in the spatiotemporal causal system of the world is conceptually circular; it presupposes the concept of reality, for of course the system in question must be a system of real objects, and the causal relations in it must also be real, rather than imaginary, if the "fitting in" is to be even relevant. For similar reasons. also conceptually circular is the Kantian-phenomenalist account, as I argued in chapter 5.

The failures of those accounts should not be surprising if the existence, the reality, of an object cannot be thought of as one of its properties, relational or nonrelational. It certainly is not observable, and we would he indulging in mere fantasy if we suppose that it is somehow hidden in or behind the object that exists. I have argued that we should think of existence as the indefinite identifiability of the object to which it is attributed, in the sense that there is an indefinite number of objects with each

of which it is identical. But their identity is not something in reality. Rather it is imposed on them by our decisions to apply the concept of identity, The same can be said about the concept of existence, reality, since it is to be understood in terms of the concept of identity. Both are transcendental concepts." pp. 133-134

Essays

1. ———. 1974. "The Limits of Ontological Analysis." In *The Ontological Turn. Studies in the Philosophy of Gustav Bergmann*, edited by Gram, Moltke and Klemke, Elmer, 3-37. Iowa City: University of Iowa Press.

2. ———. 1977. "Identity." *Midwest Studies in Philosophy* no. 2:70-89.

   "A novel account is offered of the nature of informative identity statements. Special attention is accorded to the intimate connection between the concept of identity and the concept of existence, and to their fundamental role in any intelligible conceptual framework."

   Reprinted in: Peter A. French, Theodore E. Uehling, Jr., Howard K. Wettstein (eds.) - *Contemporary perspectives in the philosophy of language* - Minneapolis, University of Minnesota Press, 1979

3. ———. 1981. "The Ontology of Philosophical Analysis." *Noûs* no. 15:3-14.

   "The most striking fact about recent analytic philosophy has been its return to metaphysics. But it is characteristic of most recent analytic ontologies that they do not face the ontological issues directly, but rather consist in the search for definitions that would capture ordinary usage or in paraphrasing ordinary statements supposed to be ontologically problematic. Gustav Bergmann, whose recent work is reviewed here, is an exception. His recent ontology constitutes a genuine and unabashed turn to the things themselves. However, it involves excesses which seem due to insufficient attention to the peculiarities of the ontologically crucial concept of identity."

4. ———. 1986. "Our Robust Sense of Reality." *Grazer Philosophische Studien* no. 25/26:403-421.

   "Anti-Meinongian philosophers, such as Russell, do not explain what they mean by existence when they deny that there are nonexistent objects - they just sense robustly. I argue that any plausible explanation of what they mean tends to undermine their view and to support the Meinongian view. But why are they so strongly convinced that they are right? I argue that the reason is to be found in the special character of the concept of existence, which has been insufficiently examined by anti-Meinongian as well as by Meinongian philosophers."

5. ———. 1988. "Russell's Views on Reality." *Grazer Philosophische Studien* no. 32:165-167.

   "Russell's account of existence as satisfaction of a propositional function presupposes a more fundamental notion of existence, which we would employ in deciding what to allow as arguments satisfying a function, a notion he never elucidates. Jan Dejnožka has distinguished three ways Russell used the term "exists," one being the phenomenalist's, in which it refers to correlations of sense-data. I argue that this phenomenalist notion cannot be the one Russell needs, since he explicitly held that existence be understood broadly, so that, e.g., the nonexistence of God would not follow by definition."

The Conceptual Realism of Nino Cocchiarella

Introduction

I wish to thank Professor Cocchiarella for helping me to complete this bibliography.

"Research Profile: Cocchiarella proved the first completeness theorems in tense logic and second-order modal logic. He was the first to develop several second-order logics with nominalized predicates as abstract singular terms and then to use those systems in a consistent logical reconstruction of both Frege's and Russell's early logics and in the application of those reconstructions to the semantic analysis of natural language. This work also led to Cocchiarella's development of formal theories of predication and comparative formal ontology, including especially logical reconstructions of nominalism, conceptualism, logical realism, and the logic of natural kinds. Cocchiarella also showed how logical atomism is compatible with logical necessity as a modality, and that it is the only ontology in which logical necessity, as opposed to other kinds of modalities, makes sense. Cocchiarella's own preferred ontological framework is conceptual realism, which he has been formally developing for many years, and which contains a logic of both actualism and possibilism in terms of a distinction between concepts that entail concrete existence and those that do not. It also contains a logic of classes as many as plural objects, which is the basis of Cocchiarella's semantics for plurals and mass nouns in natural language, and in which the Leonard-Goodman calculus of individuals (and therefore Leśniewski's mereology as well) is reducible. Cocchiarella has also shown that Leśniewski's ontology,

which is also called a logic of names, is reducible to his theory of reference in conceptual realism, and that the medieval supposition theories of Ockham, Buridan, and other medieval logicians can be logically reconstructed in terms of this theory of reference. Cocchiarella is currently continuing his work on different subsystems of conceptual realism, including in particular a logic of events as truth-makers.

Teaching: Cocchiarella has taught introductory, intermediate, and advanced courses in logic, semantics, set theory and Montague Grammar, as well as seminars on some of the most recent areas of research in logic. He has placed an emphasis in his teaching on the logical analysis of natural language and the ontological interpretations of both scientific and mathematical language.

Vision Statement: Cocchiarella sees logic as a powerful tool for the analysis of our scientific theories and the structures that underlie natural language and our commonsense understanding of the world. The study of logical categories in particular provides an important way to study the semantic and ontological categories underlying our scientific and commonsense world views." (pp. 52-53)

From: Dov M. Gabbay, John Woods (eds.), *The International Directory of Logicians. Who's Who in Logic*, London: College Publications 2009.

Formal ontology

"Formal ontology is the result of combining the intuitive, informal method of classical ontology with the formal, mathematical method of modern symbolic logic, and ultimately identifying them as different aspects of one and the same science. That is, where the method of ontology is the intuitive study of the fundamental properties. modes, and aspects of being, or of entities in general, and the method of modern symbolic logic is the rigorous construction of formal, axiomatic systems, formal ontology, the result of combining these two methods, is the systematic, formal, axiomatic development of the logic of all forms and modes of being. As such, formal ontology is a science prior to all others in which particular forms, modes, or kinds of being are studied.

Logic can be distinguished from formal ontology, but only in the sense of logic as an uninterpreted calculus, Le. as the method of constructing abstract formal systems subject to varying interpretations over varying domains. A formal system in which logical (or syncategorematic) constants can be distinguished from non-logical (or categorematic) constants and in which the axioms and rules are assumed to be logically valid is not an uninterpreted calculus, however, but a logistic system in which logic is a language with content in its own right. The defining characteristic of a logistic system is that it propounds a theory of logical form. which comprises both a pure logical grammar, i.e. a system of categories and rules for generating meaningful expressions, and a system of logical axioms and rules that determine the deductive relations between different sets of expressions of that grammar. The purely formal or non-descriptive content of the existence of any and all physically real individuals or of the natural properties and relations that such individuals might have in nature, is not independent of the different modes of being of such entities, and in fact presupposes such modes in its very articulation."

Edmund Husserl was among the first to characterize a logistic system in this way, and it was he who also first introduced the notion of a formal ontology. For Husserl, logic has both an apophantic (assertional) aspect, which he called formal apophantics (and which amounts to a theory of logical form as characterized above), and an ontological aspect, which he called formal ontology. The switch from a formal-apophantic attitude to an ontological one is achieved primarily through a process of nominalization, and the underlying unity of the two aspects is given through a ‘Law of Denominative Equivalence’, according to which the well-formed expressions of any given category may be transformed into corresponding nominal forms. It is in this way, for example, that propositional forms and their predicative components (as generated in the theory of logical forms) are transformed into nominal forms that stand for states of affairs and properties and relations, respectively. The ‘categorial objectivities’ or ‘correlates’ that originate from such ‘denominative reductions’ (or nominalizations) of the pure forms of apophantic logic are then claimed to make up the fundamental conceptual material of formal ontology (cf. *Logical Investigations*, Volume I,

§§67—8, *Ideas*, §119, and *Formal and Transcendental Logic*, Chapter 2, §25). The important connection of ontology with a logistic system is that the logico-grammatical distinctions made in the latter are based ultimately on a distinction between different modes of being, even if that distinction is initially described in terms of different modes of significance. More is required by way of comprehensive grasp, however, before a logistic system can be taken as a system of logic or a formal ontology in its fullest sense. In particular, such a logistic system must be rich enough to contain, when suitable non-logical constants, axioms, and meaning postulates (regarding such constants) are added to it, every scientific theory and the logical analysis of every meaningful declarative sentence of any natural language. In that case such a logistic system can be taken as a lingua philosophica, or what Leibniz also called a characteristica universalis, and as such it is also none other than a comprehensive system of formal ontology.

(...)

Beginning with Aristotle, the standard assumption in (pre-formal) ontology has been that being is not a genus, i.e. that being is multivalent, and that the principal method of ontology is categorial analysis. This raises the problem of how the different categories or modes of being fit together, and of whether one of the senses or modes of being is preeminent and the others somehow dependent on that sense or mode of being. The differential categorial analyses that have been pro-posed as a resolution of this problem have all turned in one way or another on a theory of predication, i.e. on how the different categories fit together in the nexus of predication, and they have differed from one another primarily on whether the analysis of the fundamental forms of predication is to be directed upon the structure of reality or the structure of thought. In formal ontology, the resolution of this problem involves the construction of a formal theory of predication. Aristotle's categorial analysis, for example, is directed upon the structure of reality and not upon the structure of thought, and the pre-eminent mode of being is that of concrete individual things (or primary substances). Predication, moreover, is explained in terms of two ontological configurations that together characterize the essence-accident distinction of Aristotle's ontology, viz. the relation between an individual and its species or genera on

the one hand, and the inherence of a universal in an individual on the other. Aristotle's moderate realism regarding species, genera, and universals is a form of natural realism and not of logical realism, and a formal theory of predication constructed as an Aristotelian formal ontology must respect that distinction as well as give an adequate representation of the two ontological con-figurations underlying the Aristotelian analysis of predication. In particular, such a theory must contain a logic of natural kinds and must impose the constraint of moderate realism that every natural property or relation is instantiated (i.e. that every natural property or relation exists only in rebus). This constraint leads to Aristotle's problem of the fixity of species (according to which members of a species cannot come to be except from earlier members of that species, and that therefore there can be no evolution of new species); but, given the modal category of natural necessity and possibility as part of a revised Aristotelian formal ontology of modal natural realism, this problem can be resolved by requiring of every natural property or relation not that it actually be instantiated (at any given time) but only that such an instantiation be within the realm of natural possibility. Such a formal ontology, needless to say, will contain a modal logic for natural necessity and possibility, as well as a logic of natural kinds that is to be described in terms of that modal logic. (Cf. Cocchiarella 1976.) Plato's ontology is also directed upon the structure of reality, but the pre-eminent mode of being in this framework is not that of concrete or sensible objects but of the Ideas. This leads to the problem of μέθεξις, or of how and in what sense concrete objects participate in Ideas, and also to the problem of χορισμός, or of how and in what sense Ideas are 'things' or abstract individuals separate from the concrete individuals that participate in them. A Platonist theory of predication in contemporary formal ontology is the basis of logical realism (where it is assumed that a property or relation exists corresponding to each well-formed predicate expression of logical grammar, regardless of whether or not it is even logically possible that such a property or relation has an instance). When applied as a foundation for mathematics (as was Plato's own original intent), logical realism is also called ontological logicism. The best-known form of logical realism today is Bertrand Russell's theory of logical types, which Russell developed as a way to avoid his famous paradox of predication (upon which his paradox of

membership is based), a paradox not un-related to Plato's problem of χορισμός. Whether and to what extent Russell's theory of logical types can satisfactorily resolve either of Plato's problems and be the basis of an adequate realist formal ontology is an issue that belongs to what we have called comparative formal ontology. (pp. 640-643)

(...)

Comparative formal ontology, as our remarks have indicated throughout, is the proper domain of many issues and disputes in metaphysics, epistemology, and the methodology of the deductive sciences. Just as the construction of a particular formal ontology lends clarity and precision to our informal categorial analyses and serves as a guide to our intuitions, so too comparative formal ontology can be developed so as to provide clear and precise criteria by which to judge the adequacy of a particular system of formal ontology and by which we might be guided in our comparison and evaluation of different proposals for such systems. It is only by constructing and comparing different formal ontologies that we can make a rational decision about which such system we should ourselves ultimately adopt, and that is a decision that can be made only in comparative formal ontology. (p. 647)

Mathematical logic as formal ontology

"Gödel has remarked that mathematical logic "has two quite different aspects. On the one hand, it is a section of Mathematics treating of classes, relations, combinations of symbols, etc., instead of numbers, functions, geometric figures, etc. On the other hand, it is a science prior to all others, which contains the ideas and principles underlying all sciences" (1) In the former case, mathematical logic is principally, though not only, a *calculus ratiocinator*. Under that aspect, beyond consistency, no special heed need be paid a formal system regarding the philosophical significance of its grammatical forms and the viability of the primitive concepts and assumptions expressed by means of these forms. In the latter case, however, it is quite otherwise. As a science prior to all others, Gödel's description

of mathematical logic is comparable to Aristotle's description of metaphysics. Only, as a science which is prior to all others, metaphysics, according to Aristotle, is therefore the science of the "modes" or "categories of being". Where the particular, specialized sciences, including mathematics, are concerned with but their own special "modes of being", metaphysics and now mathematical logic under its second aspect — or what we might instead call formal ontology — is concerned with the study and development of alternative formalizations regarding the systematic co-ordination of all the "modes" or "categories of being" under the most general laws. Usually, and perhaps most appropriately since this is where ontological commitment comes in, each "mode of being" within a particular formal ontology is represented by a type of bindable variable whose syntactical role is intended to reflect in some philosophically coherent way the ontological role of that "mode of being". Under this second aspect, mathematical logic, or formal ontology, is concerned with the adequacy of formal systems as alternative formulations of the deepest structural maps of reality.(2)

Viewed in this way, each feature of a proposed formal system is to be evaluated in terms of its purported philosophical significance, how well, for example, it functions as a proposed metaphysical map of reality. Different metaphysical schools, of course, will be interested in different ways of understanding a formal system as a map of reality. Conceptualists, for example, would view the grammar of a formal system together with its logistic behaviour as a proposed formal map of the structuring powers of human cognition, a proposed map, that is, of the structure of constructive cognitive processes of the human mind. Operations of the system must then be devised with limitations built into them that reflect in an appropriate manner the limitations of these same constructive powers of the mind. It is much in this sort of way that the constructivist attitude in the philosophy of mathematics must be understood. Realists, on the other hand, would construe the operations and elements of the formal map as having ontological significance independently of the constructive power of the human mind. Limitations built into the system, whether they apply to the notion of grammatical well-formedness or to the logistic behaviour of the ontological grammar, are evaluated then on grounds other than the nature of thought and

its inherent limitations. Some of the most obvious of such grounds for limitation pertain to the way the implicit metaphysical scheme underlying the system proposes to resolve the known antinomies.

Leibniz, as Gödel has pointed out, was one of the first expositors of this view of mathematical logic. Leibniz himself referred to such a formal system as a *characteristica universalis*. But it was not until Frege and Peano that any significant attempt at the construction of a formal ontology was made. Frege called his system a *Begriffsschrift*, indicating, as Gödel remarks, that "Frege was chiefly interested in the analysis of thought".(3) Frege himself in a response to Schroder's criticisms of his *Begriffsschrift* stated "that, unlike Boole's, his logic is not a *calculus ratiocinator*, or not merely a *calculus ratiocinator*, but a *lingua characteristica*.(4)

Now this Fregean emphasis on concepts (*Begriffe*) and the nature of thought is significant. For although it would seem, because of this emphasis, that Frege is a conceptualist and that therefore his logic would reflect certain limitations in the nature of human concept formation, it turns out that Fregean concepts are real, objective entities of a "mode of being" which is independent of minds and the subjective ideas by means of which minds think. To be sure, Fregean concepts are not self-subsistent entities, but their ontological dependence is upon the individual objects "falling under" them and not, apparently, upon the nature of thought. Their ontological dependence consists only in their being "unsaturated". They are nevertheless "real" entities in so far as Frege takes quantification over them as having ontological significance.(5) In this regard, Frege's ontology is realistic, though somehow it is also an analysis of thought.(6)

I shall not try to account here for this apparent ambiguity in the Fregean enterprise. I mention it in part because it is an ambiguity which Russell apparently shared (or perhaps even inherited from Frege) in the construction of his own formal ontology, the ramified theory of types, and which he never himself adequately resolved. As a formal embodiment of the Russell-Poincaré "vicious circle principle", the ramified theory of types purports to represent a limitation in the powers of human concept formation, specifically a limitation regarding impredicative concept formation. Adjoining the axiom of

reducibility to this formal ontology, however, can be justified only by taking a realistic attitude, an attitude which Russell clearly accepted in at least some of his writings.(7) The two attitudes taken together: the attitude, on the one hand, that the limitations imposed on both the ontological grammar and the logical constructions based upon that grammar are dictated by one's conceptualist views regarding at least the "higher-order" portion of one's ontology; and the attitude, on the other hand, that the reality represented by one's ontological grammar and the operations on that grammar is independent of mind and the nature of thought; these two attitudes though apparently not formally inconsistent, seem not to result in a philosophically coherent formal ontology. It is within this sort of context that I understand Myhill's concluding remark that "the ramified *Principia* itself falls uncomfortably between these two positions, and apparently does not correspond to any coherent philosophy of mathematics..." (p. 27).

Let us note that where Myhill speaks to the question of a coherent philosophy of mathematics, I have referred instead to the problem of a philosophically coherent formal ontology. The distinction is minor or not depending on how broad one's criteria are for the coherence of a philosophy of mathematics. Certainly, since the problem of the nature of mathematical existence is an ontological problem par excellence, every philosophically coherent formal ontology must contain a coherent philosophy of mathematics.(9) Tolerance forbids, I would suppose, maintaining the converse." (pp. 29-32)

(2) cf. G. Bergmann, "Ontological Alternatives", in E. D. Klemke (ed.), *Essays on Frege*, Urbana, Ill., 1968, p. 148: "Logic without ontology is merely a calculus. A calculus acquires philosophical import only if its author claims that it is an ideal language

(*Begriffsschrift*), i.e. that it perspicuously reflects an adequate ontology."

(3) Gödel, *op. cit.*

(4) J. van Heijenoort, "Logic as Calculus and Logic as Language", *Synthese* 17, 3 (1967), p. 324.

(5) Bergmann, *op. cit.*, p. 135, construes Frege's concepts as syncategorematic entities, but his only reason for this seems to be their ontological dependence on objects. We shall here understand a primitive symbol of a formal ontology to be a syncategorematic sign —and the entity, if any, it represents to be a syncategorematic entity — if it is not a substituend for (and the entity is not "indicated" by) any type of variable in the grammar of the system.

(6) cf. R. Grossman, "Frege's Ontology", in Klemke (ed.), *Essays on Frege*, for a discussion of this issue in regard to Frege's ontology.

(7) For example, in his *Introduction to Mathematical Philosophy*, he says that "logic is concerned with the real world just as truly as zoology, though with its more abstract and general features" (p. 169). We might note that the realism implicit in the reducibility axiom is one in regard to classes and not properties (or, in Russell's terminology, propositional functions). Indeed, Russell first referred to the axiom as "the axiom of classes". What is peculiar about this is that Russell took his formal ontology to be a "no class" ontology.

(8) Most proposals regarding the construction of a philosophically coherent formal ontology are programmatic and fragmentary and do not purport to constitute a completed metaphysical system. The importance of formally constructing such partial or fragmentary ontologies is not at issue here. Nor is it being suggested that a fragmentary ontology which defers the question of mathematical existence is for that reason incoherent. Of course, if such a fragmentary ontology cannot be extended so as to contain a coherent account of the nature of mathematical existence, especially vis-à-vis that of concrete or physical existence, then it does indeed represent a philosophically incoherent ontology, even if only fragmentarily. For this reason, metaphysical programmes should not long defer the question of containing a coherent philosophy of mathematics.

Predication theory and the Problem of Universals

"Predication theory has been a subject of philosophical concern since at least the writings of Plato and Aristotle. It is in its way the locus of a number of philosophical issues both in metaphysics and epistemology, not the least of which is the problem of universals. The latter problem, sometimes all too simply put as the question of whether there are universals or not, is especially Germane to the notion of predication since a theory of universals is at least in part a semantic theory of predication; and it is just to such a theory that we must turn in any philosophical investigation of the notion of predication. In doing so, however, we need not assume the truth or superiority of any one theory of universals over another. Indeed, an appropriate preliminary to any such assumption might well consist of a comparative analysis of some of the different formal theories of predication that can be semantically associated with these different theories of universals: for just as the latter provide a semantics for the former, it is only through the logical syntax of a formal theory of predication that the logical structure of a theory of universals can be rendered perspicuous. That, in any case, is the principal methodological assumption for the approach to the problem of universals we shall undertake in the present monograph where we will be more concerned with the construction and comparison of the abstract logical systems that may be associated with different theories of universals than with the metaphysical or epistemological issues for which they were originally designed. It is our hope and expectation, however, that these comparative formal analyses will be instrumental toward any philosophical decision as to whether to adopt a given theory of universals or not."

1. The problem of the predicable nature of universals

The original use of the term 'universal" goes back to Aristotle according to whom a universal is that which can be predicated of things (*De Interpretatione* 17 a 39). We shall retain the core of this notion throughout this essay and assume that whatever else it may be a universal has a predicable nature and that it is this predicable nature which is what constitutes its universality. Nothing follows from that assumption, however, regarding whether a universal is (1)

merely a predicate expression (nominalism) of some language or other; (2) a concept (conceptualism) in the sense of a socio-biologically based cognitive ability or capacity to identify, collect or classify, and characterize or relate things in various ways; or (3) a real property or relation existing independently of both language and the natural capacity humans have for thought and representation (realism). We propose to take each of these interpretations or theories of universals seriously in what follows at least to the extent that we are able to associate each with a formal theory of predication. Our particular concern in this regard, moreover, will be with the explanation each provides of the predicable nature of universals, i.e., of that in which the universality of universals consists. Our discussion and comparison of nominalism, conceptualism and realism, accordingly, will not deal with the variety of arguments that have been given for or against each of them, but with how each as a theory of universals may be semantically associated with a formal theory of predication. Our assumption here, as indicated above, is that insofar as such an associated formal theory of predication provides a logically perspicuous medium for the articulation of the predicable nature of universals as understood by the theory of universals in question, then to that extent the formal theory may itself be identified with the explanation which that theory of universals provides of the predicable nature of universals. It is in the sense of this assumption, moreover, that we understand a philosophical theory of predication to be a formal theory of predication together with its semantically associated theory of universals. (pp. 11-12)

From: Nino Cocchiarella, "*Logical Investigations of Predication Theory and the Problem of Universals*, Napoli: Bibliopolis 1986.

Theories of universal: A) Nominalism

“Traditionally, there have been three general types of approach to the problem of universals: nominalism, conceptualism, and realism, with nominalism being the most restrictive. Some forms of nominalism, more-over, are even more restrictive in this regard than others. We shall not concern ourselves with these variations here, however, but shall identify (generic) nominalism with three general semantical theses instead. The first general thesis of nominalism is that

universals have only a formal mode of existence, i.e., that beyond the predicate expressions that occur or can occur in language there are no universals. Predicate expressions, in other words, do not designate any universals beyond themselves; and therefore predicate expressions are the only entities according to nominalism that have a predicable nature. For this reason, we shall occasionally refer to predicate expressions as nominalistic universals.

We do not dispute here, it will be noted, that there are universals. That is, the problem of universals as we understand it here is not the problem whether there are universals; for indeed all theories of universals acknowledge that there are at least nominalistic universals, though some will assert that there are other universals as well. The problem of universals, as we have already said, is the problem of providing a philosophically coherent explanation of the predicable nature of universals, i.e., of that in which their universality consists. And in nominalism, this problem concerns the sense in which predicate expressions may be predicated of individuals.

The second general thesis of nominalism is the thesis of extensionality, i.e., the thesis that, semantically, predicate expressions may make no finer distinction of content than can be generated by co-extensive predicate expressions; and therefore the thesis that co-extensive predicate expressions are to be interchangeable *salva veritate* in any applied formal theory of predication suitable for nominalism. This means in particular that only an extensional logic is appropriate to nominalism, a corollary of which is anti-essentialism, i.e., the thesis that no nominalistic universal is necessarily true of some of the things of which it may be predicated without being necessarily true of all. It is sometimes claimed, we should note, that only the latter thesis, or a suitable reconstruction of it, is really necessary to nominalism and that in fact a nominalistic formal theory of predication may contain a modal, and therefore non-extensional, logic after all. We shall evaluate, and reject, this claim at a later section of this chapter. For now, however, we simply assume that nominalism requires the stronger thesis of extensionality.

The third general thesis of nominalism is that there are only individuals (in the logical sense), i.e., that quantificational reference is univocal and applies only to the individual things of which our various predicate expressions may be said to be either true or false. Whether, in addition, all and only concrete particulars are individuals, as has been maintained in more traditional variants of nominalism, we shall leave unspecified. Certainly some contemporary variants of nominalism, such as that of Quine's, include, e.g., sets as part of their ontology; and no doubt others may include other types of abstract individuals as well.

The third general thesis, it should be noted, does not follow from the first. E.g., one may consistently maintain that there are no universals other than predicate expressions but that the latter in their logico-grammatical role as predicate expressions are unsaturated linguistic structures; and therefore that there is a mode of quantificational reference, viz., that to possible predicate expressions, which is not a form of quantificational reference to individuals. Nevertheless, while it is consistent to maintain this, i.e., to affirm the first and deny the third general thesis of nominalism, we remain unsure that the result can he developed into a philosophically coherent theory of universals. (1) We, in any case, shall not attempt to associate such a combination with any formal theory of predication here. (2) As is well-known, the theory of predication which is commonly associated with nominalism today is standard first-order predicate logic (with identity). Indeed, standard articulation of the predicable nature of universals as understood by the theory of universals in question. Thus the association of nominalism with standard first-order predicate logic is intended not only as a validation of nominalism's three general semantical theses but also as an explanatory or clarifying thesis to the effect that the predicable nature of nominalistic universals, i.e., of possible predicate expressions, is the logico-grammatical role they are represented as having in the logical forms of standard first- order predicate logic (with identity).

We are in almost complete agreement with this association of nominalism with standard first-order predicate logic (with identity). Our one reservation concerns the fact that the latter, strictly speaking, occurs properly only as the logical component of applied first-order theories. That is, except for the possible use of dummy

schema predicate letters, first- order predicate logic cannot be described as a pure formal theory of predication. Dummy schema predicate letters can of course be transformed into predicate variables and quantifiers can be applied to these, resulting thereby in a pure second-order theory of predication. Typically, however, this move has been seen as a violation of nominalism's first general thesis in that it would appear to commit us to universals other than predicate expressions themselves. The move to a second-order logic, in other words, exceeds the limits of nominalism insofar as predicate quantifiers may be given a referential interpretation.

Fortunately, however, there is another interpretation of predicate quantifiers which does not transcend nominalism and the ontological framework of standard first-order predicate logic (with identity). This is the non-referential or so-called substitutional interpretation of predicate quantifiers whereby the significance of such a quantifier in the context of an applied first-order theory is exhausted by the totality of its substituends, i.e., predicate expressions in the form of the open propositional forms of that theory, rather than by a reference to either real or conceptual universals existing independently of the language of the theory and supplemental to its domain of discourse. By utilizing substitutionally interpreted predicate quantifiers, nominalism can of course be developed as a pure second-order theory of predication.

There will, however, be certain constraints which such an interpretation of predicate quantifiers imposes upon the specification of nominalistic universals; and these constraints are in fact precisely those involved first-order predicate logic is typically taken by nominalists precisely as we are recommending any formal theory of predication should be taken: viz., as a logically perspicuous medium for the in the comprehension principle of standard predicative second-order logic. In this regard we agree with the growing consensus that standard predicative second-order logic is an appropriate medium for the representation of a nominalist theory of predication. (3)" (pp. 29-32)

Notes

(1) Cf. the theory of universals represented by the logically perspicuous language described by Wilfrid Sellars in "Naming and

Saying", «Philosophy of Science», vol. 29, 1962, pp. 7-26. We believe this is really a conceptualist, and not a nominalist, theory of predication, however, albeit it is a form of conceptualism which is very close to nominalism.

(2) Cf. Cocchiarella, N., "Logical Atomism, Nominalism, and Modal Logic", «Synthese», vol. 31, 1975, pp. 23-62, where such an attempt is made, but with doubtful success, as is suggested in the article itself.

From: Nino Cocchiarella, "*Logical Investigations of Predication Theory and the Problem of Universals*, Napoli: Bibliopolis 1986.

Theories of universal: B) Conceptualism vs. Nominalism

"As cognitive capacities which may or may not be exercized on a given occasion, concepts are neither mental images nor ideas in the sense of particular mental occurrences. Concepts, in other words, and predicable concepts in particular, do not have an individual nature but are rather unsaturated cognitive structures whose realization or saturation in thought is what informs particular mental acts with a predicable nature.

Conceptualism, accordingly, rejects the third general thesis of nominalism, i.e., the thesis that there are only individuals, and therefore the sense in which there are concepts is not a restricted form of the sense in which there are individuals. Quantificational reference is not a univocal semantical notion in conceptualism, in other words, but is rather (at least) doubly aspected, depending on whether the reference is through the logico-grammatical role of a subject expression, and is therefore to individuals (in the logical sense), or whether it is through the role of an (*n*- place) predicate expression, and is therefore to (*n*-ary) concepts. (We shall also speak of «-ary concepts as *relational concepts* if $n > 1$.)

Conceptualism, of course, also rejects the first general thesis of nominalism, i.e., the thesis that there are no universals other than predicate χ expressions. Indeed, according to conceptualism, a

genuine predicate expression is precisely such only through having a concept as the semantic ground for its correct or incorrect application. This is not to say, on the other hand, that the possession of a concept will not come to be behaviorally equivalent to the possession of a linguistic ability to correctly apply a predicate expression having that concept as its semantic ground. Nor is it to deny that the possession of such a linguistic ability will naturally come to serve as a criterion for possession of the concept. Nevertheless, all questions of behavioral equivalence aside, being a criterion for the possession of a concept, according to conceptualism, is not the same as being that concept.

Despite their distinctness, however, concepts and predicate expressions do have analogous roles in their respective mediums, and to some ^ extent the development of concepts in the medium of thought is determined by the development of predicate expressions in the medium of language — just as the development of language is determined in part by the development of thought. In holistic conceptualism especially, as we shall see, impredicative concept-formation is a generalized capacity which is achieved only through the capacity for language, and in particular through the capacity to systematically use language for the expression of constructive or predicative concepts. In this regard, impredicative concept-formation is a mediated process, and language and the linguistic ability to use predicate expressions to express predicative concepts is the means used to master and direct such a process. Aside from this meditation, however, the laws of compositionality for systematic concept-formation in holistic conceptualism, and in particular the impredicative comprehension principle (CP) for predicable concepts, greatly exceed the principle of compositionality in nominalism, viz., the comprehension principle (CP!). In this regard, in other words, there can be no question of reducing or otherwise explaining only in terms of nominalistic universals the formal theory of predication we shall come to associate with holistic conceptualism. The prospects are better, no doubt, for a reduction of constructive conceptualism to nominalism; and indeed, in a sense, the formal theory of predication we shall associate with constructive conceptualism is contained in the formal theory determined by nominalism, viz., standard predicative second-order logic.

Nevertheless, whereas it is predicativity in the purely grammatical sense which is the basis of nominalism's formal theory of predication, it is predicativity in the logico-grammatical sense which is the basis of constructive conceptualism's formal theory of predication; for, as we shall see (in §2), it is only in this sense that we are to understand the closure conditions of the comprehension principle (CCP!) of constructive conceptualism's formal theory of predication. Unlike the situation in nominalism, in other words, where wffs that are predicative in the purely grammatical sense are ipso facto predicative in the logico-grammatical sense, in constructive conceptualism not all wffs (of an applied context) that are predicative in nominalism's purely grammatical sense need also be predicative in the logico-grammatical sense.

One of the consequences of this difference, as we shall see (in §3), is a corresponding difference in the notion of a possible {explicit) definition of a predicate constant. For whereas predicate constants are the paradigms of predicative expressions in nominalism, in constructive conceptualism not all predicate constants of an applied context need themselves be predicative, i.e., they need not all stand in that context for the value of a bound predicate variable. Thus, unlike the situation in nominalism, predicate constants can be definitionally introduced in an applied context of constructive conceptualism with definiens that are impredicative in either or both the purely grammatical and the logico-grammatical sense. That is, whereas such definitions can be proved to be both non-creative and eliminable in constructive conceptualism, they will be both creative and non- eliminable in nominalism, i.e., in standard predicative second-order logic.

These are not trivial or unimportant differences, needless to say, and they indicate the radically different philosophical perspectives involved in a conceptualist as opposed to a nominalist theory of predication. Differences not mentioned here, such as the reducibility or irreducibility of identity in an applied context (cf. §4), and the typical rejection of nominalism's second general thesis, i.e., the thesis of extensionality, only add to the picture of the important philosophical differences between nominalism and conceptualism. Their only point of real similarity in fact is their common denial — or commitment to denial — of there being anything at all like the so-

called logical modalities, since the same argument that proves the essential incompleteness of first-order modal logic described in Chapter I also proves the essential incompleteness of any higher order framework such as those we shall consider here (cf. §9)." (pp. 71-73)

From: Nino Cocchiarella, "*Logical Investigations of Predication Theory and the Problem of Universals*, Napoli: Bibliopolis 1986.

Theories of universal: C) Realism

“Realism, like conceptualism, goes beyond nominalism in positing the existence of universals other than predicate expressions. Unlike conceptualism, however, the existence of a real universal does not depend upon the existence of the intellect. That is, real universals exist independently of both language and the natural capacity humans have for thought and representation. In keeping with tradition, we shall refer to real universals as properties and relations.

Now the sense in which properties and relations are said to exist is not the same in all forms of realism. We assume, however, that despite their differences all forms of realism fall under two general and exclusive types which we shall call natural and logical realism, respectively. We agree of course that the differences between two variants of a given type may affect the sense in which each claims that there are real universals; but we maintain nevertheless that there is a common core of agreement between these variants which distinguishes them in a radical way from all variants of the other type. It is this agreement and distinction, respectively, which is the basis for our classification of realism into what we will call natural and logical realism.

In all variants of natural realism, for example, properties and relations are said to exist only within nature and that in particular they are integral components of the causal structure of the world. Such universals may exist independently of what is not determined by the causal structure of the world, and in that sense they may be said to exist independently of the world itself (considered as a whole); but, on the other hand, they cannot also exist independently of the causal structure of the world, and in that regard they cannot exist independently of all causal alternatives to the actual world

where the same laws of nature hold as hold in the actual world. Traditionally, these universals have been called material properties and relations; but this did not always mean that they were the properties and relations posited in one or another form of materialism — and in particular it did not mean that the only universals in question are physical properties and relations, i.e., the fundamental properties and relations posited in physics. The terminology rather harks back to a distinction between concepts which were said to have a material as opposed to a merely formal significance (as constructions of the intellect), which is only to say that it is a distinction between concepts to which such real universals correspond as opposed to those to which no such real universals correspond. We shall not adopt this terminology here ourselves however, since we wish not to suggest, even inadvertently, that natural realism is committed to one or another form of materialism. Materialism, to be sure, is committed to one or another variant of natural realism (to the extent that it admits properties and relations at all); but not all variants of natural realism, it must be emphasized, need be committed to materialism. What is assumed in natural realism as a general type is only that somehow nature contains within its causal matrix all the properties and relations there are, regardless of whether these properties and relations are those only of physics, or also of chemistry, or also of biology, or also of any other natural science whatsoever.

Now all variants of logical realism, it should be noted, take a completely opposite stand on this issue. That is, all variants of logical realism maintain that real properties and relations exist independently not only of what is not determined by the causal structure of the world but also of that causal structure itself — and, indeed, even of whether there is a world at all! Logically real universals, in other words, exist independently of all forms of concrete existence and the causal grounds for such. They do not exist independently of one another, to be sure, but that dependence obtains only in a timeless, transcendent realm of being which, according to all variants of logical realism, is in fact the semantico-ontological ground for the logical truths we express in thought and language — and it is for this reason, needless to say, that we refer to such a theory of universals as a variant of logical realism. Thus,

unlike the situation in natural realism, it is assumed in all variants of logical realism that there is a real universal corresponding to every fully applied wff φ(x1,..., xn), including those which are logically determinate, i.e., those which are logically true or logically false of any individuals whatsoever.

Traditionally, because of their independent and transcendent mode of being, logically real universals have been called Platonic forms. However, because Platonism in general also assumes that universals are individuals, we shall avoid that label here, since there are also variants of logical realism (e.g. Gottlob Frege's) in which properties and relations are assumed to have only a predicable and not also an individual nature; i.e., variants in which logically real universals are in some sense only unsaturated structures.

It is not clear, incidentally, that natural realism can also allow for variants in which natural properties and relations have an individual as well as a predicable nature. In modal natural realism, for example, we argue that natural properties and relations can only be causally determinate unsaturated structures (the saturation of which results in the facts or states of affairs that obtain in the world). We believe a similar argument can be given with respect to the actual world alone, i.e., independently of modal considerations, if it is allowed that the same natural property or relation need have no instantiations at all during an interval of time between two or more of its instantiations. This argument, however, depends on temporal considerations (where moments, of time play the role of possible worlds) which we shall not go into here (since it requires a formulation of relativity theory as well); and for this reason we shall leave open the question whether all variants of natural realism are committed to natural properties and relations being only causally determinate unsaturated structures; i.e., whether in some variants of natural realism natural properties and relations have an individual as well as a predicable nature.

Finally, it should be noted that there are variants of both natural and logical realism which are committed to the thesis of extensionality as well as those which are committed to its denial and which we shall refer to here as modal natural and modal logical realism, respectively." (pp. 105-107)

Books

1. Cocchiarella, Nino. 1966. *Tense Logic: A Study of Temporal Reference*.

   Unpublished Ph.D. Dissertation, available at ProQuest Dissertation, reference number 6609326.

   University of California - Los Angeles, January 7, 1966). Committee in charge: Richard Montague, Charmain, Alfred Horn, Donald Kalish, Abraham Robinson, Robert Stockwell (VI, 251 pages).

   N.B. *the unpublished Ph. D. thesis can be ordered to ProQuest Dissertation Express*.

   Abstract: "This work is concerned with the logical analysis of topological or non-metrical temporal reference. The specific problem with which it successfully deals is a precise formalization of (first-order) quantificational tense logic wherein both an appropriate formal semantics is developed and a meta-mathematically consistent and complete axiomatization for that semantics given.

   The formalization of quantificational tense logic herein presented adheres to all the canons of logical rigor by being carried out entirely as a definitional extension of (Zermelo-Fraenkel) set theory. Model-theoretical techniques are utilized in the semantics given and the notion of a history is formally developed as the tense-logical analogue of the notion of a model

for standard first-order logic with identity. Corresponding to the key semantical concept of satisfaction (and consequently of truth) in a model, by means of which the central standard notion of logical truth is defined, the notion of satisfaction (and consequently of truth) in a history at a given moment of that history is developed, from which development, in turn, the central notion of tense-logical truth is defined. An axiomatic characterization of derivability within tense logic, or t-derivability, is then presented and proved to be both consistent and complete, i.e., it is shown that an arbitrary tensed formula is tense-logically true if and only if it is t-derivable from zero premises, i.e., if and only if it is a theorem of the given axiomatic system.

Quantification within tense logic introduces issues in no manner confronted on the sentential level. Recognition is made that quantification over objects existing prior to the time of assertion is to be distinguished from quantification over objects existing at the time of assertion, both of which in turn are to be distinguished from quantifying over objects existing at the time of assertion. Such distinct kinds of quantification are readily distinguishable within tense logic by means of incorporation of what is here called the logic of actual and possible objects. Precise semantical and syntactical formalization of this double quantification is presented prior to its use within tense logic, and completeness theorems are given for both the full system. and the restricted logic of actual objects, the latter of which may separately be taken as a formalization of a logic which can accommodate denotationless names. These several kinds of quantificational logic lead to separate completeness theorems stated and established for tense logic, depending on the several kinds of quantificational bases possible for this logic."

Table of Contents: Vita, Publications and Field of Study V; Abstract 1;

Chapter 1. The Metalanguage 3

§ 1. Terminology 3

§ 2. Syntax 8

Chapter 2. Formalization of a Logic of Actual and Possible Objects 15

§ 1. Semantics 17

§ 2. Logical Axioms, Derivations and Theorems 23

§ 3. Completeness of the Logic of Actual and Possible Objects 35

§ 4. Standard Logic and the Logic of Denotationless Terms 47

Chapter 3. The Semantics of Tense Logic 59

§ 1. Histories, Moments and Momentary States 60

§ 2. Satisfaction, Truth and Validity in a History 66

§ 3. Tense-Logical Truth 76

§ 4. R-Validity 78

Chapter 4. An Axiomatic Formulation of Tense Logic 95

§ 1. Tense-Logical Axioms, t-theorems and t-derivations 96

§ 2. Partial Histories, Historical Sequences and Complete Decompositions 141

§ 3. A Completeness Theorem for Tense Logic 217

§ 4. Tense Logic with Quantification only over Possibilia 231

§ 5. Tense Logic with Quantification only over Actual Objects 233

   Table of Contents: Preface 9; Introduction 11; Chapter 1. Nominalism 29; Chapter 2. Conceptualism 65; Chapter 3.

Realism 105; Chapter 4. On The Logic of Nominalized Predicates and Its Philosophical Interpretations 165; Chapter 5. Complex Predicates and The Lambda - Operator 215; Chapter 6. Two Fregean Semantics For Nominalized Complex Predicates 243-265.

"Beginning with Aristotle's notion of a universal as that which can be predicated of things, I provide in this monograph separate logical analyses of what nominalism, conceptualism and realism take to be the predicable nature of universals. My position throughout is that such an analysis proceeds through the construction of a formal theory of predication on the one hand and a logical semantics on the other. I adopt and apply in this regard the formal and semantical techniques of my former teachers Rudolf Carnap and Richard Montague.

One important way in which I differ from Carnap and Montague, however, is in our respective analyses of so-called "higher order" sentences - that is, sentences in which nominalized predicates, whether simple or complex, occur as the logico-grammatical subjects of other predicates. In this regard, whereas Carnap and Montague formulate and adopt one or another version of a theory of simple logical types as the framework within which to analyze such sentences, I formulate instead, relative to nominalism, conceptualism and realism, systems which do not require any grammatical type distinctions beyond those already found in standard second order predicate logic. All of the theories of predication formulated in this monograph, in other words, are second order theories, including those which contain a logic of nominalized predicates. Russell's paradox of predication, it turns out, can be resolved without resorting to a theory of types." (From the *Preface* p. 9)

4. ———. 1987. *Logical Studies in Early Analytic Philosophy*. Columbus: Ohio University Press.

   Table of Contents: Preface XI-XII; Introduction 1; Chapter 1. The Development of the Theory of Logical Types and the Notion of a Logical Subject in Russell's Early Philosophy 19; Chapter 2. Frege, Russell, and Logicism: A Logical

Reconstruction 64; Chapter 3. Meinong Reconstructed versus Early Russell Reconstructed 119; Chapter 4. Frege's Double Correlation Thesis and Quine's Set Theories NF and ML 152; Chapter 5. Russell's Theory of Logical Types and the Atomistic Hierarchy of Sentences 193; Chapter 6. Logical Atomism and Modal Logic 222; Chapter 7. Logical Atomism, Nominalism, and Modal Logic 244; Index 285-293.

"The Essays collected here deal with the development of analytic philosophy in the first quarter of the twentieth century. In addition to providing a historical account of early analytic philosophy, these Essays also contain logical reconstructions of Frege's, Russell's, Meinong's, and Wittgenstein's views during the period in question. Several of these reconstructions can and have been used in the new logico-linguistic developments in pragmatics and intensional logic that make up the vanguard of contemporary analytic philosophy. Others, such as the interpretation of the logical modalities in logical atomism, or the determination of the objects of fiction and dreams in Meinong's theory of objects or Russell's early logic, provide a useful introduction, if not also a solution, to a number of problems confronting analytic philosophy today. Indeed, for that matter, all of the Essays collected here provide a useful propaedeutic to much of the research now going on in the study of logic and language.

A number of small changes have been made in all of the Essays reprinted here, mainly for stylistic purposes. Their histories are briefly indicated as follows. Chapter 1 first appeared in *Synthese*, vol. 45, no. 1 (September I980):71—115, Copyright © 1980 by D. Reidel Publishing Company, Dordrecht, Holland. A somewhat longer version of chapter 2 first appeared in *Frege Synthesized*, L. Haaparanta and J. Hintikka (eds.), 1986, pp. 197-252, Copyright © 1986 by D. Reidel Publishing Company, Dordrecht, Holland. The present version was given as a lecture in a seminar on 13 March 1985, for the Bertrand Russell Editorial Project at McMaster University. Chapters 3 and 4 first appeared in *Journal of Philosophical Logic*, vol. 11, no. 2 (May, 1982): 183-214, and vol. 14, no. 1 (February 1985): 1-39, respectively, Copyright © 1982 by D. Reidei Publishing

Company, Dordrecht, Holland. Chapter 3 was originally given as a lecture to the Société Belge de Logique et de Philosophie des Sciences, Brussels, in December 1981. Chapter 4 was my contribution to An Interdisciplinary Conference on Logic, Truth and Type Theory, given in memory of Alfred Tarski, 6-7 April 1984. Chapter 5 first appeared in *Essays in Bertrand Russell's Philosophy*, C. Wade Savage and C. Anthony Anderson (eds.), 1987, Copyright © by University of Minnesota Press, Minneapolis. Chapter 6 first appeared in *Philosophia, Philosophical Quarterly of Israel*, vol. 4, no. 1 (January 1974):41-66. It is reprinted here with the permission of the editor. Chapter 6 was given as a lecture to the Victoria Conference on Formal Ontology at the University of Victoria on 15 October 1972. Chapter 7 first appeared in *Synthese*, vol. 31, no. 1 (June 1975):23-62, Copyright © 1975 by D. Reidel Publishing Company, Dordrecht, Holland. It was originally given as a lecture to the University of North Carolina Fall Philosophy Colloquium in October 1973." (*Preface*, pp. XI-XII)

5. ———. 2007. *Formal Ontology and Conceptual Realism*. New York: Springer.

   Table of Contents: Preface XI; Introduction XIII-XXIII;

   I. Formal Ontology.

   1. Formal ontology and conceptual realism 3; 2. Time, Being and Existence 25; 3. Logical necessity and logical atomism 59; 4. Formal theories of predication 81; 5. Formal theories of predication part II 101; 6. Intensional possible worlds 121;

   II. Conceptual Realism.

   7. The nexus of predication 139;

   8. Medieval logic and conceptual realism 169; 9. On Geach against general reference 195; 10. Leśniewski's Ontology 215; 11. Plurals and the logic of classes as many 235; 12. The logic of natural kinds 273; Afterword on Truth-Makers 295; Bibliography 297; Index 307-316.

   "The history of philosophy is replete with different metaphysical schemes of the ontological structure of the world.

These schemes have generally been described in informal, intuitive terms, and the arguments for and against them, including their consistency and adequacy as explanatory frameworks, have generally been given in even more informal terms. The goal of formal ontology is to correct for these deficiencies. By formally reconstructing an intuitive, informal ontological scheme as a formal ontology we can better determine the consistency and adequacy of that scheme; and then by comparing different reconstructed schemes with one another as formal ontologies we can better evaluate the arguments for and against them, and come to a decision as to which system it is best to adopt.

This book is divided into two parts. The first part is on formal ontology and how different informal ontological systems can be formally developed and compared with one another. An abstract set-theoretic framework, which we call comparative formal ontology, can be used for this purpose without assuming that set theory is itself a superseding ontological system. The second part of this book is on the formal construction and defense of a particular ontological scheme called conceptual realism. Conceptual realism is to be preferred to alternative formal ontologies for the reasons briefly described below, and for others as well that are given in more detail in various parts of the book. Conceptual realism, in other words, is put forward here as the best ontological system to adopt." (From the *Introduction*, p. XIII)

6. Cocchiarella, Nino, and Freund, Max A. 2008. *Modal Logic. An Introduction to its Syntax and Semantics*. New York: Oxford University Press.

   Table of Contents: 1. Introduction 1; 2. The syntax of modal sentential calculi 15; 3. Matrix semantics 45; 4. Semantics for logical necessity 61; 5. Semantics for S 5 71; 6. Relational world systems 81; 7. Quantified modal logic 119; 8. The semantics of quantified modal logic 153; 9. Second-order modal logic 183; 10. Semantics of second-order modal logic 215; Afterword 253; Bibliography 257; Index 263-268.

"Modal logic is a theoretical field that is important not only in philosophy, where logic in general is commonly studied, but in mathematics, linguistics, and computer and information sciences as well. This book will be useful for students, researchers, and professionals in all of these and related disciplines. The only requirement is some familiarity with first-order logic and elementary set-theory.

The main outline of this book is a development of the logical syntax and semantics of modal logic in three stages of increasing logical complexity. The first stage is a comprehensive development of sentential modal logic, which is followed by a similarly comprehensive development of first-order modal predicate logic. The final stage is a development of second-order modal predicate logic. These stages are introduced gradually, with increasing difficulty at each stage. Most of the important results in modal logic are described and proved in each of their respective stages.

This book is based on a series of lectures given over a number of years at Indiana University by the first author. A draft of the book has also been used by the second author in Costa Rica and Mexico. The book is organized as follows.

We begin in chapter 1 with concatenation theory and the logistic method. By means of this theory and method we describe the construction of expressions, formal languages, and formal systems or calculi. Different modal calculi are then constructed in chapter 2. These cover all of the well-known systems, S1–S5, of Lewis and Langford's 1932 classic *Symbolic Logic*. As already indicated, these systems are constructed first on the level of sentential (or propositional) logic and then later in chapter 7 on the level of first-order predicate logic, where we distinguish the quantified modal logic of actualism from that of possibilism.

The systems are then extended yet again to the level of second-order modal predicate logic in chapter 9, where the notion of existence that is central to the actualism-possibilism distinction is given a deeper and finer-grained analysis in terms of

existence-entailing concepts, as opposed to concepts that do not entail existence." (From the *Introduction*, p. 1)

    "Arthur N. Prior, in the Preface of Past, Present and Future, made clear his indebtedness to “the very lively tense-logicians of California for many discussions”. Strangely,with a notable exception of Copeland (Logic and reality: Essays on the legacy of Arthur Prior, 1996), there is no extensive discussion of these scholars (as a group, if not a school) in the literature on the

history of tense logic. In this paper, I propose to study how Nino B. Cocchiarella, as one of the Californian tense-logicians, interacted with Prior in the late 1960s. By gathering clues from their correspondence available at Virtual Lab for Prior Studies, I will highlight some of the differences between their views on tense-logic, which might still have far-reaching philosophical implications. I will conclude with a sketchof how to study in what ways Prior and Cocchiarella influenced some other Californian tense-logicians."

    "This article is a critical review of Cocchiarella's theory of reference. In conceptual realism, there are two central distinctions regarding reference: first, between active and deactivated use of referential expressions, and, second, between using referential expressions with and without existential presupposition. Cocchiarella's normative restrictions on the existential presuppositions of reference lead to postulating two fundamentally different kinds of objects in conceptual realism: realia or concrete objects, on the one hand, and abstract intensional objects or nonexistents, on the other. According to Cocchiarella, nonexistents can be referred to only without existential presuppositions. However, referring to nonexistents with existential presuppositions is an ordinary human practice. To account for this fact, Cocchiarella's normative theory of

reference should be supplemented by a descriptive account of referring."

Annotated bibliography of Nino Cocchiarella 1966-1977

Essays 1966-1977

1. Cocchiarella, Nino. 1966. "A Logic of Actual and Possible Objects." *Journal of Symbolic Logic* no. 31:688.

   See note in 1966c.

2. ———. 1966. "A Completeness Theorem for Tense Logic." *Journal of Symbolic Logic* no. 31:689.

   See note in 1966c.

3. ———. 1966. "Modality within Tense Logic." *Journal of Symbolic Logic* no. 31:690.

   Note to the reprint of these three items in Karel Lambert (ed.) *Philosophical Applications of Free Logic*, New York: Oxford University Press 1991): " The abstracts are summaries of lectures given at the December, 1965 meetings of the Association for Symbolic Logic.

   (A preliminary version of those lectures was given at UCLA in 1963, and a final version was given at UCLA in the spring of 1965 at a public lecture constituting the defense of my doctoral dissertation.)"

4. ———. 1968. "Some Remarks on Second Order Logic with Existence Attributes." *Noûs* no. 2:163-175.

   "In *Past, Present and Future* A. N. Prior bas suggested an approach towards the concept of existence where, following

medieval logicians, we are to distinguish "between predicates (like 'is red', 'is hard', etc.) which entail existence, and predicates (like 'is thought to be red, 'is thought of', etc.) which do not" (p. 161). Let us refer to attributes (including relational attributes) which are designated by the former kind of predicate as existence attributes, or for brevity, e-attributes. It is suggested then that "x exists" is to be defined as "there is some e-attribute which x possesses". A formalization of this (at least) second order logic of existence was recently brought about and reported on by the present author in [6]. The formalization was shown to be complete in the sense corresponding to the completeness of standard second order logic, i.e. in the sense which encompasses normal, non-standard as well standard models. (Cfr. A. Church, *Introduction to Mathematical Logic* (1956) - § 54). I should like in the present paper to discuss some of the philosophical issues involved in this formalization as well as some issues concerning the general notion of e-attribute." (p. 163)

5. ———. 1969. "A Substitution Free Axiom Set for Second Order Logic." *Notre Dame Journal of Formal Logic* no. 10:18-30.

   "In what follows we present an adequate formulation of second order logic by means of an axiom set whose characterization does not require the notion of proper substitution either of a term for an individual variable or of a formula for a predicate variable. The axiom set is adequate in the sense of being equivalent to standard formulations of second order logic, e.g., that of Church [1]. It is clear and need not be shown here that every theorem of the present formulation is a theorem of the formulation given by Church. It of course will be shown here, however, that each of Church's axioms are theorems of the present system and that each of his primitive inference rules is either a primitive (and only modus ponens is taken as a primitive rule here) or a derived rule of the present system.

   The importance of obtaining an axiomatic formulation such as herein described lies partly in the significance of reducing any axiom set to an equivalent one which involves fewer metalogical notions, especially such a one as proper substitution. However, of somewhat greater importance, it is

highly desirable that we possess a formulation of both first and second order logic which can be extended without qualification to such areas as tense, epistemic, deontic, modal and logics of the like. Now proper substitution especially has been the main obstacle to such unqualified extensions of standard logic, and we take it to be of no little significance that at least for first order logic (with identity) a substitution free axiomatic formulation has been provided. (1) The present system extends this earlier result to the level of second order logic. (2)

A second difficulty in unqualified extensions of standard logic concerns the form which Leibniz' law, i.e., the law regarding interchangeability salva veritate, is to take. Generally, in the extensions of standard logic to modal logic, this law has been formulated in an unqualified form applicable to all contexts, thereby lending credence to the questionable view that only "intensions" or the like can serve adequately as values of the variables for such systems. In the substitution free formulations of first order logic cited, however, Leibniz' law is axiomatically formulated only for atomic contexts, and the qualified form or forms the law takes for contexts involving non-standard formula operators is given in the statement of metatheorems. (3) But again, it is a far different matter having such qualifications stipulated in the form of metatheorems as opposed to having them built directly into the characterization of the logical axioms. As we have said, it is desirable that the standard logical axioms for either first or second order logic be so that axiomatic extensions of standard logic can be made without qualification.4 This desirable feature of the substitution free formulations of first order logic mentioned is retained in our present second order system." (pp. 18-19)

(1) Such a formulation is given by A. Tarski in [2] and developed byD. Kalish and R. Montague in [3]. The present author in [4] and [5] has also formulated a substitution free axiomatization of first order logic without "existential presuppositions."

(2) Of course, when extending either first or second order logic to tense, epistemic, deontic, or modal logic, qualifications in

metatheorems regarding principles of proper substitution will be required. Nevertheless, it is a far different matter having such qualifications stipulated in the form of metatheorems than it is having them built directly into the characterization of the logical axioms themselves.

(3) cf. [4], lemma 4.27 (p. 108) and the discussion on page 106. The objections against an unqualified, general version of Leibniz' principle (or interchangeability *salva veritate*) are applicable when certain special 'Opaque" contexts are involved, be they modal or otherwise. But all such contexts are—or should be when properly formalized—other than atomic, their "opacity" being generated within the scope of special formula operators. Atomic formulas, because they are atomic, will contain no occurrences of such operators and consequently will uphold par excellence the Leibnizian principle unqualifiedly."

"A. N. Prior in [9] has suggested an approach towards a second order logic of existence where, following medieval logicians, we distinguish “between predicates (like ‘is red’, ‘is hard’, etc.) which entail existence, and predicates (like ‘is thought to be red’, ‘is thought of’, etc.) which do not.“(2) Let us refer to attributes (including relational attributes) which are designated

by the former kind of predicate as existence attributes, or for brevity, e-attributes. It is suggested then that *x exists' be defined as 'there is some e-attribute which x possesses'. In what follows, this approach regarding the concept of existence is formalized semantically as well as syntactically, and a completeness theorem is established corresponding to the completeness (in a secondary sense, i.e., as including normal, nonstandard models) of standard second order logic (as formulated, for example, in Church [1])."

"Recently, in [5], I formulated a second order logic of existence which centered around the distinction between those attributes that entail existence and those that do not. (1) The distinction provides

an especially apt explication of the concept of existence and is for this reason especially pertinent to pragmatics and intensional logic, encompassing as they do such areas as tense, epistemic, deontic and modal logic.(2) For example, apropos of tense logic some attributes, such as being red, being round, being hard, etc., cannot be possessed at a time except by objects existing at that time. Other attributes, especially relational attributes between objects whose "lifespans" need not overlap, such as being an ancestor of everyone (someone) now existing, being remembered by someone now existing, (3) etc., may very

well be possessed by objects which no longer exist; others, e.g., being a future descendant of everyone (someone) now existing, may be possessed by objects which have yet to exist. Still other attributes such as being believed to be a flying horse may be possessed by objects which never exist. Those attributes which entail existence (at the time of their possession) I shall call existence attributes, or for brevity, e-attributes. By a relational e-attribute I mean an attribute which entails existence with respect to each of its argument places.

In the present paper I shall discuss some of the motivation for distinguishing e-attributes from attributes in general. As indicated, this motivation depends essentially on the desire to use logistic systems in which we are allowed to recognize modes of being other than that of actual existence, e.g., such modes in tense logic as past and future existence, or, in the logic of belief, the mode of "intentional inexistence". As also indicated, the concept of existence is central to this discussion and I shall here examine informally its explication in terms of e-attributes. In a sequel to the present paper I shall present and discuss a formal analysis of this explication in the context of a semantics for standard second order logic, with quantification over e-attributes distinguished from quantification over attributes in general. The focal point of the formal discussion will be the issue of the logical priority of the notion of e-attribution over that of being an existing object, a priority which exemplifies that of the intensional over the extensional and which, for its clarification, requires some observations on the class-attribute distinction." (pp. 33-34)

(1) For a more philosophical discussion of the axiom set for this formalization, see [4]. I follow Carnap [1], p. 5, in using attribute' to comprehend both properties and relations (in-intension). Properties are 1-place or unary attributes and are designated by 1-place predicate expressions. Extending Carnap's terminology, propositions are understood to be designated by 0-place predicate expressions and are therefore construed as 0-place attributes (whose extensions are truth-values).

(2) Cf. R. M. Montague [9] and [10] for an elegant and philosophically stimulating formulation of pragmatics and intensional logic. Montague's formulation of intensional logic, supplemented by the distinction between existence entailing and other kinds of attributes, is perhaps the most appropriate general logical framework to which the discussion and observations of the present paper lead.

(3) This example is given by R. M. Montague in [9] and [10].

"In what follows we present a second order formulation of S5 which is shown to be complete relative to a secondary sense of validity corresponding to that relative to which standard second order logic is known to be complete.(1) In our semantical metalanguage we consider various indexed sets of possible worlds and allow that not all objects existing in one indexed world need exist in another. However, as we have therefore confessed in the metalanguage our ontological commitment to all the objects that exist in one world or another, we acknowledge and formalize this confession in our object languages through allowing for quantification over *possibilia*.

Our means for distinguishing the existent from the mere possible is through a distinction between those attributes that entail existence (with respect to each of their argument places), referred to hereafter as e-attributes, and those attributes that do not.2 Accordingly, we understand 'x exists" to mean There is some e-attribute which x possesses", thus rendering existence essentially impredicative. An alternative and equivalent route—but which we shall not follow here—is possible through taking existence as primitive in the form of quantification over existing objects and defining e-attributes as those attributes which necessarily are possessed only by existing objects." (p. 81)

"Russell’s supposed paradox of predication has occasionally been cited as a source for lessons in ontology. So, for example, Grossmann in [6] has argued that one of the lessons of Russell’s

paradox is that there are no complex properties. A recent re-evaluation of the supposed paradox, however, has led me to the conclusion that there is no paradox (cf. [3]). And of course where there is no paradox, there are no lessons of paradox.

There may, however, be lessons of non-paradox, especially if instead of contradiction what results is a highly instructive ontological oddity. In what follows I shall briefly review the considerations that led me to conclude that there is no paradox but instead only this ontological oddity with instructive lessons of its own, relative of course to the ontological framework within which it occurs. I shall then briefly consider several ways of responding to this oddity, where each response presupposes an alternative ontological framework relative to which the response accounts for the oddity by either showing it to rest on an ontological error, as with Grossmann's response, or by mitigating its effect through what purports to be a deeper or wider framework than the original one in which the oddity occurs." (p. 165)

Contributions to a seminar on ontology held under the auspices of the New York University Institute of Philosophy for the year 1970-1971.

"Russell's paradox has two forms or versions, one in regard to the class of all classes that are not members of themselves, the other in regard to "the predicate: to be a predicate that cannot be predicated of itself."(1) The first version is formulable in the ideography of Frege's *Grundgesetze der Arithmetik* and shows

this system to be inconsistent. The second version, however, is not formulable in this ideography, as Frege himself pointed out in his reply to Russell. (2) Nevertheless, it is essentially the second version of his paradox that leads Russell to avoid it (and others of its ilk) through his theory of types.

The first version is of course the relevant version with respect to any formulation of the theory of types in which membership in a class is the fundamental notion, that is, a formulation utilizing 'ε' as a primitive binary predicate constant.(3) However, Russell's theory of types (even ignoring its ramification) is essentially concerned with the notion of predication, and only indirectly through the (philosophically questionable) interpretation of predication as the membership relation is the first version of his paradox relevant to this formulation.

Apparently, Russell saw his paradox as generating an aporetic situation in regard to two fundamental “notions,” namely, the notion of membership (in a class) and the notion of predication (of an attribute).(4) In regard to the notion of membership, the application of Russell’s paradox is not here brought into question. However, in regard to the notion of predication, the applicability of the reasoning grounding Russell’s paradox will here be very much brought into question. Indeed, I shall claim that in this case the paradox fails.(5)" (pp. 133-135)

(2) “Letter to Russell,” ibid., p. 128.

(3) Cf. [5], p. 140 for a specific formulation of this kind of type theory.

(4) Gödel (cf. [6], p. 131f.) distinguishes these two forms of Russell’s paradox by referring to them as the “extensional” and the “intensional” forms, respectively. For the purposes of the present paper, this distinction is preferable to Ramsey’s different but better known distinction between “logical” and “semantical” paradoxes.

(5) With this failure of course goes a primary if not sole motivation for the simple theory of ontological types of third and higher order. The ontological scheme of second-order logic remains unaffected, having as it does a natural motivation of its own. Ramification also has its own motivation, and it may be appended to second-order logic (cf. [2], §58.) even though historically it was first appended to the simple theory of types.

"T* is a logistic system1 designed to represent the original ontological context behind Russel's paradox of predication. It encompasses standard second order logic, hereafter referred to as T, but goes beyond it by allowing predicate variables to occupy subject positions in its formulas.

Because of a violation of the restrictions imposed for the proper substitution of a formula for a predicate variable, RusselΓs argument fails in T*. Indeed, not only is T* consistent but it is also a conservative extension of T.

It has been suggested that one way of understanding this result is to construe occurrences of predicates in subject positions as referring, not to the properties which occurrences of the same predicates in predicate positions designate, but instead, to individual objects associated with these properties.4 Such a suggestion of course is reminiscent of Frege's ontology. And were it not that Frege is quite insistent in viewing predicates as

"unsaturated" expressions and therefore not qualified as substituends for subject positions which can be occupied only by "saturated" expressions, it might be tempting to construe T* as representative of Frege's ontology. Be that as it may, the disproof of the principle that indiscernible properties are co-extensive, which is all that RussellΓs paradox comes to in T*, is reinterpreted according to this suggestion so as to show merely a variant of Cantor's theorem. And that after all is rather appropriate, since Russell's argument for his supposed paradox is really but a variant of Cantor's argument for his theorem.

In what follows we formulate the suggestion semantically and show that although the semantics thus provided does not characterize T*, it does characterize a certain rather interesting subsystem T** of T* supplemented by the extensionality principle that co-extensive properties are indiscernible.(5) The supplemented system, T**+(Ext*), no doubt appears bizarre from the point of view of the original ontological background represented by T*—since in this ontology not all indiscernible properties are co-extensive whereas, according to the supplement, all co-extensive properties are indiscernible, thus suggesting co-extensiveness to be a stronger connection between properties than is the indiscernibility relation.

On the other hand, from the point of view of its quasi-Fregean semantics, the supplement seems rather natural—for according to this semantics the supplement amounts to the stipulation that the same individual object is to be associated with co-extensive properties. Fregean naturalness aside, it should perhaps be noted that the existence of a model-set-theoretic semantics characteristic for T*—or of T* supplemented with principles natural to the ontology of T*—remains yet an open problem." (pp. 552-553)

(2) Cf. [2], §6.

(3) Ibid., §5. We should avoid using 'identical' in place of indiscernible' here. In [3], Meyer has shown that according to T* there exists no relation which satisfies full substitutivity, and, accordingly, insofar as full substitutivity is taken to be a

necessary feature of identity, there is and can be no identity relation in the ontology of T*.

(4) This suggestion is implicit, though only in a partial way, in the argument independently arrived at by Zorn and Meyer that T* is a conservative extension of T. It is explicit in the type of model defined below as quasi-Fregean and first recommended to the author as characteristic of T* by N. Belnap.

(5) It is easily seen from the proof in [2] that T* is a conservative extension of T, that this extensionality principle is not a theorem of T*—nor for that matter is its negation.

"In his paper, 'The Undefinability of the Set of Natural Numbers in the Ramified *Principia'*, [*] Myhill has shown that the general concept of a natural number or finite cardinal - general enough, that is, to yield the induction schema - is not definable in terms of ramified type theory in essentially its original form and without the axiom of reducibility. In my commentary I shall examine Myhill's concluding philosophical remarks within the context of general metaphysics or what below I call formal ontology. I shall especially be concerned with the sense in which ramified type theory (without the axiom of reducibility) purports to represent a constructive philosophy of mathematics. In addition, I shall sketch several forms of realism according to which the claim that "impredicativity is present in mathematics from the beginning" is true in an especially apt and interesting sense that goes beyond that intended by Myhill." (p. 29)

[*] In George Nakhnikian (ed.), *Bertrand Russell's Philosophy*, pp. 19-27.

13. ———. 1974. "Logical Atomism and Modal Logic." *Philosophia.Philosophical Quarterly of Israel* no. 4:41-66.

    Reprinted as Chapter 6 in *Logical Studies in Early Analytic Philosophy*, pp. 222-243.

    "Logical atomism has been construed as both a realist and a nominalist ontology. Despite their different ontological commitments, proponents of both types of atomism have tended to agree that modal operators for necessity and possibility, and thereby strict entailment too, are totally alien to the ontological grammar of logical atomism. The reason for this, apparently, is that any inclusion of modal operators in the ontological grammar of logical atomism, whether that grammar be of the nominalist or realist variants, would represent a commitment to internal properties and relations with material content. And in logical atomism, of course, all internal properties and relations, be they of objects or of situations, are formal and not material in nature. (Cf. Wittgenstein, *Tractatus Logico-Philosophicus*, ([TR]), 4.122).

    However, to the contrary, we shall argue that not only are propositional connectives for logical necessity and possibility, and thereby strict entailment too, no more alien to the ontological grammar of logical atomism than are connectives for conjunction and disjunction, but, moreover, that the formal or internal properties and relations of objects and situations in the ontology cannot be adequately represented by the propositional forms of that grammar unless connectives for logical necessity and possibility are included (or definable by others so included) therein.

    That is, we shall argue that connectives for logical necessity and possibility, together with their proper “logico-syntactical employment” ([TR], 3.327), represent formal, and not material, internal “properties,” and, moreover, that these formal, internal “properties” are part of the ontology of logical atomism and cannot be adequately represented without the inclusion of such

connectives in the ontological grammar of any formal system purporting to represent that ontology.(1)

Our position and argument, incidentally, applies only to modal operators for logical necessity and possibility. All other modal operators, we agree, because they purport to represent internal "properties" or "relations" with real material content (e.g., causality, and even temporality via tense logic), are strictly prohibited within the metaphysical framework of logical atomism. "Superstition is nothing but belief in the causal nexus" ([TR], 5.1361). "The only necessity that exists is logical necessity" ([TR], 6.37).

Moreover, our concern here shall be with logical atomism as the metaphysical framework for a type of formal ontology. Our concern will not be with logical atomism as the framework for either a theory of meaning or a theory of knowledge. Accordingly, neither the Carnapian theory of *Protokolsätze* nor the Tractarian picture theory of meaning are essential to our present purely ontological considerations. We should note, however, that the Tractarian theory of elementary propositions as pictures contains both a theory of predication and a theory of meaning. It is the theory of predication that is an essential part of the ontology of logical atomism.

In the present chapter we shall limit our formal developments to the level of analysis dealing solely with propositional connectives. Our next chapter will deal with nominalist logical atomism where only individual variables are bindable but where atomism's theory of predication enters the ontological grammar in a fundamental way. That chapter will also contain a description of several variants of realist logical atomism, one in which material properties and relations of objects are themselves objects, and another where material properties and relations of objects, though indicated by bound predicate variables (as in the first variant of realism), are not themselves objects (values of individual variables) but are nexuses or modes of configurations of objects (as they are in nominalism where they are not indicated by bound predicate variables)." (pp. 222-223 of the reprint)

15. ———. 1974. "A New Formulation of Predicative Second Order Logic." *Logique et Analyse* no. 65-66:61-87.

    "In what follows, a predicative second order logic is formulated and shown to be complete with respect to the proposed model theoretic semantics. The logic differs in certain fundamental ways from the system formulated by Church in [1] § 58. The more important differences are noted and discussed throughout the present paper. A more specialized motivation for the new formulation is outlined in § 2.

    In regard to the motivation for Church's formulation, this will be found in its natural extension to ramified type theory (without the axiom of reducibility). Within this larger framework, the theory of predication represented by such a formulation can be seen to be constructive: higher order entities are constructible from entities of lower order, with real, nonconstructed individuals as the entities of lowest order. Set theory, to whatever extent it is representable in the framework, appears in the ramified hierarchy only after propositional functions are allowed to be arguments of third and higher order predicates. To introduce sets as real, non-constructed individuals of lowest order would be antithetical to the framework's constructive theory of predication and in violation of its philosophical motivation."

    (...)

    "Essential to this proposal, however, is a view of the predicative/impredicative distinction radically different from that found in ramified type theory — and hence in Church's formulation of predicative second order logic. The latter framework (barring the axiom of reducibility) represents a constructive theory of predication that rules out all manner of

categorial content (indicated by bound predicate variables) or logistic efficacy for impredicative contexts. In the proposed, modified Fregean theory, however, impredicative contexts (wffs) are allowed to have logistic efficacy — and perhaps even categorial content if standard quantifiers ranging over all properties and relations are retained as well.

If, on the one hand, only quantifiers for predicatively specifiable properties and relations are allowed, then in this new formulation of predicative second order logic impredicative contexts — which in general will contain free (schematic) predicate variables or certain predicate constants — will be syncategorematic expressions, since they will not then be permissible substituends of generalized predicate variables. This does not mean that they must then be accorded null content. They may instead represent logical or formal content variant to what Frege calls second and third level "concepts". (4)

This logical content would in effect be the basis of their logistic efficacy. (5)

If, on the other hand, these impredicative contexts are to be given categorial content by retaining standard quantifiers, then care must be made to distinguish these quantifiers from those ranging over only predicatively specifiable properties and relations. Both kinds of quantifiers will bind the same variables, but impredicative wffs will be permissible substituends only of variables bound by the one quantifier. (6)

They remain impermissible substituends of variables bound by the quantifiers for predicative properties and relations.

In the system to be formulated here we are concerned only with the first of the above alternatives, although once formulated it is easily extended to the richer framework. (7)" (pp. 61-64)

(4)We should distinguish at least two kinds of content that expressions of a formal system might have. The first is generally called descriptive, but historically has been called categorial, which we prefer here since even without (applied) descriptive constants the content is still indicated by bound

variables, (Hence our reference to categorial content.) The second is generally called logical or formal, or, traditionally, syncategorematic and is understood to be immanent to the logistic system in question. This latter content is usually said to be null or non-existent because it is not denoted or designated by corresponding constants, or, equivalently, because it is not indicated by any type of bound variable. (It may however be «indicated» in a secondary sense by free or schematic variables, and therefore also by constants that are substituends of these free or schematic variables.)

This rather standard view is untenable, however; for if the corresponding or associated expressions have logistic efficacy in the system, that fact can be accounted for only in terms of their representing content of some sort.

On the other hand, because of its immanency, this content need not be therefore accorded categorial existence, i.e., it need not be indicated by bound variables. Our point here, however, is that categorial existence is not the only philosophically viable notion of existence. In ramified typetheory (without the axiom of reducibility), impredicativity has neither categorial nor syncategorial existence. In the new predicative second order logic, impredicativity has syncategorial but not categorial existence. In standard second order logic, impredicativity has categorial existence.

(5) A perspicuous representation of this logistic efficacy is the rule (S) of substitution of wffs for free (schematic) predicate variables or constants occurring in theorems. (Cf. 4 below for a description and derivation of (S).) This rule, though derivable in the predicative second order logic formulated here, is not derivable in Church formulation. Indeed, its addition there as a new rule results in standard, and not predicative, second order logic. This is not the case in the new formulation given here.

(6) The principle of universal instantiation, (UI), of wffs those containing as well as those not containing bound predicate variables — for a generalized predicate variable is now both formulabale and valid when the generalized predicate variable is bound by the standard quantifier. This principle implies the

weaker rule (S) and therefore contains, and goes beyond, the logistic efficacy of that rule. (7)" (pp. 61-64)

[1] Church, A., *Introduction to Mathematical* Logic, Princeton University Press, 1956.

16. ———. 1975. "On the Primary and Secondary Semantics of Logical Necessity." *Journal of Philosophical Logic* no. 4:13-27.

"The semantical development of modal logic over the past fifteen years has incorporated a particular model-theoretic artifice which has received little or no critical attention. It is our contention that this artifice introduces, at least within conceptual frameworks typified by logical atomism, a subtle form of descriptive as opposed to merely formal content into the semantics of modal operators. This is particularly noteworthy at least for systems containing operators for the so-called logical modalities, e.g., logical necessity or possibility, or their cognate binary modality, strict implication; for, if any modal operators or connectives had ever been conceptually ordained to represent merely logical or formal operations with no material or descriptive content, it is such as these. Yet, as a result of this model-theoretic artifice, that is precisely what they fail to do.

Relative to a given non-empty universe of objects and a set of predicates of arbitrary (finite) addicity (representing the nexuses of atomic or basic states of affairs), the artifice in question concerns allowing modal operators to range (in their semantical clauses) over arbitrary non-empty subsets of the set of all the possible worlds (models) based upon the given universe of objects and the set of predicates in question. The intuitive and natural interpretation of modal operators for logical modalities, however, is that they range over all the possible worlds (models) of a logical space (as determined by a universe of objects and a set of predicate-nexuses) and not some arbitrary non-empty subset of that totality. The latter interpretation, by allowing the exclusion of some of the worlds (models) of a logical space, imports material conditions into the semantics of modal operators. This exclusion, however

appropriate for the representation of non-logical (e.g., causal or temporal) modalities, is quite inappropriate for the representation of what are purported to be merely formal or logical modalities.

This model-theoretic artifice of allowing the exclusion of some of the worlds (models) of a logical Space goes back to Kripke [5] where the notion of universal validity is used instead of the intuitive and primary notion of logical truth. Later semantical developments, by Kripke and others, retained the artifice and supplemented it with additional model-theoretic features, e.g., special accessibility relations between the non-excluded worlds, or semantical clauses allowing objectual quantifiers to range over arbitrary subsets of the universe of objects (thereby importing material content into the semantics of these operators as well). Such additions only deepened and supplemented the type and variability of the material content already induced by modal operators as a result of the artifice in its simplest form. And in that regard, however appropriate these additions may be for the representation of particular non-logical modalities, they only mark a further departure from the supposed purely formal content of operators for logical modalities. For this reason we shall ignore these later developments here and restrict our observations to some of the implications of the artifice in its original and simplest form. It should be kept in mind, however, that our discussion pertains only to operators for the so-called logical modalities." (pp. 13-14)

(...)

"Concluding remarks.

It is not our contention that we should eschew either the model-theoretic artifice of allowing modal operators to range over only some and not all of the worlds (models) of a given logical space or the related artifice of allowing («-place) predicate quantifiers to range over only some and not all of the sets (of «-tuples) of objects in the universe of that space. Indeed, we agree that such artifices are quite appropriate and may in fact be required for operators purportedly representing

non-logical modalities (e.g., temporal or causal modalities) or for quantifiers which purportedly range over attributes of a restricted form of content (e.g., perceptual content, or existence-entailing content where past- and future-existence are distinguished from present-existence).

It is our contention, however, that the employment of such an artifice is inappropriate in the semantics of what one considers to be a purely formal or syncategorematic sign. The fact that a secondary semantics which includes such an artifice yields a proof of completeness where the primary semantics showed incompleteness instead does not itself justify employment of the artifice. Rather, to adopt a secondary semantics for this sort of reason is, in our view, to already call into question the sense in which the sign is said to be syncategorematic or the sense in which the content purportedly represented is said to be of a purely formal nature. That of course may in the end be the appropriate question to raise in regard to all our so-called syncategorematic or logical constants. But to raise the question and to answer it adequately are two entirely different enterprises." (p. 28)

17. ———. 1975. "Second Order Theories of Predication: Old and New Foundations." *Noûs* no. 9:33-53.

"Second-order theories of predication are based on the assumption that a semantical or ontological interpretation of the forms of predication found in first-order languages will be philosophically adequate only if within the framework of the interpretation there exist entities corresponding to (some if not all of) the predicates occurring in these forms. These entities, depending on the theory in question, may or may not be projected as existing in reality independently of the structure of thought. For convenience, however, we shall refer to them in either case as properties when they are projected as corresponding to monadic predicates and as n-ary relations

when they are projected as corresponding to n-place predicates, for n > 1.

Now the nature of the correspondence in which properties and relations are purported to stand to predicates in second-order theories is such that it cannot be identified with or reduced to the relation of denotation between singular terms, e.g., individual constants or variables, and the individuals or objects which they are understood to denote. In some second-order theories it cannot be understood as a relation at all, though in others it will (properly) include the singular-term denotation relation (in the sense that properties and relations can also be denoted therein by singular terms) while still going beyond it in ways that are peculiar to predicates. For this reason, quantification over the theoretically projected or posited properties and relations is primarily effected through quantified predicate variables and not, as it were, through a form of restricted quantification over one or another kind of individual. Informally, we say that properties and relations have in this regard a *predicative nature*, though in some theories they may have a *nominative* nature as well.

In what follows we shall be concerned, though somewhat unevenly, with this distinction between second-order theories in which properties and relations have only a predicative nature as opposed to those in which they are purported to have a nominative nature as well. The two general types of second-order theory we have in mind, then, are distinguished according to (1) whether the nature of the correspondence between predicates on the one hand and properties and relations on the other is to (properly) include the singular-term denotation relation so that predicates, within the framework of the theory, are allowable substituends of individual variables; or (2) whether the purported mode of being of properties and relations is strictly of a predicative nature which excludes their being arguments or logical subjects of predication in any sense which is logically similar to that in which individuals in general are. In the first type of theory, properties and relations are themselves individuals, i.e., have a nominative as well as a predicative nature, whereas in the second the categories or

modes of being purportedly indicated by quantified predicate and individual variables are ontologically disjoint. Following Frege, we shall speak of properties and relations as *unsaturated* entities when they are projected entities of a theory of the latter sort." (pp. 33-34)

18. ———. 1975. "Logical Atomism, Nominalism, and Modal Logic." *Synthese* no. 31:23-62.

    Reprinted as Chapter 7 in *Logical Studies in Early Analytic Philosophy*, pp. 244-275.

    "Logical atomism, through its theory of logical form, provides one of the most coherent formal ontologies in the history of philosophy. It is a coherence which, whether we agree with the ontology or not, renders the framework important and useful as a paradigm by which to compare and better evaluate the coherence of alternative systems based upon alternative theories of logical form and especially alternative theories of predication.

    As the basis of a formal ontology, logical atomism, aside from the differences between its realist and nominalist variants, specifies not only a 'deep structure' ontological grammar within which all analysis must ultimately be resolved, but determines as well a logistic for that grammar. Both together constitute the formal ontology and serve to indicate how logical atomism views the fundamental structure of reality. Thus, for example, the grammar serves to indicate the formal as well as the material categories of being acknowledged by the ontology, while the logistic, by regulating the proper 'logico-syntactical employment' ([TR], 3.327) of the expressions of that grammar serves to indicate not only the logical 'scaffolding of the world' ([TR], 6.124) but supplements the grammar in its presentation of the ontological structure of reality.

    The distinction between logical scaffolding and ontological structure is fundamental to atomism and pertains to a distinction between material and formal content that grammar alone is insufficient to represent. It is a distinction that any proposed formalization of logical atomism must account for (through the Doctrine of Showing) in order to be an adequate

formal representative of that ontology. It is a distinction, however, or so it will be argued here, that cannot be made without the introduction of modal operators for logical necessity and possibility.

The argument for this last claim was already given in chapter 6, but it was there restricted to the level of logical analysis dealing solely with propositional connectives."

(...)

"In what follows we shall be concerned with the problematic extension of these results to the level of analysis involving quantifiers for objects as concrete particulars along with some means for expressing their self-identity and mutual difference. On this level, logical atomism's theory of predication enters our considerations in a fundamental way. For according to that theory, only elementary predications represent or 'picture' a structure with material content, and that content is in all cases external to the constituents of the structure. Such a structure is an atomic situation (*Sachlage*) and the externality of its content to its constituents consists in both it and its complement being logically possible. The difficulty here is that since objects are quantified over, they are part of the world and therefore contribute to the ontological content of the world (cf. [TR] 5.5561); and in that regard their self-identity and mutual difference or nonidentity, and thereby their total number, would prima facie seem to involve material content. Yet, in atomism, an object's self-identity or nonidentity with any other object is not an external condition of that object, (3) and, as a consequence of the dependence of logical space on reality, it is logically impossible for the totality of objects, no less the number of that totality, to differ from world to world. In other words, in logical atomism, if not in other ontologies, identity and difference, as well as objectual quantification, are formal and not material aspects of reality. Here already we begin to see the paradigmatic role of logical atomism, for in most other systems identity and difference, as well as objectual quantification, are also said to be formal in content, though

propositions regarding that content are not also said to be either logically necessary or logically impossible.

Because our considerations will be restricted to quantifying over objects as concrete particulars and not, for example, over material properties and relations as well, the variant of logical atomism we shall discuss here is nominalistic. Several realist alternatives are sketched in order to highlight the significant theses and/or difficulties of nominalism, though it should be noted that not all forms of nominalism need agree with the special ontological theses of nominalist logical atomism.

Finally, it should also be noted that our concern in this chapter is with an adequate formal representation of the ontology of logical atomism and not with its theory of thought, meaning, or philosophy of language. We wish to leave open how these might or must be developed with respect to the system constructed here, especially with regard to how they might or must pertain to the question of its logistic completeness." (pp. 244-247 of the reprint)

(1) The convention adopted here is to use scare-quotes when speaking of what connectives represent as ‘properties’ or ‘relations’. This is done to mark a special philosophical use which is convenient in our informal discussion but which strictly speaking is ontologically misleading. A similar convention applies throughout when we refer to existence (being-the-case) and nonexistence (being-not-the-case) as material ‘properties’ of atomic situations.

(3) That is, an object’s self-identity or nonidentity with any other object is invariant through all the possible worlds of a logical space containing that object. We must distinguish this ontological invariance from the varying semantical relation of denotation (*Bedeutung*) between an object and a (non-Tractarian) name or definite description of that object. The former must be accounted for within the formal ontology, the latter only within its applications.

19. ———. 1975. "A Second Order Logic of Variable-Binding Operators." *Reports on Mathematical Logic* no. 5:13-18.

    "It is well-known that Prego distinguished between first- and second-level concepts or functions. First-level concepts he associated with properties and relations between objects. These concepts Frege characterized as functions which assigned truth-values (the true or the false) to (n-tuples of) object(s) (1). An (n-tuple of) object(s) was said to fall under such a concept if it was assigned the true by that concept. In his *Begriffsschrift* these concepts were indicated by predicate variables.

    Second-level concepts or functions, on the other hand, correspond to variable binding operators, e.g., the universal quantifier or, as in Frege's later development of the Begriffsschrift, the course-of-values abstraction operator. The latter assigns to a monadic concept the class which is its extension while the former assigns a truth-value. Second-level concepts, i.e., second-level functions corresponding to variable-binding operators of the quantifier type, accordingly, can be associated with properties or relations between properties and relations of objects in a sense analogous to (but also different from) that in which first-level concepts are associated with properties or relations between objects. In Frege's terminology, while an (w-tuple of) object(s) is said to fall under a first-level concept, the latter is said to fall within, not under, a second-level concept if it is assigned the true by that concept.

    Third-level concepts corresponding to quantifiers binding predicate variables were also introduced into the *Begriffsschrift*, but Frege seems to have had some doubts regarding their ontological or objective significance. Indeed, Frege's attitude toward third-level concepts seems in general to resemble the nominalists' attitude toward second-level concepts, viz., that they are merely formal or syncategorematic concepts which are immanent to the *Begriffsschrift* and correspond to nothing objective in reality.

The objectivity of first- and second-level concepts, however, was said by Frege to be “founded deep in the nature of things” (2). These concepts, in other words, have an objective and not merely a formal or syncategorematic content according to Frege. Accordingly, from the point of view of rendering one’s ontological commitments explicit by means of appropriate quantifiers, this indicates that in a framework such as the *Begriffsschrift* we should allow not only for third-level quantifiers binding predicate-variables (having first-level concepts as their values), as Frege explicitly did allow, but also for fourth-level quantifiers binding second-level quantifier variables (having second-level concepts as their values), as Frege only implicitly allowed. This he did in effect by allowing free or schematic occurrences of second-level quantifier variables (as affixed to schematic individual variables)."

(...)

"Finally, we should perhaps point out that not all second-level concepts need be quantifier concepts. E.g., Frege himself took the “property” of being a property of the number 2 to be a second-level concept ([4], p. 75), and no doubt he intended there to be such a second-level concept corresponding to each and every object. In the present system we remain faithful to Frege’s intentions. Indeed, by (CP-2), it is valid here that for each object x there exists a second-level concept within which fall all and only those first-level concepts under which x falls.

Our approach to the semantics of variable-binding formula operators differs in this regard from that of Mostowski [8], Thomason and Johnson [9], and Issel [5], [6], [7], all of whom, aside from restricting their considerations to first order languages (and, generally, to 1-ary 1-place quantifiers), interpret such operators as designating “quantities” of first-level concepts, i.e., they restrict their considerations to quantifier concepts.

The present system includes these sorts of second-level concepts but goes beyond them to include others as well. However, since the ‘quantifier’ terminology is simpler and more convenient than referring to variable-binding formula

operators, we shall hereafter conflate the latter with the former and speak only of “quantifiers”, though of course now quantifiers do not in all cases represent “quantities” (6)." (pp. 13-15)

(1) Frege apparently allowed only for binary relations. We extend his framework to include n-ary relations for arbitrary finite n ^ 2. In addition, we refer to all these relations as (n-ary) concepts. (Frege referred only to properties as concepts.)

(2) *Function and Concept*, p. 41 of [3].

(6) So-called branched quantifiers represent second-level concepts that are somewhat anomalous to quantifier concepts in general, i.e., to “quantities”. It is well-known, however, that the semantic content of these quantifiers is representable in second order logic, and, accordingly, these concepts too are included among those represented in the system formulated below.

21. ———. 1976. "On the Logic of Natural Kinds." *Philosophy of Science* no. 43:202-222.

"A minimal second order modal logic of natural kinds is formulated. Concepts are distinguished from properties and relations in the conceptual-logistic background of the logic through a distinction between free and bound predicate variables. Not all concepts (as indicated by free predicate variables) need have a property or relation corresponding to them (as values of bound predicate variables). Issues pertaining to identity and existence as impredicative concepts are examined and an analysis of mass terms as nominalized predicates for kinds of stuff is proposed. The minimal logic is extendible through a *summum genus*, an infima species or a partition principle for natural kinds."

"A standard objection to quantified modal logic is that it breeds such reptiles of the mind as Aristotelian essentialism, “the doctrine that some of the attributes of a thing (quite independently of the language in which the thing is referred to, if at all) may be essential to the thing, and others accidental” ([5], p. 173f.). This objection has been criticized on one front by pointing out that none of the standard systems of quantified modal logic commit us to more than the meaningfulness of the non-trivial versions of the doctrine and that indeed we can, if we so choose, actually deny such versions in these systems (cf. [4]). A more heroic response, however, accepts these versions of the doctrine, at least when properly stated, and finds quantified modal logic the appropriate medium for its

formulation. In what follows I shall attempt to formulate one such response, at least for the purpose of clarifying the general sort of logistic framework it presupposes if not also for exposing some of the more fascinating serpents that breed therein." (p. 202)

(...)

"Concluding Remarks. The above are only some of the more obvious principles that come to mind in the development and application of a logic of natural kinds. My objection to including them within the minimal system is based solely upon the rather strong sense of independence from the structure of thought (and therefore of “logic”) which I assume natural kinds to have. Of course, in certain restricted contexts or for specialized applications these principles, and perhaps others as well, may be fully justified and used accordingly.

There are of course other developments and applications which I have not touched upon at all in this paper, e.g., the analysis of causal counterfactuals as based upon natural kinds or of a comparative similarity relation between individuals in terms of the natural kinds they share, etc. Our interests in these sorts of developments or applications should, it is hoped, vindicate at least to some extent the ontology of natural kinds as causal or nomological essences. In any case, such reptiles of the mind as these are taken to be by some philosophers seem hardly poisonous or deadly at all.

Finally, there is the sort of application suggested in section 4 for extending the logic of natural kinds to include nominalized predicates so as to provide a general analysis of the logic and ontology of mass terms. I have only hinted throughout this essay at how this richer framework might be developed, and though I do have some further suggestions which I have not gone into here, it is hoped that perhaps others will also take up the clarion call to defend this rather fascinating serpent of the mind." Abstract: "There are different ways in which we might investigate and represent the successive stages of the development of our common-sense and scientific conceptual frameworks. Jean Piaget’s “fundamental hypothesis” regarding this development is that there is a parallelism between the progress made in the logical and rational organization of knowledge and the corresponding formative psychological processes” ([9], p.13). Piaget’s approach has been a general inquiry into our formative psychological processes, a type of inquiry that requires us “to take psychology seriously” (ibid., p.9). There is an alternative for philosophical logicians, however. For while it is not within our expertise to investigate formative psychological processes, we can nevertheless contribute to the study and representation of “the logical and rational organization of knowledge” through the construction of theories of logical form that are characteristic of at least some of the more important stages in the development of our common-sense and scientific frameworks. We adopt the methodology of such a construction in this paper where our primary concern will be the logical structure of our referential devices for quantifying, identifying and classifying things.

We will be concerned in particular with how this structure is to bear upon the problem of cross-world and cross-time re-identification."

"Investigations into the logical structure underlying ordinary language and our common-sense framework have tended to

support the hypothesis that there are different stages of conceptual development and that while the structures elaborated at a later stage are in general not explicitly definable or reducible to those at the earlier they nevertheless presuppose them as conceptually prior bases for their own construction and elaboration— even when the conceptually prior structures are somehow eliminated or completely reconstructed at the later stages. This applies, moreover, not just to the conceptual structures underlying our common-sense framework but to those underlying the development of logic, mathematics and the different sciences as well.

Jean Piaget, for example, as a result of his investigations into genetic epistemology has found that our knowledge of logico-mathematical structures is obtained through a process of "constructive" or "reflective" abstraction that proceeds through a hierarchy of successive stages at which the structures acquired at a previous stage are reconstructed before they are integrated into the new structures elaborated at later stages (cp. [10], p.159). But, as Piaget has also shown, it is not just in logic and mathematics that cognitive activity develops through successive stages of progressive structuration; for the development of intelligence and knowledge in general, whether as represented in our common-sense or our scientific framework, proceeds in essentially the same way. Indeed, the construction of our scientific framework on the basis of our common-sense framework is itself a prime example not only of how conceptual structures acquired at a previous stage are completely reconstructed before they are integrated into those elaborated at a later stage but also of how the later structures, though built upon the earlier, cannot be reduced to or defined in terms of them (cf. Sellars [11]).

Now there are different ways in which we might investigate and represent the successive stages of the development of our commonsense conceptual framework. E.g., because of his "fundamental hypothesis" that there is a parallelism between the progress made in the logical and rational organization of knowledge and the corresponding formative psychological processes" ([9], p.13), Piaget's approach has been a general

inquiry into our formative psychological processes. The first principle of genetic epistemology, according to Piaget, is “to take psychology seriously” (ibid., p. 9).

There is an alternative for philosophical logicians, however. For while it is not within our expertise to investigate our formative psychological processes, we can nevertheless contribute to the study and representation of “the logical and rational organization of knowledge” through the construction of theories of logical form that are characteristic of at least some of the more important stages in the development of our common-sense and scientific frameworks.

One thing in particular that the construction of such a theory would help explain is the sense in which the operations and co-ordinations of concepts that characterize a given stage of conceptual involvement constitute a self-sufficient structured whole which purports to have limits beyond which there is nothing for thought. It would also help explain how the formalization of these operations and the clarification of their limits can be the basis for new and more elaborate operations whose structuration transcends those same limits and leads to a new stage of conceptual involvement.

It is this methodology that we shall adopt in what follows where our primary concern will be the logical structure of our referential devices for quantifying, identifying and classifying things. We shall particularly be concerned with how this structure is to bear upon the problem of cross-world and cross-time re-identification." (pp. 439-441)

Annotated bibliography of Nino Cocchiarella 1978-1992

Essays 1978-1992

1. Cocchiarella, Nino. 1978. "On the Logic of Nominalized Predicates and Its Philosophical Interpretations." *Erkenntnis* no. 13:339-369.

   Errata, *Erkenntnis*, 14, 103-104, pp. 103-104.

   "Predicate nominalizations are transformations of predicates and predicate phrases into nouns or noun phrases. Thus, e.g., 'pious' is transformed into 'piety', 'wise' into 'wisdom', 'triangular' into 'triangularity', and 'human' into 'humanity'. We call these types of derivative nouns abstract singular terms. Some relational predicates are also transformed into abstract singular terms: e.g., 'identity' for 'is identical with' and 'indiscernibility' for'is indiscernible from'.

   There are other forms which predicate nominalizations take as well. E.g., the noun phrase 'the concept Horse', especially as used by Frege, amounts to a nominalization of the predicate 'horse', and others of a related sort are 'the property red' and 'the relation of being taller than'. These nominalizations have stylistic variations, e.g., 'redness' or 'red' simpliciter (when used as a singular term rather than as a predicate) and 'the taller-than relation' or simply 'being taller than'.

   There are no doubt a number of distinctions relevant to linguistics that should be drawn between these different types of nominalizations. We, however, shall not pursue them here

but shall concern ourselves instead with the more formal question of a logic of nominalized predicates in the context of some of its philosophical interpretations. We shall assume in this regard that the occurrences of nominalized predicates in ordinary discourse for which the logic is designed are all singular termsin the modern sense, i.e., that they purport to have singular reference in the same sense in which proper names and (unreduced) definite descriptions are said to have such reference." (p. 339)

2. ———. 1979. "The Theory of Homogeneous Simple Types as a Second Order Logic." *Notre Dame Journal of Formal Logic* no. 3:505-524.

   "In its original form the theory of simple types, hereafter called ST, is a theory of predication and not, or at least not primarily, a theory of membership. With that original form in mind we construct in this paper a second order counterpart of ST which we call ST*. We briefly compare ST* with an alternative extension of second order logic, viz., the author's system T*(*) of [1], which was proposed as characterizing the original (and yet consistent!) logistic background of Russell's paradox of predication.

   In [2], the author showed the completeness of T**, plus an extensionality axiom (Ext*), relative to a Fregean interpretation of subject-position occurrences of predicates, viz., that such occurrences of predicates denote individuals correlated with the properties (or "classes") designated by predicate-position occurrences of the same predicates. It is observed here that when the semantical Fregean frames characterized satisfy ST*'s stratified comprehension principle instead of T**'s general comprehension principle, then the same Fregean interpretation yields a completeness theorem for monadic ST* + (Ext*) as well. It has been found convenient, on the other hand, to consider (monadic) ST as a theory of membership rather than a theory of predication when axioms of extensionality are

   included in its characterization. So considered, Quine proposed his system NF as a first order counterpart of ST, though of course, as is well-known, NF far exceeds ST in deductive

powers. We show here per contra that while (monadic) ST* + (Ext*) is motivated in its construction along lines followed by Quine in the construction of his first order counterpart NF, viz., the reduction of ST's metatheoretic feature of typical ambiguity to a stratified comprehension principle, our system, unlike NF, is equiconsistent with ST. This, along with the fact that the non-abstract individuals (or "urelements") of ST are retained unmodified in ST*, indicates that ST*, as a theory of predication, is to be preferred to NF, as a theory of membership, in the interpretation which each gives to STPs metatheoretic feature of typical ambiguity. We show in addition that if to (monadic) ST* +(Ext*) we add the assumption that whatever is a value of an individual variable is also (or, on the Fregean interpretation, is correlated with) a value of a (monadic) predicate variable, i.e., the assumption that every individual is a "class", then the resulting system is equiconsistent with NF. We refer to monadic ST* +(Ext*) as NFU* and show that it contains Jensen's system NFU as well." (pp. 505-506)

3. ———. 1980. "Nominalism and Conceptualism as Predicative Second Order Theories of Predication." *Notre Dame Journal of Formal Logic* no. 21:481-500.

"There appears to be a growing consensus, even if not unanimity, that standard predicative second-order logic is the appropriate logical medium for the representation of a nominalist theory of predication. We agree that this is indeed the case and formulate in this paper a model-theoretic approach which justifies that claim. (1) Because it is model-theoretic, our approach differs from the truth-value semantics approach of Leblanc and Weaver. (2) Amongst other reasons,

we prefer our model-theoretic approach so as to accommodate those nominalists for whom the assumption that there are potentially as many names as there are individuals is not acceptable.

The models involved in our semantics, moreover, are precisely the same models as are already involved in standard first-order logic. Assignments of values (drawn from the domain of a given model) to the individual variables are extended, however, to what, relative to a given first-order language, we call *nominalistic assignments* to the *n*-place predicate variables (for each positive integer *n*) these assign first-order formulas (wffs) of the language in question, relative to the free occurrences of *n* distinct individual variables occurring in those wffs, to the H-place predicate variables. The satisfaction by such an assignment of a second-order wff in a model is then defined by a double recursion on the logical structure of the wff and on the number of nested predicate quantifiers occurring therein.

It is natural of course that a first-order wff, relative to *n* individual variables occurring therein as argument indicators, should be understood as representing an *n*-place predicate expression of the language in question; and in fact in an applied first-order theory based upon that language such a first order wff would constitute the definiens of a possible definition for an *n*-place predicate constant not already belonging to that language or occurring in that theory. Potentially, of course, there are infinitely many predicate constants that might be introduced into a first-order theory in this way; and it is just over such a potential infinity, and no more, that our predicate quantifiers, nominalistically interpreted, are understood to range when we turn to the predicative second-order counterpart of a given first-order theory.

Finally, in order to better understand the implicit background of our nominalistic semantics, we include in a final section of this paper a brief comparison of nominalism, as represented by standard predicative second-order logic, with a closely related form of conceptualism, represented by a certain nonstandard

predicative second-order logic formulated by the author in an earlier paper." (pp. 481-482)

(1) For the consensus view, see Parsons [9], For the dissenting view, at least in regard to the extension of predicative second-order logic to ramified type theory, see Church [2].

It is possible of course that Church intends his demurral to apply only after predicates are ramified and allowed to occur as subjects of higher-order predicates. If so, then we believe that his demurral may have some merit (see Note 10).

(2) For reasons indicated in Note 10, we suspect that ramification may presuppose a linguistic capacity for introducing predicates that exceeds the proper limits of a nominalist theory of predication. Such a capacity does not exceed the limits of a closely related form of conceptualism (briefly discussed in Section 6) which may be represented by the nonstandard predicative second-order logic formulated in [3].

Reprinted as Chapter 1 in *Logical Studies in Early Analytic Philosophy*, pp. 19-63.

"The development of the theory of logical types in Russell’s early philosophy proceeds along a difficult and rather involuted path; and even the final product, the theory as adumbrated in

[*Principia Mathematica* = PM], remains unclear in its syntax and problematic in its semantics. Indeed, one might well be left with the impression that Russell himself, in the end, remained unsure of which parts of the different views he had held along the way are finally to be adopted.

In what follows, we shall attempt to describe and explain the development of Russell's early views, at least to the extent to which they are available in published form today, from the perspective of the development in those views of the notion of a logical subject. It is the development of this notion in Russell's early philosophy, we believe, that holds the key to many of the problems confronting Russell in the development of his theory of logical types and that led to the various, and sometimes conflicting, proposals that he made along the way.

It should be noted, however, that in referring to the development of the theory of logical types in Russell's early philosophy we have in mind only the views developed by Russell up to, but not subsequent to, the 1910—13 publication of the first edition of [PM]. The subsequent views developed by Russell from 1913—25, that is, between the first and second editions of [PM], and summarized to some extent in his introduction (and added appendices) to the second edition, constitute Russell's version of logical atomism. Except for some concluding remarks in the final section of this chapter, we delay our discussion of those views until chapter 5." (pp. 19-20 of the reprint)

5. ———. 1981. "Richard Montague and the Logical Analysis of Language." In *Contemporary Philosophy: A New Survey. Vol. 2: Philosophy of Language*, edited by Fløistad, Guttorm, 113-155. The Hague: Martinus Nijhoff.

   "Richard Montague was an exceptionally gifted logician who made important contributions in every field of inquiry upon which he wrote. His professional career was not only marked with brilliance and insight but it has become a classic example of the changing and developing philosophical views of logicians in general, especially during the 1960s and 70s, in regard to the form and content of natural language. We shall, in what

follows, attempt to characterize the general pattern of that development, at least to the extent that it is exemplified in the articles Montague wrote during the period in question.

The articles to which we shall especially direct our attention are: ‘Pragmatics’ [1]; ‘Pragmatics and Intensional Logic’ [2]; ‘On the Nature of Certain Philosophical Entities’ [3]; ‘English as a Formal Language’ [4]; ‘Universal Grammar’ [5]; and ‘The Proper Treatment of Quantification in Ordinary English’ [7].

Needless to say, but many of the ideas and insights developed in these papers Montague shared with other philosophers and logicians, some of whom were his own students at the times in question. Montague himself was meticulous in crediting others where credit was due, but for convenience we shall avoid duplicating such references here." (p. 113)

(…)

"Concluding Remarks

There are many other important features of Montague’s grammar for English and of his translation of English by means of that grammar into intensional logic that we cannot go into here. The highly intensional nature of his semantics, for example, provides not only a more direct analysis of the opacity of intensional verbs but also a more direct analysis of the opacity of infinitive phrases as well. And then there is his treatment of relative clauses and of attributive adjectives, which we have not touched upon at all.

In closing then, it will no doubt have crossed the reader’s mind that there may be some irony in the fact that Montague began his philosophical career as an extensionalist who took set theory as the proper theoretical framework for philosophy and as a formal-language philosopher who viewed the formalization of ordinary language as either impossible or extremely laborious, and in any case as certainly not philosophically rewarding. For the fact is that Montague has made important and philosophically innovative contributions toward a fully formalized syntax and semantics for natural language and that the semantics in question is most perspicuously described in

terms of an intensional logic that transcends set theory and that in effect constitutes a new theoretical framework for philosophy. If this is not a revolution, it is at least a form of progress in the logical analysis of language." (p. 155)

Reprinted as Chapter 3 in *Logical Studies in Early Analytic Philosophy*, pp. 119-151.

"Contemporary philosophy is in a rut, according to Terence Parsons in his recent book *Nonexistent Objects*, ([NO]), and it

is one that stems from the (post-1905) work of Bertrand Russell. The main characteristic of this “Russellian rut” ([NO], 1) is strict adherence to the thesis that being, or being something, amounts to being something that exists—or equivalently that ‘there is’ is to be equated with ‘there exists’ ([NO], 6). This view is now so well entrenched, according to Parsons, that it is a main stay of what he also calls the orthodox tradition.

Now the orthodox view is in a rut, according to Parsons, “because it’s a view in which most of us are so entrenched that it’s hard to see over the edges” ([NO], 1). Naturally, if we want “to look over the edge and see how things might be different” ([NO], 8), as any objective seeker of truth would, then “we need to encounter an actual theory about nonexistent objects” (ibid.). It is the construction and presentation of such a theory that is Parsons’s concern in *Nonexistent Objects*.

(...)

"Now we do not object to Parsons’s choice of Meinong’s theory here, nor for that matter to his elegant reconstruction and presentation of that theory. We do think, however, that a more balanced recognition of Russell’s overall view is called for and that perhaps the best way to make the Meinongian notion of a concrete object understandable to the orthodox tradition is to compare it with the general Russellian notion of a concrete individual, i.e., the Russellian notion of an individual that can exist but which might in fact not exist. Indeed, on the basis of the analysis and comparison we shall give here, it is our position that the Meinongian notion of a concrete object, at least as reconstructed by Parsons, is parasitic upon, though in a beneficent way, the Russellian notion of a concrete individual, existent or otherwise." "The trouble with modal logic, according to its critics, is quantification into modal contexts - i.e. *de re* modality. For on the basis of such quantification, it is claimed, essentialism ensues, and perhaps a bloated universe of *possibilia* as well. The essentialism is avoidable, these critics will agree, but only by turning to a Platonic realm of individual concepts whose existence is no less dubious or problematic than mere *possibilia*. Moreover, basing one's semantics on individual concepts, it is claimed, would in effect render all identity statements containing only proper names either necessarily true or necessarily false - i.e. there would then be no contingent identity statements containing only proper names.

None of these claims is true quite as it stands, however; and in what follows we shall attempt to separate the chaff from the grain by examining the semantics of (first-order) quantified modal logic in the context of different philosophical theories. Beginning with the primary semantics of logical necessity and the philosophical context of logical atomism, for example, we

will see that essentialism not only does not ensue but is actually rejected in that context by the validation of the modal thesis of anti-essentialism, and that in consequence all *de re* modalities are reducible to *de dicto* modalities.

(...)

Besides the Platonic view of intensionality, on the other hand, there is also a socio-biologically based conceptualist view according to which concepts are not independently existing Platonic forms but cognitive capacities or related structures of the human mind whose realization in thought is what informs a mental act with a predicable or referential nature. This view, it will be seen, provides an account in which there can be contingent identity statements, but not such as to depend on the coincidence of individual concepts in the platonic sense. Such a conceptualist view will also provide a philosophical foundation for quantified tense logic and paradigmatic analyses thereby of metaphysical modalities in terms of time and causation. The problem of the objective significance of the secondary semantics for the analyzed modalities, in other words, is completely resolved on the basis of the nature of time, local or cosmic. The related problem of a possible ontological commitment to *possibilia*, moreover, is in that case only the problem of how conceptualism can account for direct references to past or future objects." (pp. 235-236)

8. ———. 1985. "Two Lambda-Extensions of the Theory of Homogeneous Simple Types as a Second Order Logic." *Notre Dame Journal of Formal Logic* no. 26:377-407.

   Contents:

   0. Introduction 377; 1. HST* revisited 379; 2. An improved axiom set for HST* 380; 3. The grammar of HST* with lambda-abstracts 383; 4. The system lambda-HST* 384; 5. The system HST*lambda 386; 6. An extensional Fregean semantics for nominalized predicates 390; 7. The relative consistency of HST*-lambda + (Ext*) to lambda-HST* + (Ext*) 393; 8. An intensional Fregean semantics for nominalized predicates 395; 9. Identity versus indiscernibility in HST*-lambda 402; Notes 406; References 407.

Abstract: "Two second order logics with lambda-abstracts are formulated as counterparts to the theory of homogeneous simple types. Predicates can be nominalized and occur as abstract singular terms in these logics so that self-predication is meaningful in general and, in certain special cases, even provable. Extensional and intensional Fregean semantics in which nominalized predicates are assigned individuals as concept-correlates are formulated and the extensional and intensional versions of these logics are shown to be complete with respect to their corresponding semantics. The logics are also shown to be consistent relative to weak Zermelo set theory."

"In the theory of simple logical types as originally conceived, it is meaningless for one predicate expression to occur in one of the subject or argument positions of another unless the latter is assigned a higher logical type than the former within the grammar of the object language; and therefore it is meaningless in particular for any predicate expression to apply to itself, i.e., to occur in one of its own subject positions. Russell's paradox of predication is thereby avoided, of course, but the price is high, for the resulting theory is not an accurate representation of the role of predicates in natural language where predicate expressions can apply not only to the nominalizations of other predicates but to their own nominalizations as well -- and without regard at all for the notion of a logical type. In the theory of logical types as a second-order logic, on the other hand, predicate expressions are typed within the grammar of the object language only in the way they are typed in standard second-order logic, i.e., only with respect to their degree or number of subject positions, and they are allowed otherwise to meaningfully occur in the subject or argument positions of other predicates, and of themselves as well, without regard to the notion of a logical type. Russell's paradox of predication can be avoided, it turns out, not by resorting to the notion of a logical type as a part of the grammar of the object language but rather only as a part of the metalinguistic description of the conditions under which properties and relations are to be posited by means of the grammar of the object language. The

difference is crucial, needless to say, since it allows for a more accurate representation of the role of predicates and predication in natural language. The resulting theory is not, to be sure, a second-order logic in the "standard" sense used today (though it does contain the latter), but it is a second-order logic in the traditional or pre-type-theoretical sense in which quantifier expressions are allowed to reach into both subject and predicate positions without obliterating the logical and conceptually important distinctions between the two." (pp. 377-378)

9. ———. 1985. "Frege's Double Correlation Thesis and Quine's Set Theories NF and ML." *Journal of Philosophical Logic* no. 14:1-39.

   Reprinted as Chapter 4 in *Logical Studies in Early Analytic Philosophy*, pp. 152-192.

   "There are two fundamentally different notions of a class, which, following tradition, we might call the mathematical and the logical notions, respectively. The logical notion is essentially the notion of a class as the extension of a concept, and, following Frege, we shall assume that a class in this sense “simply has its being in the concept, not in the objects which belong to it” (Frege, [PW], 183)—regardless of whether or not concepts themselves differ, as Frege assumed, “only so far as their extensions are different” (ibid., 118). The mathematical notion of a class, on the other hand, is essentially the notion of a class as composed of its members, i.e., of a class that has its being in the objects that belong to it. This notion of a class, we claim, is none other than the iterative concept of set—or at least that is what it comes to upon analysis. Note that although what accounts for the being of a class under the one notion is not the same as what accounts for the being of a class under the other, nevertheless the axiom of extensionality applies equally to both notions. This means that the axiom of extensionality does not of itself account for the being of a class. (1)

   Of course the logical notion of a class, especially as developed in Frege’s form of logicism, is usually thought to be bankrupt as a result of Russell’s paradox. This assessment, however, is

erroneous. In particular, in “Frege, Russell, and Logicism: A Logical Reconstruction,” ([FRL]), I have explained how Frege’s view of classes in the logical sense can be reconstructed without paradox by modifying in either of two ways what I there referred to as Frege’s double correlation thesis. The two systems that result from these modifications, it turns out, have certain structural similarities with Quine’s two set theories NF and ML, especially when the latter are themselves modified so as to include urelements other than the empty set. This is significant because both NF and ML are commonly said to “lack a motivation” (cf. Boolos’s “The Iterative Concept of Set” ([ICS]), 219). But that is because as theories of sets in the sense of classes that are composed of their members, which is really the only sense to which Quine is willing to commit himself, both NF and ML are incompatible with the iterative concept of set. As theories of classes in the logical sense, however, and in particular of the classes that Frege took to be the correlates of concepts, both NF and ML can be given a very natural motivation, especially when modified to include urelements. In what follows we shall defend this motivation by examining the structural similarities in question." (pp. 152-153 of the reprint)

(1) In an intensional language, the mathematical notion of a class might well assume a stronger axiom of extensionality, viz. one in which classes that are composed of their members are necessarily identical when they have the same members. Such an axiom would not in general hold for classes in the logical sense, since co-extensive concepts are not in general necessarily co-extensive. (It would of course hold for those classes in the logical sense that are the extensions of “rigid” concepts, i.e., concepts that have the same extension in every possible world.)

10. ———. 1986. "Frege, Russell and Logicism: A Logical Reconstruction." In *Frege Synthesized: Essays on the Philosophical and Foundational Work of Gottlob Frege*, edited by Haaparanta, Leila and Hintikka, Jaakko, 197-252. Dordrecht: Reidel.

    Reprinted as Chapter 2 in *Logical Studies in Early Analytic Philosophy*, pp. 64-118.

    "Logicism by the end of the nineteenth century was a philosophical doctrine whose time had come, and it is Gottlob Frege to whom we owe its arrival. “Often,” Frege once wrote, “it is only after immense intellectual effort, which may have continued over centuries, that humanity at last succeeds in achieving knowledge of a concept in its pure form, in stripping off the irrelevant accretions which veil it from the eyes of the mind” (Frege, *The Foundations of Arithmetic,* [Fd], xix). Prior to Frege logicism was just such a concept whose pure form was obscured by irrelevant accretions; and in his life’s work it was Frege who first presented this concept to humanity in its pure form and developed it as a doctrine of the first rank.

    That form, unfortunately, has become obscured once again. For today, as we approach the end of the twentieth century, logicism, as a philosophical doctrine, is said to be dead, and even worse, to be impossible. Frege’s logicism, or the specific presentation he gave of it in *Die Grundgesetze der Arithmetik*, ([Gg]), fell to Russell’s paradox, and, we are told, it cannot be resurrected. Russell’s own subsequent form of logicism presented in [PM], moreover, in effect gives up the doctrine; for in overcoming his paradox, Russell was unable to reduce classical mathematics to logic without making at least two assumptions that are not logically true; namely, his assumption of the axiom of reducibility and his assumption of an axiom of infinity regarding the existence of infinitely many concrete or nonabstract individuals.

    Contrary to popular opinion, however, logicism is not dead beyond redemption; that is, if logicism is dead, then it can be easily resurrected. This is not to say that as philosophical doctrines go logicism is true, but only that it can be logically

reconstructed and defended or advocated in essentially the same philosophical context in which it was originally formulated. This is true especially of Frege's form of logicism, as we shall see, and in fact, by turning to his correspondence with Russell and his discussion of Russell's paradox, we are able to formulate not only one but two alternative reconstructions of his form of logicism, both of which are consistent (relative to weak Zermelo set theory).

In regard to Russell's form of logicism, on the other hand, our resurrection will not apply directly to the form he adopted in [PM] but rather to the form he was implicitly advocating in his correspondence with Frege shortly after the completion of [POM]. In this regard, though we shall have occasion to refer to certain features of his later form of logicism, especially in our concluding section where a counterpart to the axiom of reducibility comes into the picture, it is Russell's early form of logicism that we shall reconstruct and be concerned with here.

Though Frege's and Russell's early form of logicism are not the same, incidentally, they are closely related; and one of our goals will be to reconstruct or resurrect these forms with their similarity in mind. In particular, it is our contention that both are to be reconstructed as second order predicate logics in which nominalized predicates are allowed to occur as abstract singular terms. Their important differences, as we shall see, will then consist in the sort of object each takes nominalized predicates to denote and in whether the theory of predication upon which the laws of logic are to be based is to be extensional or intensional." (pp. 64-65 of the reprint)

11. ———. 1986. "Conceptualism, Ramified Logic, and Nominalized Predicates." *Topoi.An International Review of Philosophy* no. 5:75-87.

    "The problem of universals as the problem of what predicates stand for in meaningful assertions is discussed in contemporary philosophy mainly in terms of the opposing theories of nominalism and logical realism. Conceptualism, when it is mentioned, is usually identified with intuitionism, which is not a theory of predication but a theory of the activity of constructing proofs in mathematics. Both intuitionism and conceptualism are concerned with the notion of a mental construction, to be sure, and both maintain that there can only be a potentially infinite number of such constructions. But whereas the focus of concern in intuitionism is with the construction of proofs, in conceptualism our concern is with the construction of concepts. This difference sets the two frameworks apart and in pursuit of different goals, and in fact it is not at all clear how the notion of a mental construction in the one framework is related to that in the other. This is especially true insofar as mathematical objects, according to intuitionism, are nothing but mental constructions, whereas in conceptualism concepts are anything but objects. In any case, whatever the relation between the two, our concern in this paper is with conceptualism as a philosophical theory of predication and not with intuitionism as a philosophy of mathematics.

    Now conceptualism differs from nominalism insofar as it posits universals, namely, concepts, as the semantic grounds for the correct or incorrect application of predicate expressions. Conceptualism differs from logical realism, on the other hand, insofar as the universals it posits are not assumed to exist independently of the human capacity for thought and representation. Concepts, in other words, are neither predicate expressions nor independently real properties and relations. But then, at least for the kind of conceptualism we have in mind here, neither are they mental images or ideas in the sense of

particular mental occurrences. That is, concepts are not objects (saturated individuals) but are rather cognitive capacities, or cognitive structures otherwise based upon such capacities, to identify and classify or characterize and relate objects in various ways. Concepts, in other words, are intersubjectively realizable cognitive abilities which may be exercized by different persons at the same time as well as by the same person at different times. And it is for this reason that we speak of concepts as objective universals, even though they are not independently real properties and relations.

As cognitive structures, however, concepts in the sense intended here are not Fregean concepts (which for Frege are independently real unsaturated functions from objects to truth values). But they may be modeled by the latter (assuming that there are Fregean concepts to begin with) -especially since as cognitive capacities which need not be exercized at any given time (or even ever for that matter), concepts in the sense intended here also have an unsaturated nature corresponding to, albeit different from, the unsaturated nature of Fregean concepts. Thus, in particular, the saturation (or exercise) of a concept in the sense intended here results not in a truth value but a mental act, and, if overtly expressed, a speech act as well. The un-saturatedness of a concept consists in this regard in its non-occurrent or purely dispositional status as a cognitive capacity, and it is the exercise (or saturation) of this capacity as a cognitive structure which informs particular mental acts with a predicable nature (or with a referential nature in the case of concepts corresponding to quantifier expressions)." 14. ———. 1988. "Predication Versus Membership in the Distinction between Logic as Language and Logic as Calculus." *Synthese* no. 75:37-72.

Contents: 0. Introduction; 1. The problem with a set-theoretic semantics of natural language; 2. Intensional logic as a new theoretical framework for philosophy; 3.The incompleteness of intensional logic when based on membership; 4. Predication versus membership in type theory; 5. Second order predicate logic with nominalized predicates; 6. A set theoretic semantics with predication as fundamental; 7. Concluding remarks.

"There are two major doctrines regarding the nature of logic today. The first is the view of logic as the laws of valid inference, or logic as calculus. This view began with Aristotle's theory of the syllogism, or syllogistic logic, and in time evolved first into Boole's algebra of logic and then into quantificational logic. On this view, logic is an abstract calculus capable of various interpretations over domains of varying cardinality. Because these interpretations are given in terms of a set-theoretic semantics where one can vary the universe at will and consider the effect this, has on the validity of formulas, this view is sometimes described as the set-theoretic approach to logic (see van Heijenoort ["Logic as Language and Logic as Calculus", *Synthese* 17,] 1967, p. 327).

The second view of logic does not eschew set-theoretic semantics, it should be noted, and it may in fact utilize such a semantics as a guide in the determination of validity. But to use such a semantics as a guide, on this view, is not the same as to take that semantics as an essential characterization of validity. Indeed, unlike the view of logic as calculus, this view of logic rejects the claim that a set-theoretic definition of validity has anything other than an extrinsic significance that may be exploited for certain purposes (such as proving a completeness theorem). Instead, on this view, logic has content in its own right and validity is determined by what are called the laws of logic, which may be stated either as principles or as rules. Because one of the goals of this view is a specification of the basic laws of logic from which the others may be derived, this view is sometimes called the axiomatic approach to logic." (p. 37)

(...)

"Concluding Remarks. The account we have given here of the view of logic as language should not be taken as a rejection of the set-theoretical approach or as defense of the metaphysics of possibilist logical realism. Rather, our view is that there are really two types of conceptual framework corresponding to our two doctrines of the nature of logic. The first type of framework is based on membership in the sense of the iterative concept of set; although extensionality is its most natural context (since sets have their being in their members), it may nevertheless be extended to include intensional contexts by way of a theory of senses (as in Montague's sense-denotation intensional logic). The second type of framework is based on predication, and in particular developments it is associated with one or another theory of universals. Extensionality is not the most natural context in this theory, but where it does hold and extensions are posited, the extensions are classes in the logical and not in the mathematical sense.

Russell's paradox, as we have explained, has no real bearing on set-formation in a theory of membership based on the iterative concept of set, but it does bear directly on concept-formation or the positing or universals in a theory based on predication. As a result, our second type of framework has usually been thought to be incoherent or philosophically bankrupt, leaving us with the set-theoretical approach as, the only viable alternative. This is why so much of analytic philosophy in the 20th Century has been dominated by the set-theoretical approach. Set theory, after all, does seem to serve the purposes of a *mathesis universalis*.

What is adequate as a *mathesis universalis*, however, need not also therefore be adequate as a l*ingua philosophica* or *characteristica universalis*. In particular, the set-theoretic approach does not seem to provide a philosophically satisfying semantics for natural language; this is because it is predication and not membership that is fundamental to natural language. An adequate semantics for natural language, in other words, seems to demand a conceptual framework based on predication and not on membership.

(...)

We do not maintain, accordingly, that we should give up the set-theoretic approach, especially when dealing with the philosophy and foundations of mathematics, or that only a theory of predication associated with possibilist logical realism will provide an adequate semantics for natural language. In both cases we may find a principle of tolerance, if not outright pluralism, the more appropriate attitude to take." (pp. 69-70)

Contents: 1. Predication and the problem of universal 254; 2. Nominalism 256; 3. A nominalistic semantics for predicative second order logic 261; 4. Nominalism and modal logic 266; 5 . Conceptualism vs . nominalism 270; 6. Constructive conceptualism 273; 7. Ramification of constructive conceptualism 280; 8. Holistic conceptualism 286; 9. Logical realism vs holistic conceptualism 289; 10. Possibilism and actualism in modal logical realism 292; 11. Logical realism and cssentialism 301; 12. Possibilism and actualism within conceptualism 306; 13. Natural realism and conceptualism 313; 14. Aristotelian essentialism and the logic of natural kinds 318; References 325-326.

"Predication has been a central, if not the central, issue in philosophy since at least the lime of Plato and Aristotle. Different theories of predication have in fact been the basis of a number of philosophical controversies in both metaphysics and epistemology, not the least of which is the problem of universals. In what follows we shall be concerned with what traditionally have been the three most important types of theories of universals. namely, nominalism, conceptualism, and realism, and with the theories of predication which these theories might be said to determine or characterize.

Though each of these three types of theories of universals may be said to have many variants, we shall ignore their differences here to the extent that they do not characterize different

theories of predication. This will apply especially to nominalism where but one formal theory of predication is involved. In both conceptualism and realism, however, the different variants of each type do not all agree and form two distinct subtypes each with its own theory of predication. For this reason we shall distinguish between a constructive and a holistic form of conceptualism on the one hand, and a logical and a natural realism on the other. Constructive conceptualism, as we shall see, has affinities with nominalism with which it is sometimes confused, and holistic conceptualism has affinities with logical realism with which it is also sometimes confused. Both forms of conceptualism may assume some form of natural realism as their causal ground; and natural realism in turn must presuppose some form of conceptualism as its background theory of predication. Both forms of realism may be further divided into their essentialist and non-essentialist variants (and in logical realism even a form of anti-essentialism), and though an essentialist logical realism is sometimes confused with Aristotelian essentialism, the latter is really a form of natural realism with natural kinds as the only essential properties objects can have." (pp. 253-254)

16. ———. 1989. "Russell's Theory of Logical Types and the Atomistic Hierarchy of Sentences." In *Rereading Russell: Essays on Bertrand Russell's Metaphysics and Epistemology*, edited by Savage, C.Wade and Anderson, C.Anthony, 41-62. Minneapolis: University of Minnesota Press.

    Reprinted as Chapter 5 in *Logical Studies in Early Analytic Philosophy*, pp. 193-221.

    "Russell’s philosophical views underwent a number of changes throughout his life, and it is not always well-appreciated that views he held at one time came later to be rejected; nor, similarly, that views he rejected at one time came later to be accepted. It is not well-known, for example, that the theory of logical types Russell described in his later or post-[PM] philosophy is not the same as the theory originally described in [PM] in 1910-13; nor that some of the more important applications that Russell made of the theory at the earlier time cannot be validated or even significantly made in the

framework of his later theory. What is somewhat surprising, however, is that Russell himself seems not to have realized that he was describing a new theory of logical types in his later philosophy, and that as a result of the change some of his earlier logical constructions, including especially his construction of the different kinds of numbers, were no longer available to him.

In the original framework, for example, propositional functions are independently real properties and relations that can themselves have properties and relations of a higher order/type, and all talk of classes, and thereby ultimately of numbers, can be reduced to extensional talk of properties and relations as "single entities," or what Russell in [POM] had called "logical subjects." The Platonic reality of classes and numbers was replaced in this way by a more fundamental Platonic reality of propositional functions as properties and relations. In Russell's later philosophy, however, "a propositional function is nothing but an expression. It does not, by itself, represent anything. But it can form part of a sentence which does say something, true or false" (Russell, *My Philosophical Development*, ([MPD]), 69). Surprisingly. Russell even insists that this was what he meant by a propositional function in [PM]. "Whitehead and I thought of a propositional function as an expression containing an undetermined variable and becoming an ordinary sentence as soon as a value is assigned to the variable: 'x is human', for example, becomes an ordinary sentence as soon as we substitute a proper name for V. In this view . . . the propositional function is a method of making a bundle of such sentences" ([MPD], 124). Russell does realize that some sort of change has come about, however, for he admits, "I no longer think that the laws of logic are laws of things; on the contrary, I now regard them as purely linguistic" (ibid., 102).

(...)

Now it is not whether [PM] can sustain a nominalistic interpretation that is our concern in this essay, as we have said, but rather how it is that Russell came to be committed in his

later philosophy to the atomistic hierarchy and the nominalistic interpretation of propositional functions as expressions generated in a ramified second order hierarchy of languages based on the atomistic hierarchy. We shall pursue this question by beginning with a discussion of the difference between Russell's 1908 theory of types and that presented in [PM] in 1910. This will be followed by a brief summary of the ontology that Russell took to be implicit in [PM], and that he described in various publications between 1910 and 1913. The central notion in this initial discussion is what Russell in his early philosophy called the notion of a logical subject, or equivalently that of a "term" or "single entity". (In [PM], this notion was redescribed as the systematically ambiguous notion of an "object.") As explained in chapter 1 this notion provides the key to the various problems that led Russell in his early philosophy to the development of his different theories of types, including that presented in [PM]. This remains true, moreover, even when we turn to Russell's later philosophy, i.e., to his post-[PM] views, only then it is described as the notion of what can and cannot be named in a logically perfect language. The ontology of these later views is what Russell called logical atomism, and it is this ontology that determines what Russell described as the atomistic hierarchy of sentences. In other words, it is the notion of what can and cannot be named in the atomistic hierarchy that explains how Russell, however unwittingly, came to replace his earlier theory of logical types by the theory underlying the atomistic hierarchy of sentences as the basis of a logically perfect language." (pp. 193-195 of the reprint)

"0. Introduction

Linguists and philosophers are sometimes at odds in the semantical analysis of language. This is because linguists tend to assume that language must be semantically analyzed in terms of mental constructs, whereas philosophers tend to assume that only a platonic realm of intensional entities will suffice. The problem for the linguist in this conflict is how to explain the apparent realist posits we seem to be committed to in our use of language, and in particular in our use of infinitives, gerunds and other forms of nominalized predicates. The problem for the philosopher is the old and familiar one of how we can have knowledge of independently real abstract entities if all knowledge must ultimately be grounded in psychological states and processes. In the case of numbers, for example, this is the problem of how mathematical knowledge is possible. In the case of the intensional entities assumed in the semantical analysis of language, it is the problem of how knowledge of even our own native language is possible, and in particular of how we can think and talk to one another in all the ways that language makes possible.

I believe that the most natural framework in which this conflict is to be resolved and which is to serve as the semantical basis of natural language is an intensional logic that is based upon a conceptual analysis of predication in which what a predicate stands for in its role as a predicate is distinguished from what its nominalization denotes in its role as a singular term. Predicates in such a framework stand for concepts as cognitive

capacities to characterize and relate objects in various ways, i.e. for dispositional cognitive structures that do not themselves have an individual nature, and which therefore cannot be the objects denoted by predicate nominalizations as abstract singular terms. The objects purportedly denoted by nominalized predicates, on the other hand, are intensional entities, e.g. properties and relations (and propositions in the case of zero-place predicates), which have their own abstract form of individuality, which, though real, is posited only through the concepts that predicates stand for in their role as predicates. That is, intensional objects are represented in this logic as concept-correlates, where the correlation is based on a logical projection of the content of the concepts whose correlates they are.

(…)

Before proceeding, however, there is an important distinction regarding the notion of a logical form that needs to be made when joining conceptualism and realism in this way. This is that logical forms can be perspicuous in either of two senses, one stronger than the other. The first is the usual sense that applies to all theories of logical form, conceptualist or otherwise; namely, that logical forms are perspicuous in the way they specify the truth conditions of assertions in terms of the recursive operations of logical syntax. In this sense, fully applied logical forms are said to be semantic structures in their own right. In the second and stronger sense, logical forms may be perspicuous not only in the way they specify the truth conditions of an assertion, but in the way they specify the cognitive structure of that assertion as well. To be perspicuous in this sense, a logical form must provide an appropriate representation of both the referential and the predicable concepts that underlie an assertion.

Our basic hypothesis in this regard will be that every basic assertion is the result of applying just one referential concept and one predicable concept, and that such an applied predicable concept is always fully intensionalized (in a sense to be explained). This will place certain constraints on the

conditions for when a complex predicate expression is perspicuous in the stronger sense — such as that a referential expression can occur in such a predicate expression only in its nominalized form. (A similar constraint will also apply to a defining or restricting relative clause of a referential expression.) In the cases where a relational predicable concept is applied, the assumption that there is still but one referential concept involved leads to the notion of a conjunctive referential concept, a notion that requires the introduction in intensional logic of special quantifiers that bind more than one individual variable. Except for briefly noting the need for their development, we shall not deal with conjunctive quantifiers in this essay." (pp. 15-16)

18. ———. 1991. "Conceptualism." In *Handbook of Metaphysics and Ontology*, edited by Smith, Barry and Burkhardt, Hans, 168-174. Munich: Philosophia Verlag.

    Conceptualism is one of the three types of theories regarding the nature of universals described by Porphyry in his introduction to Aristotle's Categories. The other two are nominalism and realism. Because a universal, according to Aristotle, is that which can be predicated of things (De Int. 17a39), the difference between these three types of theories lies in what it is that each takes to be predicable of things. In this regard we should distinguish predication in language from predication in thought, and both from predication in reality, where there is no presumption that one kind of predication precludes the others.

    All three types of theories agree that there is predication in language, in particular that predicates can be predicated of things in the sense of being true or false of them. Nominalism goes further in maintaining that only predicates can be predicated of things, that is, that there are no universals other than the predicate expressions of some language or other. Conceptualism opposes nominalism in this regard and maintains that predicates can be true or false of things only because they stand for concepts, where concepts are the universals that are the basis of predication in thought. Realism also opposes nominalism in maintaining that there are real

universals, viz. properties and relations, that are the basis of predication in reality." (p. 168)

(...)

"Conceptualism is by no means a monolithic theory, but has many forms, some more restrictive than others, depending on the mechanisms assumed as the basis for concept-formation. None of these forms, in themselves, precludes being combined with a realist theory, whether Aristotelian (as in conceptual natural realism) or Platonist (as in conceptual intensional realism), or both. Some conceptualists, such as Sellars, have made it a point to disassociate conceptualism from any form of realism regarding abstract entities, but that disassociation has nothing to do with conceptualism as a theory about the nature of predication in thought. Conceptualism's shift in emphasis from metaphysics to psychology, in other words, while important in determining what kind of theory is needed to explain predication in thought, should not be taken as justifying a restrictive form of conceptualism that precludes both a natural and an intensional realism." (p. 174)

19. ———. 1991. "Logic V: Higher Order Logics." In *Handbook of Metaphysics and Ontology*, edited by Smith, Barry and Burkhardt, Hans, 466-470. Munich: Philosophia Verlag.

"Higher-order logic goes beyond first-order logic in allowing quantifiers to reach into the predicate as as well as the subject positions of the logical forms it generates. A second feature, usually excluded in standard formulations of second-order logic, allows nominal-ized forms of predicate expressions (simple or complex) to occur in its logical forms as abstract singular terms. (E.g., 'Socrates is wise', in symbols W(s), contains 'is wise' as a predicate, whereas 'Wisdom is a virtue', in symbols V(W), contains 'wisdom' as a nominalized form of that predicate. 'Being a property is a property', in symbols P(P), or with λ-abstracts, PλxP(x)), where λχP(χ) is read 'to be an x such that x is a property', contains both the predicate 'is a property' and a nominalized form of that predicate, viz. 'being a property'. Frege's well-known example, 'The concept Horse is

not a concept', contains 'the concept Horse' as a nominalized form of the predicate phrase 'is a horse'.)" (p. 466)

20. ———. 1991. "Ontology, Fomal." In *Handbook of Metaphysics and Ontology*, edited by Smith, Barry and Burkhardt, Hans, 640-647. Munich: Philosophia Verlag.

    "Formal ontology is the result of combining the intuitive, informal method of classical ontology with the formal, mathematical method of modern symbolic logic, and ultimately identifying them as different aspects of one and the same science. That is, where the method of ontology is the intuitive study of the fundamental properties. modes, and aspects of being, or of entities in general, and the method of modern symbolic logic is the rigorous construction of formal, axiomatic systems, formal ontology, the result of combining these two methods, is the systematic, formal, axiomatic development of the logic of all forms and modes of being. As such, formal ontology is a science prior to all others in which particular forms, modes, or kinds of being are studied." (p. 641)

21. ———. 1991. "Russell, Bertrand." In *Handbook of Metaphysics and Ontology*, edited by Smith, Barry and Burkhardt, Hans, 796-798. Munich: Philosophia Verlag.

    "Russell held a number of different metaphysical positions throughout his career, with the idea of logic as a logically perfect language being a common theme that ran through each.

    (...)

    "A fundamental notion of Russell's logical realism, sometimes also called ontological logicism, was that of a propositional function, the extension of which Russell took to be a class as many. Initially, as part of his response to the problem of the One and the Many, Russell had assumed that each propositional function was a single and separate entity over and above the many propositions that were its values, and, similarly, that to each class as many there corresponded a class as one. Upon discovering his paradox, Russell maintained that we must distinguish a class as many from a class as one, and that a class as one might not exist corresponding to a class as

many. He also concluded that a propositional function cannot survive analysis after all, but 'lives' only in the propositions that are its values, i.e. that propositional functions are nonentities."

(...)

"As a result of arguments given by Ludwig Wittgenstein in 1913, Russell, from 1914 on, gave up the Platonistic view that properties and relations could be logical subjects. Predicates were still taken as standing for properties and relations, but only in their role as predicates; i.e., nominalized predicates were no longer allowed as abstract singular terms in Russell's new version of his logically perfect language. Only particulars could be named in Russell's new metaphysical theory, which he called logical atomism, but which, unlike his earlier 1910-13 theory, is a form of natural realism, and not of logical realism, since now the only real properties and relations of his ontology are the simple material properties and relations that are the components of the atomic facts that make up the world. Complex properties and relations in this framework are simply propositional functions, which, along with propositions, are now merely linguistic expressions. (Russell remained unaware that as a result of the change in his metaphysical views from logical to natural realism his original theory of types was restricted to the much weaker sub-theory of ramified second-order logic, and that he could no longer carry through his logicist programme. This reinforced the confusion of nominalists into thinking that Russell's earlier theory of types could be given a nominalistic interpretation, since such an interpretation is possible for ramified second-order logic.)" (pp. 797-798)

22. ———. 1991. "Quantification, Time and Necessity." In *Philosophical Applications of Free Logic*, edited by Lambert, Karel, 242-256. New York: Oxford University Press.

    Contents: 0. Introduction; 1. A Logic a Actual and Possible Objects; 2. A Completeness Theorem for Tense Logic; 3. Modality Within Tense Logic; 4. Some Observations on Quantifiers in Modal and Tense Logic; 5. Concluding Remarks.

Abstract: "A logic of actual and possible objects is formulated in which "existence" and "being", as second-level concepts represented by first-order (objectual) quantifiers, are distinguished. A free logic of actual objects is then distinguished as a subsystem of the logic of actual and possible object. Several complete first-order tense logics are then formulated in which temporal versions of possibilism and actualism are characterized in terms of the free logic of actual objects and the wide logic of actual and possible objects. It is then shown how a number of different modal logics can be interpreted within quantified tense logic, with the latter providing a paradigmatic framework in which to distinguish the interplay between quantifiers, tenses and modal operators and within which we can formulate different temporal versions of actualism and possibilism."

"The fundamental assumption of a logic of actual and possible objects is that the concept of existence is not the same as the concept of being. Thus, even though necessarily whatever exists has being, it is not necessary in such a logic that whatever has being exists; that is, it can be the case that there be something that does not exist. No occult doctrine is needed to explain the distinction between existence and being, for an obvious explanation is already at hand in a framework of tense logic in which being encompasses past, present, and future objects (or even just past and present objects) while existence encompasses only those objects that presently exist. We can interpret modality in such a framework, in other words, whereby it can be true to say that some things do not exist. Indeed, as indicated in Section 3, infinitely many different modal logics can be interpreted in the framework of tense logic. In this regard, we maintain, tense logic provides a paradigmatic framework in which possibilism (i.e., the view that existence is not the same as being, and that therefore there can be some things that do not exist) can be given a logically perspicuous representation.

Tense logic also provides a paradigmatic framework for actualism as the view that is opposed to possibilism; that is, the view that denies that the concept of existence is different from

the concept of being. Indeed, as we understand it here, actualism does not deny that there can be names that have had denotations in the past but that are now denotationless, and hence that the statement that some things do not exist can be true in a semantic metalinguistic sense (as a statement about the denotations, or lack of denotations, of singular terms). What is needed, according to actualism, is not that we should distinguish the concept of existence from the concept of being, but only that we should modify the way that the concept of existence (being) is represented in standard first-order predicate logic (with identity). A first-order logic of existence should allow for the possibility that some of our singular terms might fail to denote an existent object, which, according to actualism, is only to say that those singular terms are denotationless rather than what they denote are objects (beings) that do not exist. Such a logic for actualism amounts to what nowadays is called free logic." (pp. 242-243)

23. ———. 1992. "Conceptual Realism Versus Quine on Classes and Higher-Order Logic." *Synthese* no. 90:379-436.

    Contents: 0. Introduction; 1. Predication versus Membership; 2. Old versus New Foundations; 3. Concepts versus ultimate Classes; 4. Frege versus Quine on Higher-Order Logic; 5. Conceptualism versus Nominalism as Formal Theories of predication; 6. Conceptualism Ramified versus Nominalism Ramified; 7. Constructive Conceptual Realism versus Quine's view of Conceptualism as a Ramified Theory of Classes; 8. Holistic Conceptual Realism versus Quine's Class Platonism.

    Abstract: "The problematic features of Quine's 'set' theories NF and ML are a result of his replacing the higher-order predicate logic of type theory by a first-order logic of membership, and can be resolved by returning to a second-order logic of predication with nominalized predicates as abstract singular terms. We adopt a modified Fregean position called conceptual realism in which the concepts (unsaturated cognitive structures) that predicates stand for are distinguished from the extensions (or intensions) that their nominalizations denote as singular terms. We argue against Quine's view that predicate quantifiers can be given a referential interpretation only if the

entities predicates stand for on such an interpretation are the same as the classes (assuming extensionality) that nominalized predicates denote as singular terms. Quine's alternative of giving predicate quantifiers only a substitutional interpretation is compared with a constructive version of conceptual realism, which with a logic of nominalized predicates is compared with Quine's description of conceptualism as a ramified theory of classes. We argue against Quine's implicit assumption that conceptualism cannot account for impredicative concept-formation and compare holistic conceptual realism with Quine's class Platonism."

"According to Quine, in one of his later works, the pioneers in modern logic, such as Frege and Russell, overestimated the kinship between membership and predication and in that way came to view set theory as logic (Quine 1970, p. 65). Such a claim, we maintain, is both false and misleading. Frege and Russell did assume a logical kinship between predication and membership, but what they meant by membership was membership in a class as the extension of a concept (where a concept is a predicable entity, i.e., a universal in the traditional sense) and not membership in a set. Sets, unlike classes, as we have said, have their being in their members, and in that regard there need be no kinship at all between predication and membership in a set. Classes in the logical sense, on the other hand, have their being in the concepts whose extensions they are, which means that any theory of membership in a class presupposes a superseding theory of predication. (3) Frege and Russell did not view set theory as logic, but they each did develop a theory

of classes and they each did so based on a superseding higher-order theory of predication." (p. 382)

24. ———. 1992. "Cantor's Power-Set Theorem Versus Frege's Double-Correlation Thesis." *History and Philosophy of Logic* no. 13:179-201.

Abstract: "Frege’s thesis that second-level concepts can be correlated with first-level concepts and that the latter can be correlated with their value-ranges is in direct conflict with

Cantor's power-set theorem, which is a necessary part of the iterative, but not of the logical, concept of class. Two consistent second-order logics with nominalised predicates as abstract singular terms are described in which Frege's thesis and the logical notion of a class are defended and Cantor's theorem is rejected. Cantor's theorem is not incompatible with the logical notion of class, however. Two alternative similar kinds of logics are also described in which Cantor's theorem and the logical notion of a class are retained and Frege's thesis is rejected."

"There is another problem with Russell's solution, however, in addition to that of the relativisation of classes to each logical type. This problem has to do with the fact that the particular theory of types that Russell adopted is a theory of ramified types, which, unlike the theory of simple types, is based on a constructive (i.e. 'predicative') comprehension principle. Such a constructive approach is not without merit, but it does affect the logical notion of a class in a fundamental way. In particular, because of the kind of constructive constraints imposed by the theory on the comprehension principle, Cantor's theorem, which involves objects of different types, cannot be proved in such a framework (cf. Quine 1963, 265). That is not objectionable in itself, but it does not get at the root of the matter of the real conflict between Cantor's power-set theorem and the logical notion of class as represented by an impredicative comprehension principle.

An impredicative comprehension principle is provable in the theory of simple types. But in this framework, as in the theory of ramified types as well, Russell's paradox cannot even be stated (because of the gramatical constraints on the conditions of well-formedness), which means that the description of the class upon which Russell's paradox is based is meaningless. Thus, not only must the universal class be relativised and duplicated, potentially, infinitely many times in order to avoid Russell's paradox on this approach, but the paradox must itself be ruled as meaningless. The theory of types, whether simple or ramified, is not really a solution of the problem so much as a way of avoiding it altogether.

There is another way in which we can preserve our logical intuitions and not give up the logical notion of a class in favor of the mathematical (i.e. in favor of set theory), and yet in which not only is Cantor's theorem formulable but so is Russell's paradox—though, of course, the latter will no longer be provable. Indeed, there is not just one such way, but at least two (both of which themselves have two alternatives). On the first, it is not the logical notion of a class that must be rejected as the way of resolving Russell's paradox, but Cantor's theorem instead. This rejection is not ad hoc or arbitrary on this approach, but is based on a more general principle, which we refer to as Frege's double-correlation thesis. It is this approach that we shall turn to first. On the second and alternative approach, which we shall turn to later, the trouble lies in neither Cantor's theorem nor in the assumption that there is a universal class (both of which can be retained without contradiction on this approach), but rather in how the logic of identity is to be applied in certain contexts. On this approach, the claim that a contradiction results by combining Cantor's theorem with the assumption that the universal class exists is not a 'truism' after all but is outright false."

Annotated bibliography of Nino Cocchiarella 1993-2019

Essays 1993-2019

1. Cocchiarella, Nino. 1993. "On Classes and Higher-Order Logic: A Critique of W.V.O. Quine." *Philosophy and the History of Science.A Taiwanese Journal* no. 2:23-50.

   Abstract: "The problematic features of Quine's set theories NF and ML result from compressing the higher-order predicate logic of type theory into a first-order logic of membership, and can be resolved by turning to a second-order predicate logic with nominalized predicates as abstract singular terms. A modified Fregean position, called conceptual realism, is described in which the concepts (unsaturated cognitive structures) that predicates stand for are distinguished from the extensions (or intensions) that their nominalizations denote as abstract singular terms. Quine's view that conceptualism cannot account for impredicative concept-formation is rejected, and a holistic conceptual realism is compared with Quine's class Platonism."

2. ———. 1995. "Knowledge Representation in Conceptual Realism." *International Journal of Human-Computer Studies* no. 43:697-721.

   "Knowledge representation in Artificial Intelligence (AI) involves more than the representation of a large number of facts or beliefs regarding a given domain, i.e. more than a mere listing of those facts or beliefs as data structures. It may involve, for example, an account of the way the properties and

relations that are known or believed to hold of the objects in that domain are organized into a theoretical whole - such as the way different branches of mathematics, or of physics and chemistry, or of biology and psychology, etc., are organized, and even the way different parts of our commonsense knowledge or beliefs about the world can be organized. But different theoretical accounts will apply to different domains, and one of the questions that arises here is whether or not there are categorial principles of representation and organization that apply across all domains regardless of the specific nature of the objects in those domains. If there are such principles, then they can serve as a basis for a general framework of knowledge representation independently of its application to particular domains. In what follows I will give a brief outline of some of the categorial structures of conceptual realism as a formal ontology. It is this system that I propose we adopt as the basis of a categorial framework for knowledge representation." (p. 697)

(...)

" Concluding remarks. We have given here only an overview or sketch of conceptual realism as a formal ontology, i.e. as a theory of logical form having both conceptual and ontological categories - but in which the latter are represented in terms of the former. The categories of natural kinds and of natural properties and relations, for example, are represented in terms of the categories of sortals and predicable concepts, respectively, and the category of abstract objects is represented in terms of the process of conceptual nominalization (reification) as a subcategory of objects. Not all of these categories or parts of this formal ontology will be relevant in every domain of knowledge representation, but each is relevant at least to some domains and is needed in a comprehensive framework for knowledge representation. In those domains where certain categorial distinctions are not needed - such as that between predicative and impredicative concepts, or that between predicable concepts and natural properties and relations, or between sortal concepts and natural kinds, etc. - we can simply ignore or delete the logical forms in question.

What must remain as the core of the system is the intensional logic around which all of the other categories are built - namely, the second-order predicate logic with nominalized predicates as abstract singular terms that we call HST*-lambda. It is this core, I believe, that can serve as a universal standard by which to evaluate other representational systems." (p. 721)

3. ———. 1996. "Conceptual Realism as a Formal Ontology." In *Formal Ontology*, edited by Poli, Roberto and Simons, Peter, 27-60. Dordrecht: Kluwer.

   Contents: 1. Introduction; 2. Substitutional versus Ontological Interpretations of Quantifiers; 3. The Importance of the Notion of Unsaturedness in Formal Ontology; 4. Referential and Predicable Concepts Versus Immanent Objects of Reference; 5. Conceptual Natural Realism and the Analogy of Being Between Natural and Intelligible Universals; 6. Conceptual Natural Realism and Aristotelian Essentialism; 7. Conceptual Intensional Realism versus Conceptual Platonism and the Logic of Nominalized Predicates

   8. Concluding Remarks.

   Abstract: "Conceptualism *simpliciter*, wheter constructive or holistic, provides an account of predication only in thought and language, and represents in that regard only a truncated formal ontology. But conceptualism can be extended to an Aristotelian conceptual natural realism in which natural properties and relations (and natural kinds as well) can be analogically posited corresponding to some of Our concepts, thereby providing an account of predication in the space-time causal Order as well. In addition, through a pattern of reflexive abstraction corresponding to the process of nominalization in language (and in which abstract objects are hypostatized corresponding to our concepts as unsaturated cognitive structures), conceptualism can also be extended to a conceptual Platonism or intensional realism that can provide an account of both the intensional objects of fiction and the extensional objects of mathematics. Conceptual realism is thus shown to be a paradigm formal ontology in which the distinctions between abstract reality, natural reality, and thought and language are

properly represented, and in which the traditional opposition between Platonism and Aristotelianism is finally overcome by properly locating their different functions, and the way each should be rep resented, in formal ontology."

"Concluding Remarks. As this informal sketch indicates, conceptual realism, by which we mean conceptual natural realism and conceptual intensional realism together, provides the basis of a general conceptual-ontological framework, within which, beginning with thought and language, a comprehensive formal ontology can be developed. Not only does conceptual realism explain how, in naturalistic terms, predication in thought and language is possible, but, in addition, it provides a theory of the nature of predication in reality through an analogical theory of properties and relations. In this way, conceptual realism can be developed into a reconstructed version of Aristotelian realism, including a version of Aristotelian essentialism. In addition, through the process of nominalization, which corresponds to a reflexive abstraction in which we attempt to represent our concepts as if they were objects, conceptualism can be developed into a conceptual intensional realism that can provide an account not only of the abstract reality of numbers and other mathematical objects, but of the intensional objects of fiction and stories of all kinds, both true and false, and including those stories that we systematically develop into theories about the world. In this way, conceptual realism provides a framework not only for the conceptual and natural order, but for the mathematical and intensional order as well. Also, in this way, conceptual realism is able to reconcile and provide a unified account both of Platonism and Aristotelian realism, including Aristotelian essentialism - and it does so by showing how the ontological categories, or modes of being, of each of these ontologies can be explained in terms a conceptualist theory of predication and its analogical extensions." (p. 60)

4. ———. 1997. "Formally Oriented Work in the Philosophy of Language." In *Routledge History of Philosophy. Vol. X - The Philosophy of Meaning, Knowledge and Value in the 20th Century*, edited by Canfield, John, 39-75. New York: Routledge.

Contents: 1. The notion of a Characteristica Universalis as a philosophical language; 2. The notion a a logically perfect language as a regulating ideal; 3. The theory of logical types; 4. Radical empiricism and the logical construction of the world; 5. The logical empiricist theory of meaning; 6. Semiotic and the trinity of syntax, semantics and pragmatics; 7. Pragmatics from a logical point of view; 8. Intensional logic; 9. Universal Montague grammar; 10. Speech-act theory and the return to pragmatics.

Abstract: "One of the perennial issues in philosophy is the nature of the various relationships between language and reality, language and thought, and language and knowledge. Part of this issue is the question of the kind of methodology that is to be brought to bear on the study of these relationships. The methodology that we shall discuss here is based on a formally oriented approach to the philosophy of language, and specifically on the notion of a logically ideal language as the basis of a theory of meaning and a theory of knowledge."

5. ———. 1997. "Conceptual Realism as a Theory of Logical Form." *Revue Internationale de Philosophie*:175-199.

"The central notion in the philosophy of logic is the notion of a logical form, and the central issue is which theory of logical form best represents our scientific (including our mathematical) and commonsense understanding of the world. Here, by a theory of logical

form, we mean not only a logical grammar in the sense of a system of formation rules characterizing the well-formed expressions of the theory, but also a logical calculus characterizing what is valid (i.e., provable or derivable) in the theory. The representational role of the logical forms of such a theory consists in the fact that they are perspicuous in the way they specify the truth conditions, and thereby the validity, of formulas in terms of the recursive operations of logical syntax. In conceptualism we also require that logical forms be perspicuous in the way they represent the cognitive structure of our speech and mental acts, including in particular the referential and predicable concepts underlying those acts.

The purpose of a theory of logical form, accordingly, is that it is to serve as a general semantical framework by which we can represent in a logically perspicuous way our commonsense and scientific understanding of the world, including our understanding of ourselves

and the cognitive structure of our speech and mental acts. So understood, the logical forms of such a theory are taken to be semantic structures in their own right, relative to which the words, phrases, and (declarative) sentences of a (fragment of) natural language, or of a scientific or mathematical theory, are to be represented and interpreted. The process by which the expressions of a natural language or scientific theory are represented and interpreted in such a theory — relative to the aims, purposes and pragmatic considerations regarding a given context or domain of discourse — amounts to a logical analysis of those expressions. (A different group of aims, purposes, etc., might give a finer- or a coarser-grained analysis of the domain.)

Ideally, where the syntax of a target language or theory has been recursively characterized, such an analysis can be given in terms of a precisely characterized theory of translation (1). Usually, however, the analysis is given informally.

In what follows I will briefly describe and attempt to motivate some (but not all) aspects of a theory of logical form that I associate with the philosophical system I call conceptual realism. The realism involved here is really of two types, one a natural realism (amounting to a modem form of Aristotelian essentialism) and the other an intensional realism (amounting to a modem, but also mitigated, form of Platonism). The core of the theory is a second-order logic in which predicate expressions (both simple and complex) can be nominalized and treated as abstract singular terms (in the sense of being substituends of individual variables). In this respect the core is really a form of conceptual intensional realism, which is the only part of the system we will discuss here (2)." (pp. 175-176)

(1) See Montague (1969) for a description of such a theory of translation (for Montague's type-theoretical intensional logic).

(2) See Cocchiarella (1996), §§ 5-6, for a description of conceptual natural realism as a modem form of Aristotelian Essentialism.

6. ———. 1998. "Property Theory." In *Routledge Encyclopedia of Philosophy - Vol. 7*, edited by Craig, Edward, 761-767. New York: Routledge.

Abstract: "Traditionally, a property theory is a theory of abstract entities that can be predicated of things. A theory of properties in this sense is a theory of predication -just as a theory of classes or sets is a theory of membership. In a formal theory of predication, properties are taken to correspond to some (or all) one-place predicate expressions. In addition to properties, it is usually assumed that there are n-ary relations that correspond to some (or all) n-place predicate expressions (for n > 2). A theory of properties is then also a theory of relations.

In this entry we shall use the traditional labels 'realism' and 'conceptualism' as a convenient way to classify theories. In natural realism, where properties and relations are the physical, or natural, causal structures involved in the laws of nature, properties and relations correspond to only some predicate expressions, whereas in logical realism properties and relations are generally assumed to correspond to all predicate expressions.

Not all theories of predication take properties and relations to be the universals that predicates stand for in their role as predicates. The universals of conceptual ism, for example. are unsaturated concepts in the sense of cognitive capacities that are exercised (saturated) in thought and speech. Properties and

relations in the sense of intensional Platonic objects may still correspond to predicate expressions, as they do in conceptual intensional realism, but only indirectly as the intensional contents of the concepts that predicates stand for in their role as predicates. In that case, instead of properties and relations being what predicates stand for directly, they are what nominalized predicates denote as abstract singular terms. It is in this way that concepts - such as those that the predicate phrases 'is wise', 'is triangular' and 'is identical with' stand for - are distinguished from the properties and relations that are their intensional contents - such as those that are denoted by the abstract singular terms 'wisdom', 'triangularity' and 'identity, respectively. Once properties are represented by abstract singular terms, concepts can be predicated of them, and, in particular, a concept can be predicated of the property that is its intensional content. For example, the concept represented by 'is a property' can be predicated of the property denoted by the abstract noun phrase 'being a property', so that 'being a property is a property' (or, 'The property of being a property is a property') becomes well-formed. In this way, however, we are confronted with Russell's paradox of (the property of) being a non-self-predicable property, which is the intensional content of the concept represented by ' is a non-self-predicable property'. That is, the property of being a non-self- predicable property both falls and does not fall under the concept of being a non-self-predicable property (and therefore both falls and does not fall under the concept of being self-predicable)." (p. 761)

7. ———. 1998. "The Theory of Types (Simple and Ramified)." In *Routledge Encyclopedia of Philosophy - Vol. 9*, edited by Craig, Edward, 359-362. New York: Routledge.

   Abstract: "The theory of types was first described by Bertrand Russell in 1908. He was seeking a logical theory that could serve as a framework for mathematics and, in particular, a theory that would avoid the so-called 'vicious-circle' antinomies, such as his own paradox of the property of those properties that are not properties of themselves - or, similarly, of the class of those classes that are not members of themselves.

Such paradoxes can be thought of as resulting when logical distinctions are not made between different types of entities and, in particular, between different types of properties and relations that might be predicated of entities, such as the distinction between concrete objects and their properties, and the properties of those properties, and so on. In 'ramified' type theory, the hierarchy of properties and relations is, as it were, two-dimensional, where properties and relations are distinguished first by their order, and the by their level within each order. In 'simple' type theory properties and relations are distinguished only by their orders." (p. 359)

8. ———. 1998. "Reference in Conceptual Realism." *Synthese* no. 114:169-202.

   Contents: 1. The core of Conceptual Intensional Realism; 2. Referential concepts, simple and complex; 3. Geach's negation and complex predicate arguments; 4. Active versus deactivated referential concepts; 5. Deactivation and Geach's arguments; 6. Relative pronouns and referential concepts; 7. Relative pronouns as referential expressions; 8. Concluding remarks.

   Abstract: "A conceptual theory of the referential and predicable concepts used in basic speech and mental acts is described in which singular and general, complex and simple, and pronominal and non-pronominal, referential concepts are given a uniform account. The theory includes an intensional realism in which the intensional contents of predicable and referential concepts are represented through nominalized forms of the predicate and quantifier phrases that stand for those concepts. A central part of the theory distinguishes between active and deactivated referential concepts, where the latter are represented by nominalized quantifier phrases that occur as parts of complex predicates. Peter Geach's arguments against theories of general reference in "Reference and Generality" are used as a foil to test the adequacy of the theory. Geach's arguments are shown to either beg the question of general as opposed to singular reference or to be inapplicable because of the distinction between active and deactivated referential concepts."

"Concluding Remarks. We do not claim that the theory of relative pronouns as referential expressions proposed in Section 7 is unproblematic, it should be noted. If it should turn out that it cannot be sustained, then we still have the theory proposed in Section 6, where relative pronouns are taken as anaphoric proxies for non-pronominal referential expressions. In other words, whether the proposal of Section 7 is sustained or not, we maintain that Geach's arguments against complex names and general reference do not work against the kind of conceptualist theory we have presented here.

We also do not claim to have proved that our conceptualist theory of reference resolves all problems about reference, but only that it has passed an initial test of adequacy as far as Geach's arguments in (Geach Reference and Generality third edition, 1980) are concerned. It is our view that a conceptualist theory is what is needed to account for reference and predication in our speech and mental acts, and that only a theory of the referential and predicable concepts that underlie the basic forms of such acts will suffice. Such a theory, we maintain, must provide a uniform account of general as well as singular reference, and, in terms of the referential and predicable concepts involved in a speech or mental act, it must distinguish the logical forms that represent the cognitive structure of that act from the logical forms that only represent its truth conditions. That, in any case, is the kind of conceptualist theory we have attempted to describe and defend here." (p. 198)

10. ———. 2000. "Russell's Paradox of the Totality of Propositions." *Nordic Journal of Philosophical Logic* no. 5:25-37.

    Abstract: "Russell’s “new contradiction” about “the totality of propositions” has been connected with a number of modal paradoxes. M. Oksanen has recently shown how these modal

paradoxes are resolved in the set theory NFU. Russell's paradox of the totality of propositions was left unexplained, however. We reconstruct Russell's argument and explain how it is resolved in two intensional logics that are equiconsistent with NFU. We also show how different notions of possible worlds are represented in these intensional logics."

"In Appendix B of his 1903 *Principles of Mathematics* (PoM), Russell described a "new contradiction" about "the totality of propositions" that his "doctrine of types" (as described in Appendix B) was unable to avoid. (1)

In recent years this "new contradiction" has been connected with a number of modal paradoxes, some purporting to show that there cannot be a totality of true propositions, (2) or that even the idea of quantifying over the totality of propositions leads to contradiction. (3) A number of these claims have been discussed recently by Mika Oksanen and shown to be spurious relative to the set theory known as NFU. (4) In other words, if NFU is used instead of ZF as the semantical metalanguage for modal logic, the various "paradoxes" about the totality of propositions (usually construed as the totality of sets of possible worlds) can be seen to fail (generally because of the existence of a universal set and the failure of the general form of Cantor's power-set theorem in NFU). It is not clear, however, how Russell's own paradox about the totality of propositions is resolved on this analysis, and although Oksanen quoted Russell's description of the paradox in detail, he did not show how it is explained in NFU after his resolution of the other related modal paradoxes; in fact, it is not at all clear how this might be done in NFU.

One reason why Russell's argument is difficult to reconstruct in NFU is that it is based on the logic of propositions, and implicitly in that regard on a theory of predication rather than a theory of membership. A more appropriate medium for the resolution of these paradoxes, in other words, would be a formal theory of predication that is a counterpart to NFU.

Fortunately, there are two such theories, λHST* and HST*λ, that are equiconsistent with NFU and that share with it many of

the features that make it a useful framework within which to resolve a number of paradoxes, modal or otherwise. (5)" (pp. 25-26)

11. ———. 2001. "A Logical Reconstruction of Medieval Terminist Logic in Conceptual Realism." *Logical Analysis and History of Philosophy* no. 4:35-72.

Abstract: "The framework of conceptual realism provides a logically ideal language within which to reconstruct the medieval terminist logic of the 14th century. The terminist notion of a concept, which shifted from Ockham's early view of a concept as an intentional object (the *fitcum* theory) to his later view of a concept as a mental act (the *intellectio* theory), is reconstructed in this framework in terms of the idea of concepts as unsaturated cognitive structures. Intentional objects (*ficta*) are not rejected but are reconstructed as the objetified intensional contents of concepts. Their reconstruction as intensional objects is an essential part of the theory of predication of conceptual realism. It is by means of this theory that we are able to explain how the identity theory of the copula, which was basic to terminist logic, applies to categorical propositions. Reference in conceptual realism is not the same as supposition in terminist logic. Nevertheless, the various "modes" of personal supposition of terminist logic can be explained and justified in terms of this conceptualist theory of reference."

"Conclusion. The framework of conceptual realism provides a logically ideal language within which to reconstruct the medieval terminist logic of the 14th century. The terminist notion of a concept, which shifted from Ockham’s early view of a concept as an intentional object (the f*ictum* theory) to his later view of a concept as a mental act (the *intellectio* theory), is reconstructed in this framework in terms of the notion of a concept as an unsaturated cognitive structure. Referential and predicable concepts in particular are unsaturated cognitive structures that mutually saturate each other in mental acts,

analogous to the way that quantifier phrases and predicate expressions mutually saturate each other in language. Intentional objects (*ficta*) are not rejected but are reconstructed as the objectified intensional contents of concepts, i.e., as intentional objects obtained through the process of nominalization — and in that sense as products of the evolution of language and thought. Their reconstruction as intensional objects is an essential part of the theory of predication of conceptual realism. In particular, the truth conditions determined by predicable concepts based on relations — including the relation the copula stands for — are characterized in part in terms of these objectified intensional contents. It is by means of this conceptualist theory of predication that we are able to explain how the identity theory of the copula, which was basic to terminist logic, applies to categorical propositions.

Reference in conceptual realism, based on the exercise and mutual saturation of referential and predicable concepts, is not the same as supposition in terminist logic. Nevertheless, the various "modes" or types of personal supposition are accounted for in a natural and intuitive way in terms of the theory of reference of conceptual realism. Ockham's application of merely confused supposition to common names occurring within the scope of an intensional verb is rejected, as it should be, but its rejection is grounded on the notion of a deactivated referential concept—a deactification that, because of the intensionality of the context in question, cannot be "activated," the way it can be in extensional contexts." (p. 71)

12. ———. 2001. "Logic and Ontology." *Axiomathes.An International Journal in Ontology and Cognitive Systems* no. 12:127-150.

    Contents: 1. Logic as Language versus Logic as Calculus; 2. Predication versus Membership; 3. The vagaries of Nominalism; 4. The Vindication (Almost) of Logical Realism; 5. Conceptualism Without a Transcendental Subject; 6. Conceptual Natural realism and the Analogy of being Between Natural and Conceptual Universals; 7. Conceptual Intensional Realism; 8. Concluding Remarks.

Abstract: "A brief review of the historical relation between logic and ontology and of the opposition between the views of logic as language and logic as calculus is given. We argue that predication is more fundamental than membership and that different theories of

predication are based on different theories of universals, the three most important being nominalism, conceptualism, and realism. These theories can be formulated as formal ontologies, each with its own logic, and compared with one another in terms of their respective explanatory powers. After a brief survey of such a comparison, we argue that an extended form of conceptual realism provides the most coherent formal ontology and, as such, can be used to defend the view of logic as language."

"Concluding Remarks: Despite our extended discussion and defense of conceptual realism, the fact remains that this is a formal ontology that can be described and compared with other formal ontologies in the set-theoretic framework of comparative formal ontology. Set theory, as we have said, provides a convenient mathematical medium in which both the syntax and an extrinsic semantics of different formal ontologies can be formulated, which then can be compared and contrasted with one another in their logical and descriptive powers. This is the real insight behind the view of logic as calculus. But membership is at best a pale shadow of predication, which underlies thought, language and the different categories of reality. Set theory is not itself an adequate framework for general ontology, in other words, unless based on a theory of predication (as in Quine's nominalist-platonism). Only a formal theory of predication based on a theory of universals can be the basis of a general ontology. This is the real insight behind the view of logic as language. But there are alternative theories of universals, and therefore alternative formal theories of predication, each with its own logic and theory of logical form. A rational choice can be made only by formulating and comparing these alternatives in comparative formal ontology, a program that can best be carried out in set theory. Among the various alternatives that have been formulated and investigated

over the years, the choice we have made here, for the reasons given, is what we have briefly described above as conceptual realism, which includes both a conceptual natural realism and a conceptual intensional realism. Others may make a different choice. As Rudolf Carnap once said: "Everyone is at liberty to build up his own logic, i.e. his own form of language, as he wishes." But then, at least in the construction of a formal ontology, we all have an obligation to defend our choice and to give reasons why we think one system is better than another. In this regard, we do not accept Carnap's additional injunction that in logic, there are no morals." (pp. 145-146)

13. ———. 2001. "A Conceptualist Interpretation of Leśniewski's Ontology." *History and Philosophy of Logic* no. 22:29-43.

Contents: 1. Introduction 29; 2. Leśniewski's Ontology as a First-Order Theory 29; 3. The Logic of Names in Conceptual Realism 31; 4. A Conceptualist Interpretation of Leśniewski's System 35; 5. Reduction of Leśniewski's Theory of Definitions 39; 6. Consistency and Decidability 40; References 43.

Abstract: "A first-order formulation of Leśniewski's ontology is formulated and shown to be interpretable within a free first-order logic of identity extended to include nominal quantification over proper and common-name concepts. The latter theory is then shown to be interpretable in monadic second-order predicate logic, which shows that the first-order part of Leśniewski's ontology is decidable."

"Introduction. One of the important applications of Leśniewski's system of ontology, sometimes also called *the logic of (proper and common) names*, (1) has been as a logistic framework that can be used in the reconstruction of medieval terminist logic. (2) This is especially so because the basic relation of Leśniewski's system, singular inclusion, amounts to a version of the two-name theory of the copula. (3) An alternative reconstruction of medieval terminist logic can also be given within the logistic framework of conceptual

realism, however.(4) This system is preferable in part because, unlike Leśniewski's ontology, it is not committed to an extensional framework, which is important in the logical analysis of the tensed and modal modification (ampliation) of the terms (names) of medieval logic. (5) It is also possible, as we show below, to reduce or reconstruct Leśniewski's ontology within the logistic framework of conceptual realism."

(1) See, e.g. Lejewski 1958, p. 152, Slupecki 1955 and Iwanuś 1973.

(2) See, e.g. Henry 1972.

(3) Singular inclusion, as represented by e in the formula 'a e b', read as 'a is b', was the only undefined constant of Leśniewski's original system of ontology. The system could also be based either on partial, weak of strong inclusion as the only primitive as well. See Lejewski 1958, pp. 154-156.

(4) See Cocchiarella 2001. For an account of conceptual realism as a formal ontology see Cocchiarella 1996.

(5) One might, of course, add tense and modal operators to Leśniewski's ontology, even though he himself was against such a move.

14. ———. 2002. "On the Logic of Classes as Many." *Studia Logica* no. 70:303-338.

Abstract: "The notion of a “class as many” was central to Bertrand Russell’s early form of logicism in his 1903 *Foundations of Mathematics*. There is no empty class in this sense, and the singleton of an urelement (or atom in our reconstruction) is identical with that urelement. Also, classes with more than one member are merely pluralities— or what are sometimes called “plural objects”— and cannot as such be themselves members of classes. Russell did not formally develop this notion of a class but used it only informally. In what follows, we give a formal, logical reconstruction of the logic of classes as many as pluralities (or plural objects) within a fragment of the framework of conceptual realism. We also take groups to be classes as many with two or more members and show how groups provide a semantics for plural quantifier phrases."

"There is a notion of a class that has been ignored by most, but not all, philosophers. (4) This is the notion of a “ class as many,” as described, e.g., by Bertrand Russell in his 1903 Principles of Mathematics. (5) A class in this sense is the extension of a common count noun, i.e., the extension of what traditionally has been called a common name. (6) The three important features of this notion are, first, that a vacuous common name, i.e., a common name that names nothing, has no extension, which is not the same as having an

empty class as its extension. Thus, according to Russell, “there is no such thing as the null class, though there are null class-concepts,” i.e., commonname concepts that have no extension. (7) Secondly, the extension of a common name that names just one thing (in the sense of an urelement) is just that one thing. In other words, unlike the singleton sets of set theory, which

are not identical with their single member, the class that is the extension of a common name that names just one thing (urelement) is none other than that one thing."

(...)

"We believe that this notion of a class, or of a group, can be usefully developed as part of the broader framework of conceptual realism that we have described elsewhere. (11)" (pp. 304-305)

(4) See, e.g., Simons 1982 for one proposed formulation of this notion. Simons's formulation is different from the one we give here. Simons doubts that there can be "an exact logic for the quantificatory uses" of common names, which is what the present system is

based on. Also, whereas the present system relies on only one type of "objectual" variable (having both "atoms" and classes as many as values), Simons has three: one for "individuals," another for "pluralities," and a third for "neutrals." There are a number of other

differences as well, but we will not go into them here.

(5) See Russell 1903, chapter VI. Russell's view in this book precedes his later no-classes doctrine.

(6) Strictly speaking, Russell distinguishes between a common name, e.g., 'man', and its plural form, 'men', and then takes the latter to denote the class as many of men (§67). We do not distinguish common names from their plural forms here, and we describe the class as many simply as the extension of the common name (and the concept it stands for).

15. ———. 2002. "Logical Necessity Based on Carnap's Criterion of Adequacy." *Korean Journal of Logic* no. 5:1-21.

Abstract: "A semantics for logical necessity, based on Carnap's criterion of adequacy, is given with respect to the ontology of logical atomism. A calculus for sentential (propositional) modal logic is described and shown to be complete with respect to this semantics. The semantics is then modified in terms of a restricted notion of 'all possible worlds'in the interpretation of necessity and shown to yield a completeness theorem for the modal logic S5. Such a restricted notion introduces material content into the meaning of necessity so that, in addition to atomic facts, there are "modal facts" that distinguish one world from another."

"...in what follows we will construct a semantics for logical necessity based on Rudolf Carnap's criterion of adequacy and the metaphysical framework of logical atomism, a semantics, we maintain, that provides a clear and precise account of the connection between logical truth and logical necessity— at least with respect to this kind of metaphysical framework. (4)" (p. 2)

(4) There are reasons to think that no other sort of metaphysical framework can succeed in adequately explaining the connection between logical truth and logical necessity. This is not to say, however, that other frameworks cannot account for notions of necessity other than logical necessity.

16. ———. 2003. "Conceptual Realism and the Nexus of Predication." *Metalogicon* no. 16:45-70.

Abstract: "The nexus of predication is accounted for in different ways in different theories of universals. We briefly review the

account given in nominalism, logical realism (modern Platonism), and natural realism. Our main goal is to describe the account given in a modern form of conceptualism extended to include a theory of intensional objects as the contents of our predicable and referential concepts."

"Introduction. A universal, according to Aristotle, is what can be predicated of things. (1) But what exactly do we mean in saying that a universal can be predicated of things? How, or in what way, do universals function in the nexus of predication?

In the history of philosophy, there are three major types of theories that deal with the problem of universals and that purport to answer these questions: (2)

(1) Nominalism: According to this theory there are no universals, and there is predication only in language; that is, only predicates can be predicated of things, and the only nexus of predication is the linguistic nexus between subject and predicate expressions.

(2) Realism: There are real universals, i.e., universals in reality, that are predicated of things, and the function of predication in language is to represent predication in reality. Different versions of realism explain the nexus of predication in reality in different ways.

(3) Conceptualism: There are conceptual universals, e.g., predicable concepts, that underlie predication in thought, and the nexus of predication in thought underlies the nexus of predication in language.

All three theories agree that there is predication in language though each has a different account of how that kind of predication is possible and what it represents. The theory we will describe here in some detail is a modern form of conceptualism.

Unlike traditional conceptualism (e.g., British empiricism), the conceptualism we describe here is not based on a theory of “ideas” (*Vorstellungen*), and it includes an intensional realism

based on an evolutionary account of concept-formation. In this paper, our main

purpose is to describe the conceptualist account of the nexus of predication.

Before turning to conceptualism, we will make some brief observations about nominalism and realism and our methodology." (pp. 45-46)

17. ———. 2005. "Denoting Concepts, Reference, and the Logic of Names, Classes as Many, Groups and Plurals." *Linguistics and Philosophy* no. 28:135-179.

Abstract: "Bertrand Russell introduced several novel ideas in his 1903 *Principles of Mathematics* that he later gave up and never went back to in his subsequent work. Two of these are the related notions of denoting concepts and classes as many. In this paper we reconstruct each of these notions in the framework of conceptual realism and connect them through a logic of names that encompasses both proper and common names, and among the latter complex as well as simple common names. Names, proper or common, and simple or complex, occur as parts of quantifier phrases, which in conceptual realism stand for referential concepts, i.e., cognitive capacities that inform our speech and mental acts with a referential nature and account for the intentionality, or directedness, of those acts. In Russell's theory, quantifier phrases express denoting concepts (which do not include proper names). In conceptual realism, names, as well as predicates, can be nominalized and allowed to occur as "singular terms", i.e., as arguments of predicates. Occurring as a singular term, a name denotes, if it denotes at all, a class as many, where, as in Russell's theory, a class as many of one object is identical with that one object, and a class as many of more than one object is a plurality, i.e., a plural object that we call a group. Also, as in Russell's theory, there is no empty class

as many. When nominalized, proper names function as "singular terms" just the way they do in so-called free logic. Leśniewski's ontology, which is also called a logic of names can be completely interpreted within this conceptualist framework, and the well-known oddities of Leśniewski's system are shown not to be odd at all when his system is so interpreted. Finally, we show how the pluralities, or groups, of the logic of classes as many can be used as the semantic basis of plural reference and predication. We explain in this way Russell's "fundamental doctrine upon which all rests," i.e., "the doctrine that the subject of a proposition may be plural, and that such plural subjects are what is meant by classes [as many] which have more than one term" ([*Principles of Mathematics*], p. 517)."

"Bertrand Russell introduced several novel ideas in his 1903 *Principles of Mathematics* [PoM] that he later gave up and never went back to in his subsequent work. Two of these are the related notions of denoting concepts and classes as many. Russell explicitly rejected denoting concepts in his 1905 paper, "On Denoting". Although his reasons for doing so are still a matter of some debate, they depend in part on his assumption that all concepts, including denoting concepts, are objects and can be denoted as such. (1) Classes of any kind were later eliminated as part of Russell's "no-classes" doctrine, according to which all mention of classes was to be contextually analyzed in terms of reference to either propositions, as in Russell's 1905 substitution theory, or propositional functions as in *Principia Mathematica* [PM]. The problem with classes, as Russell and Whitehead described it in [PM], is that "if there is such an object as a class, it must be in some sense one object. Yet it is only of classes that many can be predicated. Hence, if we admit classes as objects, we must suppose that the same object can be both one and many, which seems impossible" (p. 72).

Both notions are worthy of reconsideration, however, even if only in a somewhat different, alternative form in a conceptualist framework that Russell did not himself adopt. In such a framework, which we will briefly describe here, Russell's assumption that all concepts are objects will be rejected in favor of a conceptualist counterpart to Frege's notion of

unsaturatedness, and we will reconsider the idea of a class as many somehow being both one and many." (pp. 135-136)

18. ———. 2008. "Infinity in Ontology and Mind." *Axiomathes.An International Journal in Ontology and Cognitive Systems* no. 18:1-24.

Abstract: "Two fundamental categories of any ontology are the category of objects and the category of universals. We discuss the question whether either of these categories can be infinite or not. In the category of objects, the subcategory of physical objects is examined within the context of different cosmological theories regarding the different kinds of fundamental objects in the universe.

objects are discussed in terms of sets and the intensional objects of conceptual realism. The category of universals is discussed in terms of the three major theories of universals: nominalism, realism, and conceptualism. The finitude of mind pertains only to conceptualism. We consider the question of whether or not this finitude precludes impredicative concept formation. An explication of potential infinity, especially as applied to concepts and expressions, is given. We also briefly discuss a logic of plural objects, or groups of single objects (individuals), which is based on Bertrand Russell's (1903, *The Principles of Mathematics*, 2nd edn. (1938). Norton & Co, NY) notion of a class as many. The universal class as many does not exist in this logic if there are two or more single objects; but the issue is undecided if there is just one individual. We note that adding plural objects (groups) to an ontology with a countable infinity of individuals (single objects) does not generate an uncountable infinity of classes as many."

"Introduction.

Ontology, as originally described by Aristotle, is the study of being qua being, where being is not univocal but is divided into different categories. The two most fundamental categories are those of universals and objects respectively. Here, by a universal, and again we follow Aristotle, we mean that which can be predicated of things.1 Predication, of course, is what connects universals with objects. One important aspect of the

role, or significance, of infinity in ontology, accordingly, is whether or not either of these categories, i.e., the category of objects or the category of universals, is, or can be, infinite. How infinity applies to mind in this regard is the question of whether or not there are, or can be, infinitely many concepts as intelligible universals, and whether or not the finitude of the human mind places limitations on the concepts that can be constructed.

The methodology of ontology, which, as we have said, is divided into different categories, is the analysis of those categories and the laws connecting them with one another, including in particular the nature of predication. The clearest and most precise way to analyze these categories is through the development of what is known as formal ontology, where the logico-grammatical forms and principles of a logistic system are formulated for the purpose of representing the different categories and the laws connecting them.2 A formal ontology in which ontological and logical categories are combined in a unified framework will then amount to a comprehensive deductive framework that is prior to all others in both logical and ontological structure. By proving the consistency of such a logistic system we can thereby show that the intuitive ontological framework associated with it is consistent as well.

One important role of infinity in ontology, accordingly, can be understood as the determination of whether or not any of the categories of being, and in particular the categories of objects and universals, are, or can be, infinite as part of such a formal framework. In what follows we will consider some possible answers to this question." (p. 2)

19. ———. 2009. "Mass Nouns in a Logic of Classes as Many." *Journal of Philosophical Logic* no. 38:343-361.

Abstract: "A semantic analysis of mass nouns is given in terms of a logic of classes as many. In previous work it was shown that plural reference and predication for count nouns can be interpreted within this logic of classes as many in terms of the subclasses of the classes that are the extensions of those count nouns. A brief review of that account of plurals is given here and it is then shown how the same kind of interpretation can also be given for mass nouns."

"Why is the semantics of mass nouns so problematic? One reason, apparently, is that unlike count nouns, which have determinate extensions, mass nouns have extensions that in some cases are said to be indeterminate. The objects in the extension of a count noun are unproblematic because those objects are generally discrete and well-delineated, and hence can be individuated. The objects in the extension of a mass noun, especially mass nouns for different kinds of stuff, are said to be “diffuse” and indeterminate, on the other hand, because there are often an indefinite number of ways to refer them separately as well as together as wholes. (1)

A number of proposals have been made and criticized about the extensions of mass nouns. (2) We will not review those proposals and criticisms here but instead will present a proposal of our own based on what has been called “the simplest plan” of all. (3) We will defend this “plan” in terms of a logical framework designed to represent a form of conceptualism in which the logical forms that represent the cognitive structure of our speech and mental acts are distinguished from the logical forms that represent the truth conditions and deductive relations of those acts." (pp. 343-344)

20. ———. 2009. "Reply to Gregory Landini's Review of *Formal Ontology and Conceptual Realism*." *Axiomathes.An International Journal in Ontology and Cognitive Systems*:143-153.

"1. Some Initial Ontological Distinctions.

In our discussion of Greg Landini's review, we should distinguish how the logical systems *lHST** and *HST*l* that I have developed are to be understood in my reconstructions of Gottlob Frege's and Bertrand Russell's *Principles of mathematics* (1903) ontologies as opposed to how *HST*l* is understood as a (proper) part of my ontology of conceptual realism. Both of these systems are type-free second-order predicate logics that allow predicate expressions (complex or simple) and formulas (propositional forms) to be nominalized and occur in formulas as abstract singular terms.(1)

The main logical difference between these systems, as Landini notes, is that whereas *lHST** contains standard first-order logic (with identity) as a proper part, the system *HST*l* is free of existential presuppositions regarding singular terms, including nominalized predicates as abstract singular terms, which is essential to any argument for Russell's paradox of predication. In particular, nominalization of the Russell predicate that is not predicable of itself turns out to be denotationless in *HST*l* as an abstract singular term.

The main ontological difference between Russell's and Frege's ontologies is that one is intensional and the other is extensional. Russell's (1903) ontology is based on predication as the ontological nexus of propositions, whereas Frege's is based on predication as a function from properties and relations to truth values. (2) In conceptual realism, predication is based on the mutual saturation of referential and predicable concepts as unsaturated complementary cognitive structures, the result being a speech or mental act. (3)

In Russell's ontology, a nominalized predicate denotes, as an abstract singular term, the very same property or relation (in-intension) that the predicate stands for in its role as a predicate. In Frege's ontology, a nominalized predicate denotes the extension (value range, *Wertverläufe*) of the concept or relation (*qua* function from objects to truth values) that the predicate stands for in predicate position; and in conceptual realism, a nominalized predicate denotes the intension of the concept (*qua* cognitive structure) that the predicate stands for in its role as a predicate. Because what a predicate stands for and what its nominalization denotes are not the same type of entity in either Frege's ontology or my conceptual realism, the fact that a nominalized predicate, on pain of contradiction, might fail to denote as an abstract singular term does not affect the objective reality of what that predicate stands for in its role as a predicate.

That is why the system *HST*l* can be used in a reconstruction of Frege's ontology as well as in my conceptual realism. The system *lHST** will also suffice for a reconstruction of Frege's ontology, but a free first-order predicate logic is essential to my analysis of plurals and mass nouns in terms of the logic of classes as many developed in my book, which means that only *HST*l* is appropriate for conceptual realism.

On the other hand, for a reconstruction of Russell's ontology, where nominalized predicates denote the same property or relation they stand for in their role as predicates, only the system *lHST** is appropriate. That is, because it is the same entity involved in both roles in Russell's ontology, we cannot in

that framework both affirm the being of what a predicate stands for in its role as a predicate, and also deny that being in the nominalization of the predicate as an abstract singular term." (p. 143)

(1) There is of course a type distinction between object terms and predicates in these systems; but unlike the situation in type theory there is no hierarchy of predicates of different types.

(2) Frege's *Begriffe* are really *Eigenshaften*, and in our in present context where we want to distinguish concepts as cognitive capacities from Frege's *Begriffe*, it is better to speak of his B*egriffe* as properties instead.

(3) We assume in this discussion a distinction between predication in language, predication in our speech and mental acts, and predication as the nexus of propositions or of states of affairs, or, in Frege's case, as functional application.

21. ———. 2009. "Reply to Andriy Vasylchenko's Review of *Formal Ontology and Conceptual Realism*." *Axiomathes.An International Journal in Ontology and Cognitive Systems*:167-178.

"Adriy Vasylchenko makes the interesting observation that our references are frequently emotionally charged. A comprehensive theory of reference, Vasylchenko suggests, should include an account of this phenomenon. We agree.

Indeed, as we will see, the theory of reference in conceptual realism can be used to explain an important feature of our emotional states when we read a novel, or watch a play, a movie, or even when viewing a painting. This feature, which in aesthetics is called psychical distance, is connected in part with the difference between active and deactivated reference in conceptual realism. We will take up that issue at the end this reply.

There is, however, an important misunderstanding in Vasylchenko's review of how the notion of existential presupposition applies -- or, as he claims, fails to apply -- to fictional objects and more generally to the abstract intensional objects of conceptual realism. We will discuss this latter issue

first, and then turn to the issue of our emotional states and psychical distance when reading fiction or watching a play or a film, and perhaps even when having an aesthetic experience in general." (p. 167)

23. ———. 2010. "Actualism versus Possibilism in Formal Ontology." In *Theory and Applications of Ontology. Vol. 1: Philosophical Perspectives*, edited by Poli, Roberto and Seibt, Johanna, 105-118. Dordrecht: Springer.

    "Comparative formal ontology is the study of how different informal ontologies can be formalized and compared with one another in their overall adequacy as explanatory frameworks. One important criterion of adequacy of course is consistency, a condition that can be satisfied only by formalization. Formalization also makes explicit the commitments of an ontology.

    There are other important criteria of adequacy as well, however, in addition to consistency and transparency of ontological commitment. One major such criterion is that a formal ontology must explain and provide an ontological ground for the distinction between being and existence, or, if the distinction is rejected, an adequate account of why it is rejected. Put simply, the problem is: Can there be things that do not exist? Or is being the same as existence? Different formal ontologies will answer these questions in different ways.

    The simplest account of the distinction between being and existence is that between actualism and possibilism, where by existence we mean physical existence, i.e., existence as some type of physical object; and by being we mean possible physical existence, i.e., physical existence in some possible world. According to possibilism, there are objects that do not now exist but could exist in the physical universe, and hence being is

not the same as existence. In actualism being is the same as existence.

Possibilism: There are objects (i.e., objects that have being or) that possibly exist but that do not in fact exist.

Therefore: Existence ≠ Being.

Actualism: Everything that is (has being) exists.

Therefore: Existence = Being.

Now the implicit understanding in formal ontology of both possibilism and actualism is that the objects that the quantifier phrases in these statements range over are values of the variables bound by the first-order quantifiers ∀and ∃(for the universal and existential quantifiers, respectively), and hence that what has being (on the level of objects) is a value of the (object) variables bound by these quantifiers. In other words, to be (an object, or thing) in both actualism and possibilism is to be a value of the bound object variables of first-order logic. This means that in possibilism, where being is not the same as existence, existence must be represented either by different quantifiers or by a predicate, e.g., E!, which is the predicate usually chosen for this purpose.

Another criterion of adequacy for a formal ontology is that it must explain the ontological grounds, or nature, of modality, i.e., of such modal notions as necessity and possibility, and in particular the meaning of possible physical existence. If the modalities in question are strictly formal, on the other hand, as is the case with logical necessity and possibility, then it must explain the basis of that formality.

This criterion cannot be satisfied by a set-theoretic semantics alone, especially one that allows for arbitrary sets of possible worlds (models) and so-called accessibility relations between those worlds. Such a semantics may be useful for showing the consistency of a modal logic, or perhaps even as a guide to our intuitions in showing its completeness; but it does not of itself provide an ontological ground for modality, or, in the case of

logical modalities, explain why those modalities are strictly formal.

We restrict our considerations here to how physical existence, both actual and possible, is represented in a formal ontology. This does not mean that the formal ontologies considered here cannot be extended so as to include an account of how abstract objects might be represented as well, if allowed at all." (pp. 105-106)

24. ———. 2010. "Predication in Conceptual Realism." *Axiomathes* no. 20:1-21.

    Abstract: "Conceptual realism begins with a conceptualist theory of the nexus of predication in our speech and mental acts, a theory that explains the unity of those acts in terms of their referential and predicable aspects. This theory also contains as an integral part an intensional realism based on predicate nominalization and a reflexive abstraction in which the intensional contents of our concepts are "object"-ified, and by which an analysis of predication with intensional verbs can be given. Through a second nominalization of the common names that are part of conceptual realism's theory of reference (*via* quantifier phrases), the theory also accounts for both plural reference and predication and mass noun reference and predication. Finally, a separate nexus of predication based on natural kinds and the natural properties and relations nomologically related to those natural kinds, is also an integral part of the framework of conceptual realism."

25. ———. 2013. "Representing Intentional Objects in Conceptual Realism." *Humana.Mente* no. 25:1-24.

    Special number edited by Laura Mari (Scuola Normale Superiore of Pisa) and Michele Paolini Paoletti (University of Macerata): *Meinong Strikes Again. Return to Impossible Objects 100 Years Later*.

    Abstract: "In this paper we explain how the intentional objects of our mental states can be represented by the intensional objects of conceptual realism. We first briefly examine and show how Brentano's actualist theory of judgment and his

notion of an immanent object have a clear and natural representation in our conceptualist logic of names. We then briefly critically examine Meinong's theory of objects before turning finally to our own representation of intentional objects in terms of the intensional objects of conceptual realism. We conclude by explaining why existence-entailing concepts are so basic to our commonsense framework and how these concepts and their intensions can be used to model Meinong's ontology."

26. ———. 2015. "Two Views of the Logic of Plurals and a Reduction of One to the Other." *Studia Logica* no. 103:757-780.

    Abstract: "There are different views of the logic of plurals that are now in circulation, two of which we will compare in this paper. One of these is based on a two-place relation of *being among*, as in 'Peter is among the juveniles arrested'. This approach seems to be the one that is discussed the most in philosophical journals today. The other is based on Bertrand Russell's early notion of a class as many, by which is meant not a class as one, i.e., as a single entity, but merely a plurality of things. It was this notion that Russell used to explain plurals in his 1903 *Principles of Mathematics*; and it was this notion that I was able to develop as a consistent system that contains not only a logic of plurals but also a logic of mass nouns as well.

    We compare these two logics here and then show that the logic of the *Among* relation is reducible to the logic of classes as many."

    "There are di¤erent views of the logic of plurals that are now in circulation. (1)

    One of these is based on a two-place relation of being among, as in 'Peter is among the juveniles arrested'. This approach seems to be the one that is discussed the most in philosophical journals today. The other is based on Bertrand Russell's early notion of a class as many, by which is meant not a class as one, i.e., as a single entity, but a mere plurality of things. It was this notion that I developed in 2002 as a provably consistent system that contains not only a logic of plurals but also a logic of mass nouns as well. (2) It also contains, as we show in this paper, the plural logic based on the Among relation. We will first compare

these two logics here and then show that the logic of the *Among* relation in Linnebo [2004] is reducible to the logic of classes as many.

We will first briefly discuss the plural logic based on the *Among* relation as described by Linnebo. Then we will brie‡y explain the basics of the logic of classes as many, and finally we will show how the logic of the *Among* relation is reducible to the logic of classes as many." (p. 757)

27. ———. 2016. "On Predication, A Conceptualist View." In *Philosophy and Logic of Predication*, edited by Stalmaszczyk, Piotr, 53-92. Bern: Peter Lang.

    Abstract: "Predication, as the nexus between a subject and a predicate expression, is the basis of the unity of a speech act, including speech acts in the plural and speech acts that involve mass nouns. A speech act, of course, is an overt expression of a mental act, e.g., a judgment; and therefore the unity of a speech act such as an assertion is really the unity of the judgment that underlies that act. Such a mental act, and therefore the speech act as well, has a unity based on how the referential and predicable roles of the subject and predicate expressions combine and function together respectively. What we propose here is to explain this unity of predication in terms of a conceptualist theory of logical forms that we claim underlies at least some important aspects of thought and natural language. Our conceptualist logic also contains an account of the medieval identity (two-name) theory of the copula, as well as an account of plural and mass noun reference and predication, the truth conditions of which are based on a logic of plurals and mass nouns."

28. ———. 2017. Epistemological Ontology and Logical Form in Russell's Logical Atomism.

    Not yet published.

    Preprint available on academia.edu.

    Abstract: "Logical analysis, according to Bertrand Russell, leads to and ends with logical atomism, an ontology of atomic facts that is epistemologically founded on sense-data, which Russell claimed are mind-independent physical objects. We first explain how Russell’s 1914–1918 epistemological version of logical atomism is to be understood, and then, because constructing logical forms is a fundamental part of the process of logical analysis, we briefly look at what has happened to Russell’s type theory in this ontology. We then turn to the problem of explaining how the logical forms of Russell’s new logic can explain both the forms of atomic facts and yet also the

sentences of natural language. The main problem is to explain the logical forms for belief and desire sentences and how those forms correspond to the logical forms of the facts of logical atomism."

29. ———. 2017. Russell's Logical Atomism 1914-1918: Epistemological Ontology and Logical Form.

    Unpublished paper, available on this site.

    Abstract: "Logical analysis, according to Bertrand Russell, leads to and ends with logical atomism, an ontology of atomic facts that is epistemologically founded on sense-data, which Russell claimed are mind-independent physical objects. We first explain how Russell's 1914-1918 epistemological version of logical atomism is to be understood, and then, because constructing logical forms is a fundamental part of the process of logical analysis, we briefly look at what has happened to Russell's type theory in this ontology. We then turn to the problem of explaining whether or not the logical forms of Russell's new logic can explain both the forms of atomic facts and yet also the sentences of natural language, especially those about beliefs. The main problem is to explain the logical forms for belief and desire sentences and how those forms do not correspond to the logical forms of the facts of logical atomism."

30. ———. 2018. A Modal-Ontological Argument and Leibniz's View of Possible Worlds.

    Unpublished paper, available on this site.

    Abstract: "We critically discuss an ontological argument that purports to prove not only that God, or a God-like being, exists, but in addition that God's existence is necessary. This requires turning to a modal logic, S5 in particular, in which the argument is presented. We explain why the argument fails. We then attempt a second version in which one of its premises is strengthened. That attempt also fails because of its use of the Carnap-Barcan formula in a context in which that formula is not valid. A third is presented as well using the proper name 'God' as a singular term, but it too fails for the same reason, though in a later section we show how this last argument can be

validated under a re-interpretation of the quantifiers of the background logic. In our later sections, we explain what is wrong

with the original first premise as a representation of what Leibniz meant by the consistency of God's existence, specifically as God's existence in a possible world. Possible worlds exist only as ideas in God's mind, and the consistency of God's existence cannot be God's existence in a possible world. Realism regarding possible worlds must be rejected. Only our world is real, the result of an ontological act of creation. We also explain in a related matter why according to Leibniz, Boethius, Aquinas and other medieval philosophers, God's omniscience does not imply fatalism."

31. ———. 2019. Can an AI System Think? Functionalism and the Nature of Mentality.

    Unpublished paper, available on this site.

    Abstract: "In this paper we consider the philosophical question of whether or not an AI system can think and be self-conscious. We note that in order to take this question seriously, we must reject metaphysical dualism. Then, because Functionalism gives an affirmative answer to our question, we turn to an account of Functionalism as a philosophical theory of the mind and the nature of thought. The basic assumption of Functionalism is that mentality consists essentially of functionality, and that as functional states and processes, mental states and processes can be structurally duplicated in the functionality of the electronic hardware of a suitably programmed AI system. According to Functionalism's basic assumption, structural duplication can be achieved if a functional isomorphism can be achieved between such an AI system and the human mind. We also describe three kinds or levels of self-consciousness and discuss the claim that all three levels can in principle be achieved in an AI system. The first kind, which all animals with a central nervous system have, is expressed in an animal's self-regarding behavior. The second is based on self-reference and reflexive abstraction on the content of thought. This is done in language by means of

nominalization where a predicate or declarative sentence is transformed into an abstract noun that denotes the content of that predicate or sentence. The third is based on a double reflexive abstraction on the intentional content of the self by means of a double nominalization. The first nominalization is a transformation of the referential use of the personal pronoun 'I' into a second order predicate true of all and only the properties of the self. The second is a nominalization of that second-order predicate into an abstract noun that denotes the intentional content of the self. In Functionalism, the goal is to achieve a functional isomorphism between the mental states and processes of humans and the electronic states of a suitably programmed AI. Given Functionalism's assumption that the essential nature of mentality is its functionality, such a functional isomorphism would suffice, according to Functionalism, for an AI system to be structurally duplicating, and not merely simulating, the mental states and processes that humans have. And hence an AI system can think and be self-conscious, according to Functionalism, in just the way that humans can."

Richard Sylvan [*born* Richard Routley] on Nonexistent Objects

Introduction

"On the June 16th, 1996, Richard Sylvan died of a sudden and unexpected heart attack. His death, at the relatively young age of 60, robbed Australasia of one of its greatest philosophers, arguably the most original that it has ever produced.

Richard was born Francis Richard Routley at Levin, New Zealand, on 13 December, 1935. He changed his name to Sylvan -- much to the confusion of a number of people -- when he remarried in 1983. After studying at the Victoria University of Wellington, he took a job at the University of Sydney, in Australia, where he lived for the rest of his life. He had several other jobs in Australia, including one at the University of New England, where, with Len Goddard, he trained a generation of Australian logicians. In 1971, he took up a position at the Australian National University, in Canberra, where he worked until his untimely death.

Richard was a most unusual person -- by any standards. He would rise at dawn, write philosophy till lunch, then pursue his hobbies, like building houses or tending the forests that he owned, till the sun went down, when he would open a bottle of wine and relax. To those who did not know him well, he could appear blunt, aggressive, and he could certainly be a difficult person for university administrators to get on with. But those who got to know Richard well knew that he was a shy, caring, and warm person. For this he was loved by his many friends and students (not disjoint collections). One day, a biography will be written; but this is not it.

Richard made major contributions to many areas of philosophy: relevant and paraconsistent logic, Meinongianism and metaphysics, environmental ethics, to name but the most important. To others, these might seem a rather disparate collection, but for Richard they were all part of one seamless whole; solutions to (and the generation of) many philosophical problems presupposed particular solutions in areas others viewed as far a field. Many philosophical areas, he thought, suffer from the narrow scope of their authors' concerns.

Another of Richard's philosophical trademarks-in fact, perhaps the major one-was taking up grossly unpopular views and defending them doggedly. If relatively few people were ultimately persuaded by him, all had to admit that the views were not as silly and easily disposed of as they had hitherto thought." (p. 1)

From: Dominic Hyde & Graham Priest, "Editors' Introduction" to: *Sociative Logic and Their Applications*, Aldershot: Ashgate 2000.

"Richard Sylvan (né Routley) was undoubtedly one of Australasia's most wide-ranging and systematic philosophers. The astonishing breadth of his philosophical work includes writings on logic, metaphysics, philosophy of language, epistemology, environmental philosophy, social philosophy, political philosophy, ethics, philosophy of science. philosophy of mind and computation theory. A major reason for this intellectual diversity was his view that 'received logical theory and mainstream philosophical thinking involve ... fundamentally mistaken assumptions'(1) These mistaken assumptions were, in fact, seen as so fundamental that nothing less than 'logical revolution' and the abandonment of 'the main philosophical positions of our times' was called for. 'The same mistaken philosophical moves ... appear over and over again in different philosophical arenas ... in metaphysics, in epistemology, in the philosophy of science, ... in ethics. in political theory, and elsewhere, in each case with serious philosophical costs.' (2) This view, coupled with Sylvan's desire to set things straight, led him to work in all these areas and more. His usual method of work was to rise at dawn and write until lunch. This philosophical writing (decipherable to only a select few until typed by one such) amounted to a considerable body of work. By my reckoning at the time of his death in June 1996 he had published as sole author, joint author or

editor, 10 books, 16 booklets and nearly 200 articles in academic philosophy -- as well as numerous unpublished articles and articles contributing to general intellectual debate on social policy and environmental matters. In addition to the wide-ranging nature of this profile outpouring of philosophy, Sylvan's work was also distinctive in character. As noted, he thought that mainstream philosophical thinking was doomed to failure and the theories he argued for were accordingly unorthodox and often highly innovative. (3) Moreover he took the view that philosophy ought to strive for uniformity in its resolution of problems.

'Virtually every philosophical problem has a range of potential resolutions. A coherent philosophy selects and develops its resolutions uniformly, with connected solutions for related problems, not a different sort of solution for every (sort of) problem. (4)

Accordingly, his work is characterized by the attempt to develop and apply these unorthodox theories in a wide range of contexts. Thus his work represents a broad, uniform and unorthodox approach to philosophical problems. Though making a contribution to philosophy (and intellectual life more broadly) well beyond his writings in logic and metaphysics, a survey of Sylvan's work will show that the majority of it concentrates directly on issues in these two areas, and where it does not hear directly on them it typically presents them as having central underlying import. One reason, of course, was his acceptance of the idea of the centrality of logic to philosophy (see Routley 1980, iii) and one has only to look at the Essays gathered together in Sylvan (2000) to see just how seriously he took this idea. (...). However he was also keen to emphasize the importance of metaphysics to all reaches of philosophy and, with the possibilities opened up by research in non-classical logic, substantial developments in metaphysics were there to pursue and pursue them he did." (pp. 181-182)

Notes

Routley's Noneism

" Noneism was created by Richard Routley. According to him the universe is a realm that comprises nonexistent objects. In this universe are included, beside real objects, sets that are contradictory or even absurd, and objects that we can think about, or imagine, but that are beyond the limits of reality. For instance, propositions like "the Squond is square" and "the Squond is round", in which Squond is an object that is square and round, are quite legitimate. Of course the Squond does not exist but - and this is the important point - it can be thought. Examples of less aggressive insolence, are more than abundant. For instance "the fairy Wandolina is very gentle" or "Zeus is the most powerful of the Olympian gods" are expressions fully understandable. The noneist system complies the three conditions to be metaphysical theory.

1. It encompasses the whole world, physical and mental,

2. it offers explications of meaning, and explanations of facts, and

3. it is not empirically corroborable.

That it contains objects with certain properties that are described by unverifiable propositions, is essential in an noneist universe. We have just shown two of them. This unverifiability is quite different from the one we find in physical theories. In these theories, when a new fact is discovered, its corresponding proposition must be deduced from the premises that are valid in the system. (*) This means that it must be explained, and to explain a proposition P, means that P must be logically deduced from previous theorems of the system (every axiom is a theorem). (**) This deduction is ordinarily done utilizing classical logic. Some physicists pretend that the only way to deduce quantum propositions, is by means of a "quantum logic". But this is a farfetched methodology, because the reasons they expose to justify their claim, are based on the fact that the De Morgan laws are not valid. But these laws are invalid, because they are identified with the addition of certain states that have nothing to do with logic.

I dare to qualify noneism as a metaphysical theory, because it complies with conditions 1, 2, and 3. That it complies with the first, is evident. Condition 2 is also complied with because noneist theory explains many facts. For instance, how is it possible that a child of five or six years, understands perfectly well a fairy tale. The only explanation of this miraculous fact is that, as the tale advances, the child is apprehending objects that do not exist. This apprehension must not be confounded with imaginative objects. The objects the child imagines do not exist, but they are viewed as subject dependable. On the other hand, the objects we apprehend listening to the story are not subject dependent. The child does not invent them, he (or she) sees the images that the story is suggesting. Different children can "see" different images, but the images that a child has will have a certain structure, and the structure will be the same for all children (and, of course, for all adults). Moreover, if a child "sees" that color *Ci* is adjacent to color *Ck*, the other child will "see" other colors *Di* and *Dk* but in the same order, that is *Di* and *Dk*, will be adjacent.

The third condition is also complied by the system: non-verifiability with respect to sensory objects, and this non-verifiability is absolute.

It is assured by definition. We qualify it as "metaphysical", applying a frequent procedure in pure mathematics. If we define a complicated concept having definite properties, say, {A, B, C, D}, then, on behalf of easiness, we devise another concept that includes the first one, but has a note E, (there can be more than one) present in {A, B, C, D, E}. A classical example is the concept of zero. We can develop set theory without employing it. But as the theory advances, it becomes frightfully complicated." (pp. 33-35)

Notes

(*) The word "system" is used in its usual meaning. This meaning is quite different from the way it is employed in physics, in which it means an object.

(**) We say "axioms" because, in mathematical physics, the propositions from which all others must be deduced, play the role of axioms. With the exception of constructive mathematics, some axioms of geometry (for instance, the axioms of "betweenness", and finite set theory, all the axioms are hypothetical propositions. The truth probability of a theory increases through corroborations of its explanations, or through the verification of its predictions.

Annotated bibliography of the logical works of Richard Sylvan [*né* Routley] (1960-1977)

Bibliography

N. B. *In 1983 Richard Routley changed is name in Richard Sylvan and Val Routley changed is name in Val Plumwood.*

1. Routley, Richard, and Gunderson, K. 1960. "Mr. Rescher's Reformulation of the Ontological Proof." *Australasian Journal of Philosophy* no. 38:246-252.

   "In the midst of revived philosophical interest in theological issues, we wish to record our objections to one recent attempt at reformulating the ontological proof for the existence of God. x In trying to navigate around what he calls the three "traditional objections" to the proof viz.: (1) that it "rests upon an explicit definition per genus et differentiam" which in turn "depends upon the thesis that existence has the status of a predicate", (2) that it invokes "the procedure of defining into existence", and (3) that if

   the "proof were logically sound, its theological serviceability would be insignificant'--Mr. Rescher, we believe, runs aground on the following criticisms."(p. 246)

   (1) "The Ontological Proof Revisited", this Journal, August, 1959.

2. Routley, Richard. 1963. "Review of *Abstract Sets and Finite Ordinals*, by G. B. Keene." *Australasian Journal of Philosophy*

no. 41:279-284.

3. ———. 1965. "What Numbers Are." *Logique et Analyse* no. 8:196-208.

   Abstract: "Cardinal numbers are non-distributive properties of certain manifolds. This thesis, the P-C thesis, though often (in effect) proposed, does not seem to have been fully worked out, and has in fact been subject to repeated attacks. Recently the thesis that numbers properties of classes has been criticised by Professor Benacerraf (*). My main aim here is to elaborate the initially plausible P-C thesis and to defend it against criticisms."

   (*) In his stimulating article 'What numbers could not be', *Philosophical Review* LXXIV (1945), 47-73.

4. ———. 1966. "On a Significance Theory." *Australasian Journal of Philosophy* no. 44:172-209.

   "Not all declarative sentences are statement-capable. A declarative sentence P is *statement-capable* in context c if and only if P yields a statement in c. Given that all statements are either true or false, P is statement-capable in c if and only if P is *truth-valued* in c., i.e., yields a truth or falsehood in c." (p. 172)

   (...)

   "Motivation for developing a significance theory arises from several connected sources: firstly, from the role of significance in the solution of a whole range of philosophical paradoxes and puzzles; secondly, from the fact that philosophers repeatedly appeal to significance considerations and principles; and thirdly, from the fact that many idiolects, both ordinary and technical, distinguish some sentences as non-significant and satisfy some significance principles. The importance of the first source is illustrated by the role significance and category theories have played in epistemology and particularly in the philosophy of mind. With respect to the second source, a significance logic has a similar role to play in assessing the correctness of philosophical arguments and moves as Aristotelian and classical logic have had. Given the

third source, a significance theory is a vital ingredient in attempts to further formalise discourse, and to take further account of both everyday and technical usage." (p. 177)

5. ———. 1966. "Some Things Do Not Exist." *Notre Dame Journal of Formal Logic* no. 7:251-276.

   "The main objects of this paper are to suggest a definition of 'exists', to propose solutions to difficulties raised within restricted predicate logic with identity by failures of existential presuppositions of purportedly referring expressions such as individual constants and definite descriptions, to develop within a semantical system R*, with the syntax of a restricted applied predicate calculus, the logic of 'exists', and to unify within =R*, i.e. R* with identity, several hitherto distinct logical theories, to construct theories of definite descriptions, and to criticize certain widely accepted criteria for the ontological commitment of a theory. The logical developments in this paper are limited almost entirely to those that can be carried out in a first-order predicate logic with identity but without modal or intensional functors." (p. 251)

6. Routley, Richard, and Goddard, Lenn. 1966. "Use, Mention and Quotation." *Australasian Journal of Philosophy* no. 44:1-49.

   "It is the thesis of this paper that an extensive revision of those ways of talking about expressions which are usually recognized by logicians is of paramount importance if we are to escape the absurd conclusions and purely technical restrictions which arise from a confusion of the kinds of distinctions which it is often necessary to make both in logical and non-logical contexts. We propose, therefore, to consider in detail the commonly recognized distinction between types and tokens, and secondly between use and mention, in order both to emphasize the deficiencies of the standard account and to indicate the steps which are required for the development of a special and systematic vocabulary for talking about linguistic expressions. It is necessary, however, for the purposes of exposition before new conventions are introduced

   to adopt the ordinary practice of using single quotes to indicate the fact that a linguistic expression is being mentioned, and

double quotes to indicate reported speech (and other *quasi*-mentionings);

sometimes, too we set off an expression which is to be mentioned on a line by itself." (p. 2)

7. Routley, Richard, and Montgomery, Hugh. 1966. "Contingency and Non-Contingency Bases for Normal Modal Logic." *Logique et Analyse* no. 9:318-328.

   "Contingency and non-contingency bases for modal logics provide direct bases for various logical investigations of philosophical interest. For example: for logics of causation and causal implication, for certain theories of entailment, for syllogistic systems with only contingent propositions, and for theories of future contingents. Furthermore by taking contingency as primitive various new extensions of weak modal logics - extensions which include systems S6-S8 and provide interpretations of philosophical interest for these neglected systems - are suggested. Contingency and non-contingency bases are also of some formal interest; for instance S5 has a very simple and elegant formulation in terms of non-contingency. In this paper we present contingency and non-contingency bases for familiar normal modal logics, specifically for T, S4 and S5." (p. 318)

8. Routley, Richard. 1968. "Decision Procedures and Semantics for C1, E1 and S0.5." *Logique et Analyse* no. 11:468-471.

9. ———. 1968. "The Decidability and Semantical Incompleteness of Lemmon's System S0.5." *Logique et Analyse* no. 12:413-421.

   "Two decision procedures are given for the modal system SO.5, a Gentzen style decision procedure and a von Wright-Anderson type decision procedure. The second procedure leads easily, as Cresswell has indicated in [2] using Kripke semantics, to a completeness result for SO.5. However under the intended interpretation for SO.5 proposed by Lemmon in [6] and [7] and adopted by Cresswell, namely that the necessity connective is interpreted as 'it is tautologous (by truth-table) that', the system is incomplete. To complete the system under the intended interpretation conventionalistic theses like ∇ □p

(contingently necessarily p) must be added to SO.5. But this augmented SO.5 is under its intended interpretation a formalised metalogic of classical sentential logic {see [7]). Hence the (usual) metalogic of classical sentential logic is conventionalistic about modality. (p. 413)

10. Routley, Richard, and Montgomeery, Hugh. 1968. "Non-Contingency Axioms for S4 and S5." *Logique et Analyse* no. 11:422-424.

    "In [3] some contingency and non-contingency bases were developed for normal modal logics. Some of the axioms presented there for extending T to S4 and S5 are sufficiently strong to give these latter systems when added to the non-normal system S3." (p. 422)

12. Routley, Richard, and Montgomery, Hugh. 1968. "On Systems Containing Aristotle's Thesis." *Journal of Symbolic Logic* no. 33:82-96.

    "Apart from merits or defects of P_{A1} however, its existence demonstrates the feasibility of a new approach to the logic of propositions involving the principle of subjunctive contrariety. We thus have good reason to investigate the effect this principle, and a concept of conditionality compatible with it, might exert if intro- duced into standard quantification theory, into set theory, into modal logic and into epistemology and the philosophy of science." R. B. Angell(1)

    "Introduction. The thesis $p \rightarrow q \rightarrow \sim (p \rightarrow \sim q)$, Angell's *principle of subjunctive contrariety*, here called *Boethius' thesis*(2) or *Boethius*, has as a consequence *Aristotle's thesis*(2) $\sim (\sim p \rightarrow p)$. The effect of *Boethius* or even of *Aristotle* alone, in quite weak sentential logics, is sufficient to cast serious doubt

both on the merit of proceeding in the directions Angell suggests and on the value of connexive logics.(3) To show this we examine the consequences of adding to a basic system Z1 which we describe as *strong normal implication*, the axiom *Aristotle*. This augmented system Z1a is inconsistent with a number of principles of implication which it is very difficult to reject on semantic grounds. Further semantic problems arise when Z1a is augmented by *Fact* to give Z1b, and when Z1b is augmented by *Antilogism* and *Mat Taut* to give Z1c or by *Boethius* to give Z1d. As these five systems are all sublogics of both Angell's P_{A1}, and McCall's CCl (see [6]) tlfe'consequent interpretational problems for P_{A1}, and CC1 are immediate. In the *Analytica priora* (57b-3 f) Aristotle argues that ... it is impossible that the same thing should be necessitated by the being and by the not-being of the same thing'".

(3) 'Connexive logics' are characterised by McCall in [Connexive implication, pp. 415-416].

Fact p → q → . p . r → q . r Principle of the factor

Antil p.q → r -→. p. ~ r → ~ q Antilogism.

*Mat Tau*t p ⊃ p . p Material tautology.

13. ———. 1968. "Modal Reduction Axioms in Extensions of S1." *Logique et Analyse* no. 11:492-501.

"Modal logics are commonly formulated with a primitive necessity or possibility operator, though often they may equally well have non-contingency or contingency as the sole modal primitive, necessity and possibility being introduced by definition (1). Examples of normal modal logics with such bases are given in [2], and similar foundations can easily be constructed for the weaker classical systems such as S1, S2 and S3. One attraction of these formulations is that non-

contingency extension axioms often provide very simple and illuminating relationships between different modal systems, and another is that iterated modalities are seen from a different aspect (2)." (p. 492)

(1) Sufficient conditions for this to be possible are that SSE is derivable and that p.(□p v □~p) = □p is provable. Example of systems for which these conditions fail are SO.5. S1°. S2°.

(2) By an 'iterated modality' we mean a sequence of zero or more symbols each of which is either a negation symbol or a primitive monadic modal symbol.

14. Routley, Richard. 1969. "The Need for Nonsense." *Australasian Journal of Philosophy* no. 47:367-383.

"It *is* important to have a distinct category of nonsense into which to bundle grammatical indicative sentences which do not express truths or falsehoods.

For, on the one hand, a high redefinition of 'grammar" which brings nonsignificant sentences out as ungrammatical, not only eliminates the valuable distinction between sentences with textbook grammatical defects and nonsignificant sentences; it also makes the quite unwarranted assumption that all non-significance is recursively generated non-significance. But not all nonsense is obvious, or recursive nonsense. Still more damaging, nonsignificant sentences, unlike seriously ungrammatical sentences, can figure in valid arguments and can occur as unquoted components of grammatical sentences. Yet, on the other hand, theories which eschew non-significance as a further sentence-value beyond truth and falsehood are not only bound to be less comprehensive than, and mere special cases of significance theories (see [15]); they are in fact inadequate to deal with the logical and linguistic data--linguistic data which the grammatical theory does acknowledge--which significance theories are designed to

handle. (For a sketch of some of the relevant data, see [15], p. 177)." (p. 367)

(...)

"Significance logics are richer than classical logic; for they include all theses of classical logic for suitably restricted significant sentences; but even the fundamental predicate 'S' of significance theory cannot be explicitly defined in classical predicate logic. Now where two theories are not equivalent theories there are two cases to consider. Either the theories cover (roughly) the same data and one or the other contains false or defective sentences.

Then the one that does is false or defective, and the other, if true, is to that extent preferable. Or both theories are true. Then they must cover different fields and so are not distinguishable through simplicity; in particular one theory may be more comprehensive than the other, so overriding simpficity.

Simplicity then is not an adequate ground for deciding against significance theories." (p. 383)

15. ———. 1969. "A Simple Natural Deduction System." *Logique et Analyse* no. 12:129-152.

"A natural deduction system ND is introduced and proofs in it illustrated. This system is much simpler and more flexible than familiar natural deduction systems: it avoids completely such complicating devices as subscripting, flagging, ordering of variables, and distinctions of several sorts of variables or parameters. Furthermore proofs are valid line by line. ND is presented as a formal system. It still needs emphasizing that natural deduction systems can be made just as. formal as Hilbert-type systems. The precise conditions on substitution -

quite important for natural deduction but often suppressed - are made explicit in the rules of ND." (p. 129)

16. ———. 1969. "Existence and Identity in Quantified Modal Logics." *Notre Dame Journal of Formal Logic* no. 10:113-149.

    "The aim of this paper is to present a way in which philosophical objections to the development of a combined quantification and modal logic based on S5 can be overcome. In more detail, the objectives are to show that S5 is immune to criticisms directed at those theorems which distinguish it from S4 and T; that problematic theorems(1) of modalised predicate logic like the Barcan formulae $[\Diamond(\exists x) f(x) \supset (\exists x) \Diamond f(x)]$ and $[\Diamond(\exists t) g(x, t) \supset (\exists t) \Diamond g(x, t)]$ can be appropriately qualified once existence is explicitly treated; that puzzles over identity can be escaped by a more elaborate treatment of identity than the standard treatment; and that difficulties associated with quantification into modal sentence contexts can be cleared away given these treatments of existence and identity. A combination of these moves suffice, so it will be argued, to meet standard objections, most forcefully presented by Quine(2), to quantified modal logics. Admittedly a full elaboration of these moves calls for some sentence/statement distinction, some analytic/synthetic (or necessary/contingent) distinction, and some sense/designation (or connotation/denotation) distinction: but although, consequently, it is not to be expected that a combination of these moves will satisfy Quine, they may satisfy some who have been disturbed by the objections Quine raises." (p. 113)

17. Routley, Richard, and Montgomeery, Hugh. 1969. "Modalities in a Sequence of Normal Noncontingency Modal Systems." *Logique et Analyse* no. 12:225-227.

"Some properties of sequences of systems lying between T and S4, and T and S5, having added axioms of the form $\Box^n p \supset \Box^{n+1} p$ have been investigated in [4] and elsewhere (1). These systems have infinitely many modalities for $n > 1$. Here we consider an analogous sequence of noncontingency based systems, the *i*-th member of the sequence being denoted by $T_\Delta{}^i$ where *i* is any positive integer. The primitive basis of $T_\Delta{}^i$ is given by adding the axiom $\Delta^i p$ (where ' Δ^i denotes *i* iterations of the noncontingency modal connective 'Δ', and 'Δ° *p* denotes '*p*') to either $S1_\Delta$ (see [3]) or to one of the noncontingency based formulations of T given in [2]. The equivalence of these bases follows from Theorem 5. of [3]. The first member of this sequence, $T_\Delta{}^1$, is deductively equivalent to the Trivial System, the second, $T_\Delta{}^2$, to S5, and the remaining members of the infinite sequence lie between S5 and T. Each system $T_\Delta{}^i$ has 2 (*i* + 1) distinct modalities" (p. 225)

18. Routley, Richard, and Routley, Val. 1969. "Categories - Expressions or Things?" *Theoria* no. 35:215-238.

"Is significance a matter of things or of descriptions of things?

That is to say, is it the couplings of certain individuals and certain properties or relations that are properly said to be significant or non-significant, or is it the couplings of descriptions and predicates?

A common answer is that it is either or both, or that it doesn't matter which we say. For it is assumed that to any non-significant coupling of an individual and a property there corresponds a nonsignificant

coupling of expressions, and vice versa. This isomorphism thesis(1) can be stated more generally as follows: there is a one-one correspondence between things-relations couplings and description-predicate couplings preserving significance.

Another answer to the main question is that significance is a matter of things and their relations, and not really a question of description at all. There is a strong temptation, supported by tradition and by some ordinary speech, to adopt such a thing or essentialist thesis of significance, to say that significance is concerned with things irrespective of how they are referred to or even whether they are referred to, and that, furthermore, things fall into logical kinds or categories as they do into natural kinds." (p. 215)

(...)

"The distinction between significance and absurdity resolves the initial puzzles, which arose from incompatible ways of looking at significance. Category theories based on both significance and absurdity are viable. Because, however, one theory is not the isomorphic image of the other the isomorphism thesis is false; and since the theories cannot be confused without disastrous consequences, it does matter what we say." (p. 238)

(1) An isomorphism thesis is stated explicitly by F. Sommers 'Types and Ontology' *Philosophical Review*, vol. 72 (1963), pp. 327-363; e.g. pp. 350-1: 'linguistic structures and ontological structures are isomorphic'.

19. ———. 1969. "A Fallacy of Modality." *Noûs* no. 3:129-153.

"The ancient principle of distributivity of necessity (DN for short), that necessary propositions only entail necessary propositions, has acquired an upstart companion, the distributivity of contingency (DC), which threatens to borrow some plausibility from DN; violations of these principles are sometimes lumped together as "fallacies of modality". The DC principle, according to which contingent statements only entail contingent statements, has played a specially important role in the discussion of entailment; and in particular it has taken a central part in Anderson and Belnap's important theory of entailment E. The DC principle has also had a major part in attacks on linguistic theories of logical necessity. We contend, however, that the principle and minor modifications of it, are false. We argue that the principle provides an example of a strong false thesis drawing its plausibility from its association with a weak but trivial counterpart which cannot however perform the task of the strong principle. We also explain in detail why no version of the principle can fulfill the role for which it is needed in E.

It is our contention that the real fallacy concerning DC is that of taking violations of DC as fallacious. For DC itself is a modal fallacy." (pp. 129-130, a note omitted)

20. Routley, Richard. 1970. "Non-Existence Does Not Exist." *Notre Dame Journal of Formal Logic* no. 11:289-320.

"The main aims of this paper are to explain criteria for the identity of individuals, to compare various criteria for the existence of properties and for the existence of propositions, and to present certain theses concerning the existence and identity of individuals, of propositions, and of properties.

Several other topics are, however, treated incidentally; for example an extended sentential logic designed to take care of certain semantical paradoxes and truth-value gaps by allowing for statement-incapable sentences is sketched.

In order to attack in a formal way the question of the existence of properties and relations and to formalise widely employed criteria for the existence of attributes, i.e. of properties and relations, an extended predicate calculus must first be

introduced. As a first move it is valuable to determine how much can be done in the simplest and most accessible of higher order functional calculi, viz. second-order functional calculus. Now this logic has to be so designed that it can express such propositions as "Some properties do not exist" and "All properties, whether possible or impossible,... .(e.g. exist)". At first this suggests that a system like R*, which allows for quantification over all possible individual items, be extended to second order.(1)" (p. 289)

(1) The system R* is presented in R. Routley, "Some things do not exist," *Notre Dame Journal of Formal Logic*, Vol. 7 (1966), pp. 251-276.

21. ———. 1970. "Decision Procedures and Semantics for Fey's System $S2^{o}$ and Surrounding Systems." *Zeitschrift für mathematische Logik und Grundlagen der Mathematik* no. 16:165-174.

"The systems investigated in detail are Feys system $S2^{o}$ (of [3]), $S2^{e}$, S2, C2 and E2. The same methods as are used in studying these systems extend to a much larger class of modal logics; some extensions are outlined in section IV. For the systems studied three decisions are provided; in section I by Gentzen methods; in section II by extended truth-table methods; and in section III, as a corollary to completeness results, by the finite model property." (p. 165)

22. ———. 1970. "Extensions of Makinson's Completeness Theorems in Modal Logic." *Zeitschrift für mathematische Logik und Grundlagen der Mathematik* no. 16:239-256.

"Completeness theorems are derived, using the maximal consistent set construction, for a large class of sentential modal logics. The paper extends MAKINSON's[1)]method (of [6]) to systems based on the modal logic C2 (cf LEMMON[4]), on the system $C2^{a}$ (of FEYS[1]), on system C2" for each *n*, and on the weak system C1 (of LEMMON[3]) and S0.5". The systems

considered include, among others, all systems treated in MAKINSON[6], all modal systems treated in LEMMON[4] and [5], various systems introduced in [7], all E systems, all C systems, D1 and D2, S0.5, $S2^{o}$, $S2^{e}$, $S3^{o}$, $S3^{e}$, $S4^{o}$, T*, Parry's system S3 + □ ◇□ A → □ A, S3.5, S6, S7, S8 and S8.5. (For details of many of these systems see FEYS [1].)

The methods are readily extended to various other systems, e.g. to the conventionalist systems of [7] and, as is well-known, to extensions of 54, and they can be extended to quantified modal logics. For certain systems considered the completeness results are combined with a solution of the decision problem by the finite model property." (p. 239)

"The standard semantics for quantification logics have serious limitations; they are more complicated than they need be and more set theoretical than they should be. In support of this evaluation alternative simpler and leas set-theoretical

semantics are provided for quantification and free quantification logics both without and with identity, and for second-order significance logic. These semantics, domainless semantics, are defended against objections as to their intelligibility and satisfactoriness, and appropriate consistency and completeness theorems are proved in order to show the comparative adequacy of the semantics. Domainless semantics, by assigning values en bloc to atomic wff, eliminates the otiose notion of a domain of interpretation and n-place relations on this domain of entities, and thereby eliminates the associated correspondance theory of truth which is built into the reference selections and truth evaluations of standard semantics. It does this without introducing names in the style of, what is similar, the substitution interpretation of quantifiers, and so it avoids legitimate objections that have been made to substitution semantics (1)."

"No modal logic so far presented adequately represents radical conventionalism. Yet conventionalism about modalities is a very pervasive doctrine. In this paper we make a start on filling this serious gap in the

literature.

Radical conventionalism is distinguished by the thesis:

(R). *All assertions of modalities are contingent.*

(...)

Radical conventionalism is inconsistent with *all* Lewis modal logics, as we shall show. It does not follow, however, that

radical conventionalism is, as has often been assumed, inconsistent. One of our main aims is to exhibit a class of consistent modal logics in which thesis (R) is satisfied. This is a major step towards showing that radical conventionalism is a consistent doctrine.

We distinguish radical conventionalism from two other main positions regarding modality which have also been called conventionalisms. For radical conventionalism has frequently been confused with these other

doctrines, to the detriment of each position since each pair of positions entails mutually inconsistent principles." (p. 131)

    Abstract: "In the first part of this paper, we developed a semantics for the system R of relevant implication, which is the non-modal part of Anderson-Belnap style systems of

entailment. In the present paper, which we have endeavored so far as possible to render self-contained, we add an S4-style theory of necessity, getting the system NR of [1]. This enables us to introduce an entailment connective on the definition. (1) $A \Rightarrow B =_{df} N(A \rightarrow B)$, where $\rightarrow$, is relevant implication, and accordingly to adapt the semantics for relevant logics developed in [2] to a theory of entailment proper.' We note that although the question whether the NR-theory of entailment coincides exactly with that of E remains open, both the results of [1] and the motivation provided for the pure theory of entailment in [3] suffice to settle it for all practical purposes - every motivating condition ever put forth for E is satisfied in NR, and in all known cases of interest involving formulas built up from entailment and the truth-functions, E and NR coincide exactly with respect to provability. Indeed, although we should like very much to see the remaining open question definitively solved, we hazard here the guess that if E and NR should happen to diverge on some formula, it will be E which turns out thereby to be semantically deficient; we do not think that will happen. In any event, we present with confidence the present results as the semantics for Anderson-Belnap style entailment." (p 53, a note omitted)

"In [1] and [2], we developed Kripke-style semantical postulates for the system R of relevant implication and the system NR of relevant implication with modality. The latter suffices for a theory of entailment as well, though we left the

question open in [2] whether that theory is precisely the Anderson-Belnap system E of entailment. The time has come to extend our semantical methods to other systems of relevant logic besides the system R. We shall do so in two stages. The present paper deals only with positive systems of entailment, since these may be handled quite simply along previous lines; complications arising from negation are put off until the sequel. We do not consider quantified entailment logics explicitly, though quantifiers may be handled in the style of [1] (or differently, if the reader prefers). Accordingly, we present here a semantical analysis of the Anderson-Belnap systems R+ of positive relevant implication, E+ of positive entailment, and T+ of positive ticket entailment; by ringing the changes on the axiomatizations of these particular systems, we include as well related relevant logics; there is, on our approach, a natural minimal one, which we can call B+." (p. 192)

30. ———. 1972. "Algebraic Analysis of Entailment I." *Logique et Analyse* no. 15:407-428.

"In [1]-[4], the authors have developed a semantical analysis of Ackermann-Anderson-Belnap style systems of entailment similar to the well-known analyses of Lewis style strict implication due to Kripke, Hintikka, Lemmon, and others. The present paper uses these semantic insights - in particular those of [3] - to develop a general algebraic analysis of entailment logics. Such an analysis has already been furnished by Dunn in [5] for the system R of relevant implication, who interpreted the system R in a certain class of partially ordered algebraic structures, namely the DeMorgan monoids (1). A similar analysis, as we report, will do for entailment logics generally. This present analysis, as it remarkably turns out, is strongly reminiscent of the very differently motivated connections

drawn between the theory of combinators and certain theorems of intuitionist logic by H. B. Curry in [6] and [7]. The present paper will analyze chiefly negation-free entailment logics, which are the most natural algebraically; some remarks, however, will be inserted to show where the enterprise tends when negation too is added. Our key algebraic notion will be that of an Ackermann groupoid, defined below, which serves to explicate algebraically the minimal relevant logic B+ of [3] and which comes on the addition of postulates to explicate also more familiar relevant, modal, and intuitionist logics, such as T+, E+, R+, S4+, and the intuitionist sentential calculus J." (p. 407)

(1) The theory of residuation, on which Dunn's and the present work rests, was developed by Ward and Dilworth; cf. [7] for references.

32. Routley, Richard, and Routley, Val. 1972. "The Semantics of First Degree Entailment." *Noûs* no. 6:335-358.

    "We concentrate on first degree semantics because this sharpens and simplifies the choice among rival systems. For different systems may have a common first degree theory. In particular a large class of strict implication systems (including all Lewis systems) have the same first degree; and the system FD coincides with the f.d. theory of the system E of Anderson and Belnap (presented in [1] and [2]) and also of a number of rival entailment systems both included in, including, and only intersecting E (see [11]). Thus the divergence of entailment from strict implication, and from other implications such as connexive implication,

    is already clear at the first degree. Most of the traditional and current disputes come up and can be settled at the first degree level, for example, disputes about the paradoxes and their effects, and as to the adequacy of principles such as Disjunctive Syllogism. Thus choice of a first degree system already fixes in large measure one's position on entailment. Furthermore, for a number of important notions the higher degree structure is either peripheral, as with inclusion of logical content, or, as with causal sufficiency, not well defined.

    Finally the first degree has much simpler semantics than the full systems; it is not complicated by questions as to which setups or structures implications are in or what relations hold between set-ups, which determine the fate of higher degree laws." (pp. 335-336)

    "In spite of the central role which the concept of significance has played in recent philosophy, very little has been done to produce a general theory in terms of which the various claims can be evaluated. Both Russell and Ryle go some way towards the development of particular significance theories which they then apply to the examination of philosophical theses, and Russell's theory of types is expressed partly in terms of formal criteria. But the two theories, though similar, are inconsistent with each other, and each is seriously incomplete. Both depend crucially on the acceptance of intuitive and unstated principles.

    It is our purpose to develop a general formal theory of significance in terms of which significance claims, and arguments by means of which they are made, can be assessed. Thus we aim, eventually, to provide a logic, not previously developed, for much of modern philosophy.

    This aim might be challenged in one of three ways. First, even though it is accepted that some sentences are nonsignificant, it might be thought that there is no need of a special logic to take account of them since the ordinary principles of classical two-valued logic can be applied to arguments in which they occur. Secondly, it might be said, given that there is a need for a special logic, the peculiar features of nonsignificant sentences make its development impossible. Thirdly, it has sometimes

been suggested, nonsignificance can be wholly explained in terms of other well-understood concepts: in particular, it can either be identified with the ungrammatical, in which case nonsignificant sentences should be excluded from all arguments and the only logic which is necessary is the classical two-valued logic over significant sentences; or it can be identified with the necessarily false, and in this case significance claims and arguments can be handled within classical modal logic.

Consider the first objection. The point of and need for a general formal theory of significance can be justified on general grounds by appealing to the usual reasons for underpinning philosophical investigations by logical studies: namely the clarity and systematisation which result, and the fact that the philosophical theory can be tested for consistency and is generally more readily assessed and open to falsification. But it can also be justified on special grounds since, without it, the assessment of particular significance theories, if not impossible, is at best intuitive. Unless general principles are formulated and justified, it remains obscure which critical arguments are valid within and against a particular theory. Thus, without some systematisation of significance principles, many philosophical arguments, such as those of Ryle and Strawson on the philosophy of mind, are impossible to assess.

As one example of the need to make explicit the principles which are assumed, and the need to evaluate them, consider Russell's assumption, which is nowhere justified, that the paradox argument evaporates and the conclusion no longer follows once it has been shown that the premisses are meaningless. This amounts to saying, in general, that a nonsignificant sentence has no implications. But if this is so, then Ryle's *reductio ad absurdum* technique, and Wittgenstein's declared aim, seem to be illogical. For here, the intention is to show that a given sentence is nonsignificant because it has implications which are nonsignificant. But if it is indeed nonsignificant, then it was so before the actual implications were drawn, and in terms of Russell's principle it cannot have these implications because it has none at all.

In order to resolve problems such as this, it is necessary to construct associated significance logics for particular theories of significance and to ask whether there is an internal inconsistency in either theory, whether there are general principles incompatible with either or both, and whether there is a general theory which can consistently include both. It may be, for example, that the apparent incompatibility of Russell's principle and Ryle's is not real. This would be so if they were adopting different implication connectives; in this case, both principles could consistently appear in the same general theory.

None of these questions can be settled using only a classical two-valued logic, however, since what is in issue is just which relations hold between truth-valued sentences, on the one hand, and nonsignificant sentences, on the other. Similarly, it is inadmissible to evaluate positivist criteria of significance using principles of two-valued logic alone since, given that some sentences are nonsignificant, such a logic cannot hold generally. But the mere recognition that at least a three-valued logic is necessary is of itself inadequate. For unless the *relevant* three-valued logic is specified, the criteria are still not fully assessable." (pp. 5-7)

34. Routley, Richard, and Brady, Ross. 1973. "Don't Care was Made to Care." *Australasian Journal of Philosophy* no. 51:211-225.

"We believe that the deep structure of natural languages, and hence of the languages in which philosophical problems are characteristically formulated, will have to be based on an enriched significance logic which has a third value -- nonsense or non-significance -- and not on a classical two-valued logic which only has truth and falsity as its values. Such logics will be required not just in providing a semantics for natural language but also, for what is even more important, in the assessment of informal reasoning and in determining the scope of valid argument. But our view that there is a need for nonsense as a value has been challenged, most recently by Haack(1) who thinks that a variation on Quine's position can be sustained, that central examples of non-significant sentences are 'Don't Cares' which can be brought within the scope of classical logic by some fairly arbitrary assignments of truth-values to them.

Though we shall concentrate on Haack's case against nonsense as a further value, our criticism has more than merely local interest, for many of the defective moves that Haack makes in defence of classical logic have wide currency." (p. 211)

35. Routley, Richard, and Meyer, Robert K. 1973. "Classical Relevant Logics I." *Studia Logica* no. 32:51-68.

"In a number of papers, the authors have offered semantic and algebraic analyses of the relevant logics of Ackermann, Anderson, and Belnap, and of logics akin thereto. The most interesting of these logics, in our opinion, are the Anderson-Belnap system R, which we analyzed in [1], and our own system B, studied in [5] and [6]. These are respectively the strongest and the weakest relevant logics, others being intermediate. Now one of the chief features of the relevant logics -- indeed, the chief feature on the motivational lines of [7], [8], and [1] -- lies in their blocking the so-called paradoxes of material and strict implication. The paradox which has drawn the most ink, particularly in Meyer's remarks, is the old saw that from a contradiction anything follows: i.e.,

(1) $A \& \neg A \rightarrow B$.

One would have thought, accordingly, that addition of (1), with other classical negation principles, to positive relevant logics would result in their breakdown, just as intuitionist logic fails to accomodate, on pain of breakdown, (1) together with excluded middle. Like so many things one would have thought, this is false. In fact, on a semantical analysis akin to that of [1] and [5] but in certain respect more natural as regards negation, the positive insights emerge unscathed. The purpose of this paper is to present that semantics and the *classical relevant logics* to which it gives rise. Arising out of this analysis are new algebraic insights as well; classical relevant logics are Boolean and so the algebras of these logics -- sufficing in particular for the positive parts of the relevant logics studied to date and in

distinction to the algebras developed by Dunn in [9] and by us in [6] -- are just Boolean algebras with an additional binary operation. Indeed, as we show, we may limit our considerations to *set algebras* -- i.e., algebras whose domain is the power set of some set. This leads to considerable simplification of some outstanding problems for positive relevant logics -- in particular, for the long-open decision question for R^{+--} and we suggest lines along which we believe a successful solution of this question can be obtained." (p. 51)

"Word that Anderson & Belnap had made a logic without semantics leaked out. Some thought it wondrous and rejoiced, that the One True Logic should make its appearance among us in the Form of Pure Syntax, unencumbered by all that set-theoretical garbage. Others said that relevant logics were Mere Syntax. Surveying the situation Routley, and quite independently Urquhart, found an explication of the key

concept of relevant implication. Building on Routley [1972] , and with a little help from our friends - Dunn and Urquhart in particular, with thanks also due to Anderson, Belnap, V. Routley, and Woodruff - we use these insights to present here a formal semantics for the system R of relevant implication, and to provide it with proofs of consistency and completeness relative to that semantics." (pp. 199-200)

(...)

"Our introductory remarks conclude with the observation that, as a result of this paper and of Urquhart's [1972] related work, the relevant logics now have a formal semantics; but relating such a semantics to the informal claim that a system of logic has captured one's intuitions is ever a matter of private judgment, and that judgment we leave, as his rightful due, to the reader." (p. 204)

"The purpose of this paper is to exhibit a simple, undecidable sentential calculus in the ANDERSON-BELNAP family of relevant logics. We call this system Q^+. We use the semantical methods of [1] and [3] to show that if Q^+ is decidable then the word problem for semigroups is solvable, contradicting POST's [2] and establishing our main result. Q^+, we add, is not our favorite sentential logic, but it is closely

related to the viable ANDERSON-BELNAP system R of relevant implication. Accordingly we believe to it be the best approximation yet to HARROP's request in [4] for a philosophically interesting undecidable sentential logic." (p. 389)

38. Routley, Richard, and Routley, Val. 1973. "Ryle's *Reductio ad Absurdum* Argument." *Australasian Journal of Philosophy* no. 51:125-138.

"According to Gilbert Ryle (in his *Collected Papers*) a certain sort of *reductio ad absurdum* argument, distinct from Euclid's argument, has a central place in philosophical argument. This *reductio ad absurdum* argument is applied in the following way: if it can be shown that an apparently meaningful thesis, such as that the mind is in the body, implies indisputable cases of absurdity, then the thesis itself is absurd (nonsense). Thus the argument is of the form: If q follows from p and q is absurd then p is absurd,

i.e., using some symbols,

if $p > q$ and $-Sq$ then $-Sp$ (1)

Throughout $p > q$ reads '(that) p entails (that) q' and $-Sq$ reads '(that) q is not significant (is absurd)'. But the notation may alternatively (by trading 'that' in for quasi-quotes) be read metalinguistically.

(...)

We want to argue here that there are grave difficulties in maintaining the correctness of the *reductio* argument (1), but that, fortunately for the project in *The Concept of Mind*, it is doubtful that the arguments used

there are in fact of this form or have to depend for their correctness on the correctness of (1). Once again the case for a special philosophical argument appears to fall down." (p. 125)

39. ———. 1973. "Rehabilitating Meinong's Theory of Objects." *Revue Internationale de Philosophie* no. 27:224-254.

"Meinong's theory of objects makes an important contribution to the logical theory and semantics of that large and indispensable part of discourse which is intensional. Despite this, his theory has been, and continues to be, the target for a barrage of supposedly devastating criticism and ridicule, which is without much parallel in modern philosophy, so that even to mention Meinong's theory gives rise to amusement, and practically any theory can be condemned by being associated with Meinong (e.g. 'shades of Meinong!' Ryle [1] p. 234; 'Meinong's jungle of subsistence,' 'the horrors of Meinong's jungle' [2] pp. 12, 32, 'the unspeakable Meinong', James cited in [3], p. 187. The effects of this have not merely been an historical injustice to a courageous and original thinker; it has also had the effect of blocking off, or at least inordinately delaying, a whole avenue of research, especially of non existential logic and of alternatives to the entrenched Russellian theory and its modern variations and simplifications. For the fact is that many of the more general objections which are supposed to destroy Meinong's theory would, if correct, be equally effective against non-existential logic, with which Meinong's theory shares important features. Our project of considering these objections has then wider importance than just that of clearing Meinong's name and rehabilitating his theory. In this paper we want to defend Meinong's theory of objects, or rather a modern logical reconstruction of a substantial part of it, against some of the common general objections which are taken to have completely discredited it. (Thus, e.g. Ryle [4]: *'Gegenstandtheorie* itself is dead, buried and not going to be resurrected'). We shall argue that these criticisms do not stand up to examination, and that it is not Meinong but his critics who are involved in a naive and mistaken theory of meaning, the Reference Theory." (p. 224)

40. ———. 1973. "Ideal Objects on a Meinongian Theory of Universals." In *Proceedings of the XVth World Congress of Philosophy Varna; 17th to 22nd September, 1973, Varna, Bulgaria. Vol. 5*, 581-584. Sofia: Sofia Press.

"The rejection of the Ontological Assumption (hereafter OA), according to which one cannot make true statement about what does not exist, together with the further step of admitting that non entities, i.e. items which do not exist, have determinate properties, makes it possible for a theory of items, such as Meinong's theory of objects, to avoid the standard positions on universal and many of their difficulties.

(...)

The rejection of the OA does not give a Meinongian position a merely terminological advantage or claim to novelty, nor does the position differ merely terminologically from Platonism (as the official positions are inclined to claim). The distinction is not merely terminological because the question of what exists is not completely uncontrolled by conditions: one cannot say what one likes about what exists. For to exist is to be in the actual world, and the logical properties of entities are controlled by those of the actual world. Hence these conditions which derive from the logical features of the actual world: - *first*, what exists is consistent; *second*, what exists is complete or determinate; and *third*, what exists is unqualifiedly assumptible, e.g. if the x which fs exists then the x which fs does

f. In short, in the case of an entity we do not require further guarantees about the suitability of its description: the guarantee is provided by its existence." (p. 581)

(...)

"Terms like ‘the Triangle’ and ‘triangularity’, and also mass terms, are irregular subjects. Accordingly there is nothing to be lost and much to be gained by admitting such subjects within the formal framework of quantification logic (see [3]). But once such subjects are admitted, and the domain of items in the semantical frame correspondingly widened, it is decidedly preferable to switch to a quantified significance logic to cope with the very large class of non significant sentences that result in typical applications of the logic. Then special postulates, each as part of (F), governing the new universal terms can be adjoined, but their exact form has still to be worked or argued out. Likewise a semantical rule for form terms, non trivial enough to verify the admissible half of requirement (F) (though not its converse, except under appropriately restricted conditions) remains, so far as we know, an open problem." (p. 584)

(...)

"Meinong's theory of incomplete objects is a going enterprise; but it has yet to be shown so far as I can see, if it can be shown

at all, that statements about Universals can always be eliminated, preserving relevant properties, in favour of hypothetical statements about 'ordinary' objects.

All we have been offered by those who would eliminate 'systematically misleading' statements about Universals (e.g. Ryle [3]) are sample eliminations, which however exemplify schemes such as (Q), which break down if applied generally. And it would appear to be an outcome of Ackermann's demonstration of the unsolvability of the elimination problem for second-order predicate logic (see [4], p. 304) that a general elimination of polyadic Universals in the proposed style is impossible." (p. 135)

"The purpose of this note is to extend the simplifications of [1] to the system R of relevent implication analyzed semantically in [2]. In [1], it was established that the system R +, which is the negation-free fragment of R, could be furnished with a negation ¬ more classical in most respects than the preferred negation — of [3].

This was rather astonishing, since an important motivating condition on relevant logics had been absence of the classical paradoxes of implication (1). It turned out, however, that one

could have the most objectionable of the paradoxes anyway, namely $A \,\&\, -A \rightarrow B$ and $A \rightarrow B \vee 7B$, without the least interference with the positive ideas." (p. 182)

(1) Other scholars, notably Urquhart and Gabbay, have thought independently about classical negation in relevant logics. But [1], so far as we know, contained the first demonstration that the system R + does not collapse under the admission of such negation." (p.183)

45. ———. 1974. "E is a Conservative Extension of E_i." *Philosophia* no. 4:223-249.

"The purpose of the present note is to solve the most recalcitrant of the conservative extension questions presented by Anderson for E in [1], by showing that E is a conservative extension of the system E_i, formulated as in [2]. The proof proceeds by reducing this question to the analogous question for the system NR introduced by the first author [Meyer](1) I in [3] and which was studied by us semantically in [4]. By showing that NR is a conservative extension of an appropriate system NR_i,, we complete the proof. The result is of interest, as was noted in [1], in that E_i is under more firm control that E, having been Gentzenized and furnished with a decision procedure in [2].(2) The method of proof, too, is of some interest, the most important part of the argument (in II below) lying in the replacement of truth-functional &, V with their intensional analogues -, + in adapting the characterization of [4] of theory and of prime theory in an appropriate completeness proof. One concludes that the point of view of [4], and of related papers, is

less dependent on properties of &, V - in particular, their general lattice properties - than one might have thought. Hopefully this will yield further insight into the semantics of E, which though in a sense completed in [6] and [7], remains too formally cluttered to be completely satisfactory.(3)." (p. 223)

(1) Bacon had the idea earlier, and independently. In principle it's due to Anderson and Belnap. And accordingly to Ackermann. And accordingly ... to Adam.

(2) We suppose, too, that E_i and NR_i have appropriate finite model properties on the present semantics, given the result of [10] that R_i has the finite model property.

For E and NR and R, on the other hand, these questions are open.

(3) In contrast, e.g., to R.

    "Many intensional logicians have not abandoned, as unrealisable, the dream of something like Leibniz's *characteristica universalis*, of an almost universal logical language, with simple components, and with a

    precise and acceptable semantics, within which the whole of (English) discourse can be expressed, and whose semantics provides theories of truth, consequence and meaning for the discourse expressed. Admittedly things did seem rather desperate when, after the initial successes of the pioneering days of Wittgenstein's *Tractatus Logico-Philosophicus* and Camap's *The Logical Syntax of Language* had faded, it was shown that the theories of these texts fail at point after point. However, most of the objections which were taken as winning the day against these theories - for example the inability of the theories to cope at all adequately with intensional discourse, with context dependence, with non-significance and other discourse failures - are now seen to rest on the paucity of the logical, and especially semantical, equipment then available, not in inherent limits to logic and semantical analysis.(1) make the dream a little more real then, both the logical syntax and the semantical framework will have to be much enriched.(2)

    Realising the dream involves however a very ambitious program. We don't pretend to know whether it can be brought off, or how exactly.

    But we do believe that if the program is to stand a chance of succeeding its logical theory will have to include enrichments like those we go on to discuss. These enrichments in turn however lead to many new problems, several of them

philosophical (and the regress in philosophical problems set up by technical solutions to earlier philosophical problems may well be vicious). We opt, in later sections of the paper, to concentrate on one important set of these problems, one which has a special bearing on the shape the grand semantics should take, the general admission of descriptions into intensional discourse, and of a choice descriptor in particular." (p. 291)

(1) This point is elaborated in [1], Chapter 4.

(2) Ideally these developments would be carried out in combination since, as Montague has emphasized (e.g. [2] p. 212), 'there will often be many ways of syntactically generating a given set of sentences, but only a few of them have semantic relevance'. Ideally - but there is a danger, in the current rudimentary state of semantical and context theory, that important notions, as well as discourse that cannot be properly digested by the theory, will be inadequately or roughly treated, if investigated at all.

    "It is a vogue idea that semantical analyses of natural languages such as English can be accomplished within the framework of a λ-categorial or type-theoretical language,(1) or of a language which can be included in such a λ-categorial language (e.g. Montague [7], Lewis [6], Parsons [8], Tichy [17], Cresswell[3]).

    The leading assumption are (1) that the surface structure or grammar of a given language can be transformed, or translated, by a series of reductions into a canonical form, commonly called 'deep structure', which is appropriately λ-categorial or as a special case thereof, categorial), and (2) that the semantic, which it is enough of course to furnish for the deep structure, is (some complication of) a two-valued possible worlds semantics. The assumed procedures is exhibited in a rudimentary way in the pedagogical practice of transforming English arguments into quantified modal logic as a preliminary to assessing validity, etc." (p. 327)

    "Much fresh light is cast on traditional metaphysical proposals, and on associated philosophical programmes designed to indicate or explain these proposals, by recent rapid advances in the areas of discourse which succumb to semantical analysis. Indeed, through semantical analysis various pervasive metaphysical proposals--which lie behind and thus propel modern philosophical programmes--can be conclusively demonstrated in appropriately qualified form, and the strength, limitations, and inadequacies of the more traditional forms can be revealed." (p. 187)

    (...)

    "The main thesis to be argued on this point is simply that *many philosophically influential reductive positions, when generously construed, furnish semantical analyses whose correctness can be demonstratively*

    established. In short, the *wide* reductions, taken as semantic analyses, are necessarily true, and thus reconcilable with transcendental positions.

    Where this is so the reductions furnished are not paradoxical, or wrong, but demonstrably correct, and not trivial, though sometimes virtually platitudinous. So results the promised synthesis.

What has generally happened, however, is that the reductions adopted are intended to work with a narrower reduction base which fits in with some cherished programme, such as empiricism. Under this contraction

of the base, the reductions cease to be demonstrable, and succumb to formal counter-examples and their more familiar intuitive analogues; and it is under these narrow construals that the reductions are paradoxical in Wisdom's sense.[*] But one important reason why the reductions are so appealing, a reason which Wisdom neglects, is that they rely on widened, correct, versions of the reductions where further situations are admitted into the analysis." 55. ———. 1976. "The Durability of Impossible Objects." *Inquiry* no. 19:247-250.

See the Reply by Karel Lambert (pp. 251-253).

"Meinong's theory of impossible objects, though an enduring contribution to semantics, has been subject to much misrepresentation and to repeated criticism, much of it based on Russell's criticism of the theory. Lambert, in an unusually sympathetic discussion of Meinong's theory argues that:

Russell's well-known argument fails. However, it is possible to augment Russell's argument against Meinong with sound Russellian principles in such a way that it presents at least a strong inclining reason against

Meinong's theory of impossible objects.(1)

The object of this note is to show that Lambert's 'augmentation of Russell's argument to show that there are at any rate no impossible objects' (p. 310) fails, and fails for essentially the reasons that Russell's well-known argument fails." (p. 247)

56. Routley, Richard, and Meyer, Robert K. 1976. "Dialectical Logic, Classical Logic and the Consistency of the World." *Studies in Soviet Thought* no. 16:1-25.

    Italian Translation: "Logica Dialettica, Logica Classica e Non-Contraddittorietà del Mondo", in Diego Marconi (a cura di), *La formalizzazione della dialettica*, Torino: Rosenberg & Sellier 1979, pp. 324-353.

    "Dialectical logic, especially Soviet logic, has customarily received sharp and summary treatment at the hands of Western critics.

    (...)

    To date classical logic - which is Western mainstream logic - has been strongly on the offensive in the ideological logical warfare between East and West, with many supporters in fact among the Soviets, and dialectical logic has been very much on the defensive. The object of this paper is to try to upset this ideological power structure by furnishing dialectical logic with the framework at least of a viable semantics, and at the same time to shatter the imperviousness of mainstream Western logic, and thereby to assist the cause of that newer, less orthodox and so far minor, logical theory - relevance logic.

    It will emerge that the differences between the orthodox Western and Soviet positions cannot be satisfactorily represented as logic, or formal or classical logic, on the one side, and anti-logic or the rejection of formal logic on the other; each position can furnish viable, equally formal, but competing logical theories, and the differences between these positions will come down to philosophical differences about such highly debatable and empirically untestable matters as the consistency of the world." (p. 1)

57. ———. 1976. "Every Sentential Logic has a Two-Valued Worlds Semantics." *Logique et Analyse* no. 19:345-365.

    "No one anywhere will design a sentential logic without a quite familiar kind of semantics, and no one can now scorn any such logic just because it lacks a semantics. For just as every

sentential logic has a characteristic Lindenbaum algebra, so, and less trivially, every such logic has a bivalent relational (and also an operational) semantics." (p. 345)

(...)

"But even if the models the method generates are sometimes skew, or even inconsistent, the method promises a big payoff not only in logic, but also for linguistics and philosophy. This payoff will be increased still further when the methods are extended to logics and languages far richer than sentential ones, as they can be (see [8]). Indeed the method presented below already suffices for all zero-order logics under a truth-valued interpretation; but for an objectual semantics further features have to be included in the models (see [10]). We conjecture that every logic has a two-valued worlds semantics ; but there remain some conspicuous problems in the way of proving such a result, e.g. the problem of characterising logics and logical languages generally. The logical payoff comes through the theories and results semantical analyses of logics and languages open up, for example, theories of truth, reference, meaning and consequence, and, less generally, results such as compactness, separation and decidability. The philosophical and linguistic pay-off derives from this logical payoff: it is that any area of language that can be supplied with an exact logical syntax and set of principles can automatically be furnished with an extensional semantics, and so provided with associated logical theories of truth, meaning, consequence and so on. If, for example, the theory of propositional attitudes or notions such as belief or perception have a logic, or a structure, then they have a worlds semantics." (p. 347)

Journal of Formal Logic no. 17:44-58.

"Algebraic techniques are used to show that Feys' system S2° (cf. [1]) and certain necessitated extensions of S2°, such as Lewis' systems S2 and S3, have the finite model property, and accordingly are decidable.

Representation theorems are then used to establish set-theoretical semantics for the modal systems studied. Where the results obtained are not new they improve on earlier results (such as those of Lemmon in [3]) in two respects; first they provide direct algebraic treatments of the systems, and second they furnish better semantical results (see the discussion of theorem J for S2). The techniques used however follow those of McKinsey (in [4]) and Lemmon (in [2] and [3]). Since it is now known that these techniques do not work for all necessitated extensions of S2°, a somewhat piecemeal approach is inevitable. Weak results are also obtained for Feys' system Sl° and Lewis' system SI (for details of these systems see [1])." (p. 44)

59. Routley, Richard. 1977. "Meaning as Semantical Superstructure: A Universal Theory of Meaning, Truth and Denotation?" *Philosophica (Belgium)* no. 19:33-67.

"It is one thing to give a general theory of or semantics for truth, or even for truth and significance, and thereby provide for the main ingredients of a full theory of referential (or denotation style) notions. It is quite another, so it is commonly enough claimed (following Quine [1]), to characterise any of the

notions of the full theory of meaning - synonymy, sense, entailment, and so forth. The extent to which this popular dogma - one of the newer dogmas of empiricism - is correct, is an issue even within empiricist semantics." (p. 33)

(...)

"Because intensional discourse has to be encompassed in the theory of truth, the general semantical framework of a satisfactory theory has to include worlds far beyond the actual, or the like. But in including these - especially impossible worlds, which are essential for example, for the semantical analysis of propositional attitudes such as belief (see [14]) - it far exceeds what is empirically admissible. By including these

worlds, however, the *full* theory of truth offers a framework for definitions of central intensional notions, such as meaning: but a less extensive modelling, with worlds restricted to the actual or to those of modal logics, would *not* suffice." (p. 36)

"Weak strict modal logics, strict modal logics which are weaker than systems which contain the rule of necessitation (that where *A* is a theorem so is its necessitation, □A), form an important, but somewhat neglected and under-rated, class of modal logics. They have, however, attractive semantics which form an integral part of general semantics for modal logics. A sentential *modal* logic is a system which includes as well as classical sentential logic *SL*-taken to hold at *every* world-at least one oneplace non-truth-functional connective, □ say.

Semantics for sentential modal logics are a special case of the universal semantics of [4], with the rules for classical connectives reducing to classical evaluation rules (such as Iii) and Iiii) below). With just one further modelling condition, a natural semantics for weak strict modal systems emerges. Semantics for such systems are, of course, far from uniquely determined." p. 497)

66. ———. 1977. "Extensional Reduction I." *The Monist* no. 60:355-369.

"Philosophers of modern logic have cherished no project more dearly than that of extensional reduction. Despite occasional protests that this project was ill-conceived from the start, or that it fails to account for important areas of experience and thought, the extensionalist mills have been grinding away anyhow. Their grinding has brought with it a number of important technical successes, replete with philosophical claims that light has finally been shed on areas hitherto buried in incomprehensible darkness.

There has, frankly, always been something self-serving about these claims. A man who understands no language but French will find nothing comprehensible until it has been translated into French. This does not mean, surely, that Shakespeare reads better in French than in English. It means rather that those who are unwilling to make the effort to comprehend Shakespeare in his native linguistic habitat will have to make do with what can be preserved of him in a foreign language.

Nevertheless, the fruits of the project have been impressive. Nor is there any doubt that some areas?e.g., Lewis-style modal logics?have been rendered, if not necessarily more intelligible, at least simpler and closer to what one took to be an underlying philosophical motivation?e.g., by Kripke-style possible world analysis.

So, in short, it seems good to us to have another look at the entire program of extensional reduction. We shall ask in particular whether successful extensional reduction should be taken as a touchstone of good semantical analysis. Relevant to this question will be certain technical results to be newly presented here." (p. 355)

Annotated bibliography of the logical works of Richard Sylvan [*né* Routley] (1978-1988)

Bibliography

1. Routley, Richard. 1978. "Semantics for Connexive Logics I." *Studia Logica* no. 37:393-412.

   "According to the third view in the ancient debate on the nature of conditionals,[*] a sound conditional requires a connexion between antecedent and consequent. Both material implication (the first ancient view} and

   strict implication (the second ancient view) were rejected by the third view as satisfactory accounts of the conditional relation because they deliver conditionals such as those of the paradoxes of implication which

   are unsound, presumably on the ground that they fail to meet the requirement of connexion. We do not know what conditionals were said to meet this requirement, other than Identity, A → A (a principle that was explicitly rejected under the fourth ancient view).

   The third ancient view has reappeared in the modern debate as to the nature of entailment, implication and conditionality, where the connexion requirement is commonly imposed as a requirement of meaning

   or content connexion between antecedent and consequent of valid implications. This requirement coincides with the broad

requirement of relevance: for if antecedent and consequent enjoy a meaning connexion then they are relevant in meaning to one another, and if they are relevant in meaning to one another then they have through the relevance relation a connexion in meaning." (p. 393)

(...)

"Although the semantical analysis resolves many problems concerning connexive logics and provides new means of attacking other problems, it leaves many problems - perhaps too many - open." (p. 410)

2. ———. 1978. "An Inadequacy in Kripke-Semantics for Intuitionistic Quantificational Logic." *Bulletin of the Section of Logic* no. 7:61-67.

"The semantics for intuitionistic quantificational logic, that have come to be known as Kripke-semantics (see, e.g., [2], p. 246) after the influential presentation of Kripke [1], turn out to be unsound. Since a large body of theory concerning intuitionistic logics and mathematics is now based on these semantics the matter is of more than merely local significance.

Although the points made apply equally against many other presentations of Kripke-semantics for intuitionist logic (e.g. those of Thomason [3], Aczel [4], Gabbay [5] and elsewhere), it is convenient to focus on Kripke [1], and to borrow his terminology and notation. Kripke in turn adopts (see [1], p. 93) the formulation of intuitionistic predicate logic of Kleene [6], and it is advantageous to follow suit. It is worth noting that Kleene's formulation allows both for free variables and for constants (and so also do the formulations adopted by some others: e.g. Thomason [3], p. 1 and Aczel [4], p. 2)." "In his original presentation of The System of Strict Implication ([1], chapter V) Lewis considers a `partial system contained in Strict Implication' to which he believes some interest attaches.

If our aim be to create a workable calculus of deductive inference, we shall need to retain the relation of logical product, p & q, but material implication, $p \supset q$, and probably also material sum, $p \vee q$, may be rejected as not suffciently useful to be worth complicating the system with. The ideas of possibility and impossibility also are unnecessary complications. Such a system may be called the Calculus of Ordinary Inference ([1], p. 318; with modern notation for connectives." "Systems in the vicinity of the ***P*** systems, first formulated by Arruda and da Costa [1] (1) are logically important, for several reasons. Firstly, it is evident that a naive set theory with an unrestricted comprehension axiom, designed with certain of these systems as underlying logic, will prove to be a non-trivial though inconsistent theory (2). Thus, as remarked in effect in [1], these systems offer important initial bases on which to endeavour to erect mathematically adequate paraconsistent set theories." (p. 301)

(1) Da Costa's use of ***P*** systems, and also of other systems than his *C* systems, was quite unfairly neglected in [8], where it was suggested that da Costa, though having the fine vision of a general theory of inconsistent or (as they are now called) paraconsistent systems, had concentrated on much too narrow a range of systems.

But a theory of sufficient generality of paraconsistent systems -- as distinct from the investigation of just a few systems of the class -- has yet to be worked out.

(2) Inconsistency is readily established by paradox arguments, e.g. by the standard argument for the Russell paradox. The intuitive argument which makes non-triviality evident is as follows: - - It is known from [2] that an extensional comprehension axiom can be added to quantified ***P*** systems without trivialising them, that is one can non-trivially adjoin a comprehension axiom limited only by the requirement that set determining wff contain but extensional connectives and quantffiers, i.e. in this context, contain no occurrences of the implicational connective →. But, as the semantics will show in the case of appropriate ***P*** systems such as ***BH***, no reduction of nested implication can be effected in these ***P*** systems; thus even if implicational connectives should occur in set determining wff they cannot be utilised, they are effectively locked away in the set determining wff. Hence, intuitively at least, an unrestricted comprehension axiom can be added to appropriate ***P*** systems without trivializing them.

A proper demonstration of the non-triviality of naive set theory based on appropriate ***P*** systems can, it appears, be obtained enlarging on the persistence methods of [2], by adding world by world variation to the modelling that establishes the non-triviality of extensional dialectical set theory. Such a proof is made easier by the simplicity, surprising in view of [3], of the semantics for appropriate ***P*** systems. Da Costa and

Arruda have apparently devised a different demonstration of the non-triviality of ***P*** with unrestricted comprehension.

9. Routley, Richard. 1979. "The Theory of Objects as Commonsense." *Grazer Philosophische Studien* no. 9:1-22.

"It is beginning to be appreciated that the Meinong of the mainstream philosophical literature is a mythological figure, that Meinong's philosophy has in fact been presented in an unfair fashion (perhaps even by largely sympathetic expositors such as Findlay [2]), and that the theory of objects in particular has been either widely misunderstood or else deliberately misrepresented. What has not been much appreciated is that Meinong's theory of objects represents an important alternative to standard (Russellian) logical theory.(1) Whereas the entrenched theory is both reductionist and logico-empiricist in spirit, the alternative is nonreductionist, antiverificationist, and commonsense. Since the theory of objects has often - there are, however, important exceptions - been taken to be the very antithesis of commonsense, there is some explaining to be done. The problems are compounded by the fact that it is not at all easy to say what commonsense amounts to, and even more difficult to show that a philosophical theory is a commonsense one." (p. 1)

(1) There need be no apology for calling modem, standard, orthodox, "nondeviant", "classical" logic 'Russellian'. The orthodox logic of the textbooks consists essentially of variations and improvements (or sometimes the reverse) on the logical theory devised in large measure by Russell, building on the work of Peano and others, and worked out in collaboration with Whitehead in *Principia Mathematic*a [5]. Certainly there have been important additions by Hilbert, Wittgenstein, Tarski, Gentzen and others but these do not affect the general claim. In these terms influential modem logical theories, such as those of Quine

[15], are but variations on a theme of Russell's. And they share the reductionist empiricist assumptions of Russell's logical theory.

11. ———. 1979. "Dialectical Logic, Semantics, and Metamathematics." *Erkenntnis* no. 14:301-331.

"As with the thesis that God exists, so with the Consistency Hypothesis that the world is consistent, there are three main positions that can be taken; namely, a theistic or classical position which accepts the hypothesis, an agnostic or relevant position which suspends judgement, and an atheistic or dialectical position which rejects the hypothesis. (1) Here the world is Wittgenstein's world, the real or actual world of intensional semantics, that is the class T of all truths, and the Consistency Hypothesis, CH, is the thesis that T is simply consistent, that it contains no contradictory pairs of the form A and ~ A, where ~ A is the negation of A. T, whether consistent or not, by no means exhausts the class of statements; for it is an empirical truth that the world is not trivial, that not all statements are true. Neither relevantly nor dialectically, however, does inconsistency lead to triviality; to assume, as classically, that it does is to assume the matter at issue, for the assumption is tantamount to CH (as [1]) explains)." (p. 301)

(...)

"The remainder of this paper endeavours to contribute something further to the discernment of such a dialectical

theory, to circumscribing its underlying static logic and furnishing its semantics, to establishing its

adequacy, and to outlining certain of its applications in mathematical and foundational studies." (pp. 302-303)

(1) 1 Whereas in [1] adoption of the relevant position was argued for as the rational course of action, in [3] and [11] the dialectical position is defended. The case for the shift from the agnosticism of 1973-1974 to atheism is explained in [3]. [1] and [11] are desirable background reading for the present paper.

12. ———. 1979. "Alternative Semantics for Quantified First Degree Relevant Logic." *Studia Logica* no. 38:211-231.

Abstract: "A system ***FDQ*** of first degree entailment with quantification, extending classical quantification logic ***Q*** by an entailment connective, is axiomatised, and the choice of axioms defended and also, from another viewpoint, criticized. The system proves to be the equivalent to the first degree part of the quantified entailment system ***EQ*** studied by Anderson and Belnap; accordingly the semantics furnished are alternative to those provided for the first degree of ***EQ*** by Belnap. a worlds semantics for ***FDQ*** is presented, and the soundness and completeness of ***FDQ*** proved, the main work of the paper going into the proof of completeness. The adequacy result is applied to yield, as well as the usual corollaries, weak relevance of ***FDQ*** and the fact that ***FDQ*** is the common first degree of a wide variety of (constant domain) quantified relevant logics. Finally much unfinished business at the first degree is discussed."

13. ———. 1979. "The Semantical Structure of Fictional Discourse." *Poetics* no. 8:3-30.

"An attempt is made to account for the evident truths supplied by fictional discourse, and to vindicate the ordinary naive theory of fictions, within the single framework of universal semantics and the theory of objects. The theory offered is an elaboration of a contextual theory (which tits easily into universal semantics) according to which the context supplies base-shifting functions which alter the world where truth is assessed. The elaboration consists, firstly, of expansion of the theory of contexts to meet various objections, and, secondly, of deployment of the theory of objects to account for truths concerning fictional objects in non-fictional contexts (as regards the second, various options open on the contextual theory are sketched; but an important option the author now prefers is omitted).

An account is given of fiction and its distinctive semantical features. A work of fiction is regarded as portraying part of a world, so a work of fiction is semantically like a theory. Since there is little restriction on the worlds of fiction, any modal theory of fiction is bound to be inadequate; there is in fact no general uniform logic of fiction. (This corresponds to the unrestricted imagination thesis, fundamental to a comprehensive theory of fiction, to the effect that there are no restrictions on what is imaginable.) Also criticised and rejected are other theories of fiction such as elliptical and dimensional theories.

Not only the statements of fiction but the objects of fiction are considered. The worst logical difficulties concerning the objects of fiction are resolved, so it is argued, by adopting a neutral quantificational framework and by sharply qualifying the Leibniz identity principle.

That the same object, e.g. London, occurs in a given fictional world as in the actual world is a matter of qualified author say so; transworld identity is *here* stipulative. The final points concern the incompleteness and fictionality of the theory developed." (p. 3)

14. Routley, Richard, and Griffin, Nicholas. 1979. "Towards a Logic of Relative Identity." *Loguique et Analyse* no. 22:65-83.

    "Identity statements in natural language come in two syntactic varieties. Some are of the form '*a* is the same as *b*' or '*a* is identical with *b*' and may be symbolized, after the manner of classical identity theory, as '$a = b$'. These will be called absolute identity statements. Others have the form '*a* is the same Φ as *b*' where 'Φ' is some general noun. Statements of this form will be called relative identity statements and will be formalized (following Wiggins [1], p. 2) as '$a =_{\Phi} b$'. In such statements 'Φ' is called the covering concept of the identity statement." (p. 65)

    (...)

    "Two theses are of central concern in considering relative identity. The first is the claim (R) that two items may be the same with respect to one general noun but distinct with respect to another; the second is the claim (D) that absolute identity statements are semantically incomplete." (p. 66)

    (...)

    "In this paper we propose (roughly in order of increasing plausibility) a variety of logics for relative identity theories of the first and second types, that is, theories with both (D) and (R) and theories with (R) but not (D). In doing this we refute two claims about relative identity which have gained currency: firstly, the claim made by Nelson [1] and Ayers [1] that identity theories in which (R) is satisfiable are incoherent; secondly, the claim, implied by Wiggins [1], p. 27, that (R) entails (D). In the case of each theory proposed, the satisfiability of (R) can be demonstrated by adding to the theory appropriate constants which can be used to form an example of (R)." (p. 67)

15. Routley, Richard, Meyer, Robert K., and Dunn, Jon Michael. 1979. "Curry's Paradox." *Analysis* no. 39:124-128.

"In short, the conclusion of our examination of Curry's paradox is discouraging in the extreme for the hopeful naive set theorist. One sought to avoid the problems posed by Russell by weakening logic, in order to save the abstraction principle. We were willing to give up the usual aversion to contradiction. We faced with equanimity the sacrifice of the deduction theorem. To continue with the project, a minimal, decent respect even for *modus ponens* must be given up as well.

We have always held that, in these permissive days, no rule is sacrosanct--except *modus ponens*. And one may, of course, still cleave to the *rule* of *modus ponens* without the *modus ponens* axiom; indeed, Routley

has conjectured that a naive set theory based on a very weak relevant logic is absolutely consistent. One might look for other escapes, too; e.g., the role of the '↔' in the abstraction principle above might be

reexamined. But the conclusion is none the less clear; unless we are prepared to give up a great deal of logic--not only of classical logic but of intuitionist and even relevant logic as well-a naive set theory is

untenable." (p. 128)

16. Routley, Richard, and Routley, Val. 1979. "The (Logical) Importance of not Existing." *Dialogue* no. 18:129-165.

"An adequate theory of meaning and truth is semantically important. Such a theory necessarily includes in its analysis nonentities, items that do not exist. So what is semantically,

and hence logically, important is bound to include nonentities. In virtue of the modifier 'semantically', the first premiss is analytic (what is semantically important may not be important), and it is comparatively uncontroversial. By contrast the second premise of the syllogism, which we want to stick to, is decidedly controversial. So too is the thesis (advanced in [2] and [3] and in Chisholm [15]) - which implies the inadequacy of classical logical theories - that there are a great many natural language statements, statements an adequate theory should be able to treat of, which cannot be analysed logically, and semantically, without the equivalent of an appeal to nonentities. Defence of the thesis has been somewhat piecemeal, taking the form that all the theories so far offered which try to dispense with nonentities break down or run into insuperable difficulties, difficulties which are readily surmounted given appropriate talk about nonentities. In what follows we shall outline more general sorts of argument for the thesis, designed to show that no theory which dispenses with nonentities as objects of discourse can do justice to the data.

The thesis of the inadequacy of classical logical theory, basically one of Meinong's theses expanded and dressed up in more modern attire, has not exactly won widespread acclaim, but it has gained some notoriety and has encountered much opposition.

Much of what follows is an attempt to counter some of that opposition; to reinforce the claim that classical theories break down irreparably over the analysis of intensional discourse concerning nonentities; to meet the objection that objectual semantics for Meinongian-style theories of objects have themselves serious flaws; to refute the view that Meinongian theories have no philosophical advantages, only drawbacks; and to show, by way of illustration of the importance of nonentities in solving traditional philosophical problems, how the theory of objects, and only such a theory, can resolve many problems in epistemology, problems in fact generated by the classical theory." (pp. 129-130)

"A fundamental error is seldom expelled from philosophy by a single victory. It retreats slowly, defends every inch of ground, and often, after it has been driven from the open country, retains a footing in some remote fastness (Mill *A system of logic*, pp. 73-4).

The fundamental philosophical error, common to empiricism and idealism and materialism and incorporated in orthodox (classical) logic, is the Reference Theory and its elaborations. It is this theory (according to which truth and meaning are functions just of reference), and its damaging consequences, such as the Theory of Ideas (as Reid explained it), that noneism - in effect, the theory of objects - aims to combat and supplant. But like Wittgenstein (in *Philosophical Investigations*, and unlike Mill, noneists expect no victories against such a pervasive and treacherous enemy as the Reference Theory. Though noneists take it for granted that 'Truth is on their side', and reason too, the evidence that 'Truth and reason will out' is exceedingly disappointing. Nor do they expect the enemy to vanish, even from open country: fundamental error will no doubt persist, to the detriment of philosophy, and of every theoretical and practical subject it touches. For there is great resistance to changing the framework (to amending the paradigm); so there is an attempt to handle everything within the prevailing philosophical frame. There is no need, it is thought, to change the framework, all problems can eventually be solved within the basic referential scheme - at worst by some concessions (1) which absorb some nonreferential fragments, and thereby decrease both the level of dissatisfaction with the going frame, and the prospects for perception of its real character.

The faith that the Reference Theory (and its forms such as extensionalism and empiricism) will find a way out of its

impasses, a way to deal adequately with nonexistence and intensionality, is like the faith that technology will find *a way* to deal with social problems, especially with all the problems it creates (the faith is deeply embedded in the Technocratic Ideology). As with the Technocratic Ideology so with the Reference Theory, the Great Breakthrough which will resolve these problems, (patently) not soluble within the technological or referential framework, is always just around the corner, no matter how discouraging the record of failures in the past. The problems, difficulties, and failings of the Theory are not recognised as reasons for rejecting it and adopting a different theoretical-and ideological framework, but are presented as 'challenges', which further work and technology will doubtless find a way to resolve. And as with Technocracy the 'solution' of a problem in one area is liable to create a rash of new problems in other areas (e.g. increasing energy supply at the expense of increased pollution, forest destruction, etc.), which can, however, for a time at least, be conveniently overlooked in the presentation of the 'solution' as yet another triumph for the theory and its ideology. That is, the procedure is to trade in one problem for another, and hope that nobody notices.

The basic failings of the Reference Theory are at the logical level. The Reference Theory yields classical logic, and directly only classical.

An example of theoretical cooption is the (somewhat grudging) toleration of lower grades of modality and intensionality - which can however be referentially accounted for, more or less.

The basic failings of the Reference Theory at the logical level.

The Reference Theory yields classical logic, and directly only classical logic: in this sense classical logic is the logic of the Reference Theory. An important group of elaborations of the Reference Theory correspond in the same way to logics in the Fregean mode. Accordingly with the breakdown of the Reference Theory and its elaborations all these logics fail; and so, as with the breakdown of modern energy supplies, substantial adjustment and reconstruction is required. In fact no less than the effects of a logical revolution are called for (see

Relevant logics and their rivals), though the aim of these essays is to achieve such results in a more evolutionary way, to take advantage of the classical superstructure, to build the new logic in part on what there is. The logical areas where change and improved treatment are especially, and desperately, needed are these:

nonexistence and impossibility;

intensionality;

conditionality, implication and deducibility;

significance; and context.

It is on the first two overlapping areas, the very shabby treatment of which is a direct outcome of the Reference Theory, that the essays which follow concentrate. (The remaining areas - which are, as will become quite evident, far from independent - are treated, still in a preliminary way, in two companion volumes to this work, *Relevant logics and their rivals* and *The logic of significance and context,* and in other essays.) When the Reference Theory and its elaborations (such as Multiple Reference Theories) are abandoned the role of logic changes - its importance need not however diminish." (Preface, I)

(1) An example of theoretical cooption is the (somewhat grudging) toleration of lower grades of modality and intensionality - which can however be referentially accounted for, more or less.

18. ———. 1980. "Problems and Solutions in the Semantics of Quantified Relevant Logics. I." In *Mathematical Logic in Latin America: Proceedings of the IV Latin American Symposium on Mathematical Logic held in Santiago, December 1978*, edited by Arruda, Ayda Ignez, Newton da Costa, Carneiro Affonso and Chaqui, Rolando Basim da, 305-340. Amsterdam: North-Holland.

    Abstract: "The main problem investigated is the adequacy of constant domain relational world semantics for quantified relevant logics. The problem is solved, though in a disagreeably circuitous way, for many weaker relevant logics, and an outline

of how the solution may be extended to stronger logics such as RQ is given.

Alternative necessity and intensional conjunction style rules for the evaluation of quantifiers are studied and shown to simply force the main problems above with the usual (extensional conjunction style) quantifier- rule to reappear, unmitigated, at alternative outlets. Finally some philosophical problems allegedly engendered by constant domain world semantics are examined briefly: it is argued that the "problems" are no problems."

19. ———. 1980. "The Choice of Logical Foundations: Non-Classical Choices and the Ultralogical Choice." *Studia Logica* no. 39:77-98.

    Abstract: "A multiple factor model for choice of best objective (which generalises on the modellings of optimisation theory, and so enables the unification of much decision theory) is developed. Essentially the recipe is to maximize a given function of expected values of the factors subject to a set of constraining relations on the factors and to overriding constraints (the constraining relations are not restricted to certain relations of equality and inequality). The model, which was designed to apply in environmental decision-making situations, has an important role in value theory and in the theory of choice of theories, and it specialises to the matter of choice of logical foundations.

    It is argued by way of a series of actual examples that the limited quantifiability or nonquantifiability of the factors does not count against realistic applicability of the model. The factors and constraints in the special case of best choice of logical foundations (for the full range of logical purposes) are sketched and discussed. Important factors are those of scope and applicability to the data. other nonnegligible factors

    are such pragmatic factors as simplicity, economy, power, intelligibility, fruitfulness.

    In addition to constraints between the factors there is a major overriding constraint, namely that of conformity to the facts.

The theoretical model is applied. First a criticism of other accounts of choice, especially pragmatism, and consistency criteria, is mounted. It is then argued, applying the account of best choice el logical foundations for discourse (including philosophical discourse) that has emerged, and making heavy use of factual constraints, that the choice to make is not a choice of classical logic, not a choice of some extension of

classical logic, but choice of a paraconsistent logic, and among such essentially nonclassical logics, of an ultralogic, i.e. of a relevant inexistential highly intensional logic."

Paul Weingartner gewidmet*, edited by Morscher, Edgar, Neumaier, Otto and Zecha, Gerhard, 97-118. Bad Reichenhall: Comes Verlag.

    Reprinted in *Synthese*, vol. 173, 2010, pp. 107-122.

    Abstract: "The paper seeks a perfectly general argument regarding the noncontingent limits to any (human or non-human) knowledge. After expressing disappointment with the history of philosophy on this score, an argument is grounded in Fitch's proof, [*] which demonstrates the unknowability of some truths. The necessity of this unknowability is then defended by arguing for the necessity of Fitch's premise—viz., there this is in fact some ignorance."

    "Consider some thing, d say, that does not exist, for example d is Meinong's round square. Then what does not exist is in this case d; but it in no way follows from "d is non-existent" that "d exists". Such nonentities as d need have no being in any sense. It is basically because whatness and thinghood have been illicitly restricted to what exists or has being, that a puzzle seems to have arisen: for certainly we contradict ourselves if we say that what has being does not have being. There is no contradiction however in saying that what is a thing or object, e.g. d, may have no being in any sense; and this dissolves what Quine nicknames *Plato's beard*, without using or blunting, Occam's razor. For Occam's razor to remain sharp requires only that entities not be multiplied beyond necessity; but no multiplication of entities has been made, no bloating of the universe (of what exists) has occurred. Indeed the theory of objects enables a very substantial reduction in what is said to exist, so that what is said to exist can coincide with what really does exist, namely only certain individual objects now located in space.(4) But, more to the point, Occam's razor embodies various muddles of the very sort that it is important to remove. In particular, Occam's dictum that entities [or differently, objects] should not be multiplied beyond necessity supposes that it is in our power to increase or decrease the number of entities [or objects]: but of course in *that* sense - as opposed to the destruction or creation of objects by one's activity - it is not. What we can increase or decrease is not what exists but what we *say* exists, what we (choose to) *talk about*, and what our theories commit us to in one way or another. So the dictum, and a use like Quine's of it, confuses what exists with what we (choose to) talk about or what we, or our theories, *say* exists - a confusion that runs through into recent criteria for ontological commitment, themes of ontological relativity, and programs for ontological reduction." (pp. 152-153)

(4) It was Meinong's thesis that any existing object has a more or less definite location in space and time. It is a corollary that abstract objects do not exist (see further [2], chapter 9).

"This volume is primarily a logical and semantical investigation of an extensive class of zero-order intensional logics, i.e. of intensional logics which do not include variable binding devices such as abstraction operators, descriptors, quantifiers or their equivalents. The effect of adding variable binding devices will have to be reserved for another volume. Many of the philosophical investigations and issues which are presupposed by or arise from this predominantly formal study will, we still hope, appear in yet other publications (e.g. *Beyond the*

Possible, long in preparation). The separation of these matters is admittedly deplorable (whether the proposed multiplication of book-entities is also deplorable will be left for readers to decide). The exclusion of quantifiers and descriptors deprives the logics of some of their interest and usefulness in the analysis of natural languages and philosophical and other argumentation, and the partial exclusion of intimately connected and motivating philosophical issues is artificial and weakens the case for such a detailed study of particular intensional logics. However this volume is evidently long enough already.

Relevant and irrelevant logics. We focus on those intensional logics that, satisfying weak relevance principles, have become known as relevant logics. The class of sentential logics that satisfy weak principles of relevance is however wide and includes many logics which are, in principle, rivals to the position(s) we shall be advancing.

We want it to emerge with stark clarity, however, that our main concern is not really relevance at all - the appropriate sort of relevance is a byproduct of any good implication relation, which comes out in the wash. Only one weak necessary condition for relevance features in what follows: that is all'. A study of relevance, of the sorts of relevance, of sufficient conditions for relevance, ... - all these matters are philosophically interesting, and some of them are important, especially for the logics of evidence and probability - but they are not our present concern. For this reason the name 'relevant logics', or 'relevance logic', is not entirely satisfactory - perhaps even, to lodge a much stronger claim, unfortunate - since the name tends to suggest, wrongly, that relevance is of the essence, instead of being a peripheral concern. Nonetheless the name has a point, and it is a little late to change it.

What our concern is with is implication and its varieties, and in particular with genuine implication in the sense that amounts to total sufficiency. Thus our concern is, in the first place, with sufficiency, or, as it is otherwise equivalently put in the logical case, with complete logical dependence, with total inclusion of

logical content, and so on. Implication is not confined however to logical implication or deducibility; we are very much interested in having our systems apply to other sorts of sufficiency, physical or law-like sufficiency in particular, and to provide the bases, in enthymematic ways, for analyses of partial sufficiency, for instance for insufficiency conditionals - for conditionals, for example, which are obtained from genuine sufficiency conditionals by suppression of true or necessary antecedents (or, symmetrically, of false or impossible consequents). This will take us back through the usual logics of the textbooks, to intuitionistic logic and modal logics, and, in the extreme case, to classical two-valued logic. (p. X)

26. Routley, Richard, and Plumwood, Val. 1982. "Negation and Contradiction in Wittgenstein." In *Sprache und Ontologie. Akten des 6. internationalen Wittgenstein Symposiums 23. bis 30. August 1981, Kirchberg/Wechsel (Österreich)*, edited by Leinfellner, Werner, Kraemer, Eric and Schank, Jeffrey, 471-474. Wien: Verlag Holder-Pichler-Tempsky.

    "In the earlier work, especially the Tractatus, the classical explosion model of negation is adopted; negation is represented as total exclusion. There has, of course, to be more to the account of negation than this. In particular, logical constants such as negation, since they would otherwise raise serious difficulties for the picture theory of meaning, call for special treatment, which they obtain through the theory of math-functions. Negation is simply such a classical function; nothing in reality corresponds to it." (p. 471)

    (...)

    "A cancellation view, incompatible with the classical model of the Tractatus, is infiltrated in subsequent work. A cancellation picture is already deployed in transitional work, e.g. ‘the rules of Euclidean geometry don't contradict one another, i.e. no rule occurs which cancels out an earlier one (p and ~ p), , ,’ (*PG*, p. 345). It is a cancellation picture, where contradictions have no content and say nothing (and so are useless), that lies behind Wittgenstein’s assumption that one should not draw any conclusions from a contradiction (*LFM*, p. 220), or better, that

a way should be found of not proceeding from a contradiction (*LFM*, p. 223).10 Furthermore, many of the pictures and images of negation Wittgenstein later considers are of a cancellation type or can be adjusted to fit a cancellation model. Although Wittgenstein repeatedly alludes to such images, at the same time he depreciates them (e.g. all attempts to explain why a contradiction "won't work" are spurious, *LFM*, p. xviii): they are all said to convert to no more than substitution of one symbolism for 'another. Even so, such things can have an explanatory and modelling role. Wittgenstein suggests not, because all that is offered is symbolism and figure, so the question of 'how one is going to use it?' (*LFM*, p. 181) remains, since any picture can be used in several ways. He goes on to advance the even more dubious description theme that 'anything which we give and conceive to be an explanation of why a contradiction does not work is always just another way of saying that we do not want it to work' (*LFM*, p. 187).

The assumption that contradictions don't, or won't, work and associated themes, e.g. that contradictions are useless, and associated images, e.g. the jamming picture (*LFM*, p. 178—9, ascribed to Moore, p. 190), are 'all connexivist in cast. With a contradiction, as when the cogs join, nothing emerges, 'we cannot do anything with it' (*LFM*, p. 191). It is from the same cancellation model that the no-content thesis, which jamming depicts, derives, that contradictions do not say anything, a thesis also equivalently (but misleadingly) expressed in 'contradictions don't make sense'.

The cancellation view can be included in the relevant synthesis by appeal to abnormal worlds or language-games, games where contradictions do stop proceedings, and where A & ~A may have no content. But in assuming, as he often appears to, that games are restricted to those that are classical (effectively, in P) or those that are of a cancellation type (in a subclass of W-K), Wittgenstein much too drastically delimits the games, or worlds, needed in giving a full account of negation. And in assuming that abnormal cancellationtype games are characteristic—*'that* we exclude the contradiction and don't normally give it a meaning is characteristic of our whole use of

language' *(LFM*, p. 179)—Wittgenstein goes curiously astray. Commonly we do not treat contradictions in this way. We reason on the basis of them (e.g. in reductio arguments), we act on the basis of inconsistent information (cf. the general who acts, and succeeds, on the basis of contradictory reports, *LFM*, p. 105), and we exploit paradoxes when we can." (p. 474)

27. ———. 1982. "The Inadequacy of the Actual and the Real: Beyond Empiricism, Idealism and Mysticism." In *Sprache und Ontologie. Akten des 6. internationalen Wittgenstein Symposiums 23. bis 30. August 1981, Kirchberg/Wechsel (Österreich)*, edited by Leinfellner, Werner, Kraemer, Eric and Schank, Jeffrey, 49-67. Wien: Verlag Holder-Pichler-Tempsky.

"In contrast to empiricism the historical alternatives of (traditional) rationalism, Meinongian rationalism, mysticism and idealism are alike in their rejection of what we have selected as the most important characterising thesis of empiricism, that the world can be adequately accounted for or explained just in terms of what exists, in terms of the actual (referential) world *G*.

Meinongian rationalism has a modern logical expression in noneism, the theory of items elaborated elsewhere (especially in Routley (1979)). The core theses of noneism include the following:—Every (significant) singular term signifies an object, i.e. (in earlier terminology) is about an object. Everything whatsoever—whether it is possible or not, complete or not, paradoxical or not, thinkable or not—is an object. Most objects do not exist, in any way at all, or have any form of being (or other ontological status) at all. Nonexistent objects, nonentities, are constituted in one way or another, and have more or less determinate natures. An object, whether it exists or not, has those properties which characterise it, e.g. the object which fs does f, where f is a characterising property. But

existence, and many other properties (especially “higher-order” properties) are not characterising properties.(8)

Additional theses, presupposed in and of some importance for what follows are these: Universals are objects which do not exist (hence also they are something). Objects are not reducible to entities; for instance, nonexistent objects are not in some way constructs from what does exist, and discourse about nonentities is not translatable, without residue, into discourse about entities.(9) Running in tandem with this is a nonreductionist theme (with something of the ring of the later Wittgenstein): Nonentities are mostly perfectly in order as they are, without reduction. With intensionality as with nonexistence, noneism is committed to commonsense theses (again of a later Wittgenstein cast): Very many intensional statements are perfectly in order as they are, without reductive analysis, and are about the objects they appear to be about. For example, ‘Bacon looked for Atlantis’ is about Bacon and Atlantis. There is just one object sought, Atlantis; there is no need to try to resolve the statement into one concerning concepts, or complex set-theoretic constructs, or such like; whether or not Atlantis ever existed.

The foregoing themes lead naturally (once the semantical theory is introduced) to further theses,(10) theses that go to the heart of philosophy (as many have seen it), theses stating conditions on the truth and explanation of things in the world: the truth conditions for the factual world T, and also for its actual subworld *G*, involve nonentities, essentially. This thesis, that truth depends on nonexistence, derives in part from the earlier theme that there are irreducible truths about what does not exist. Further, the explanation of what exists, and so of the actual world G, involves essential appeal to what does not exist, to other worlds beyond *G*. It is themes like these that render noneism a transcendental position,(11) and align it with idealism.

Contrary to empiricism, then, we do need to go beyond the factual world and to consider possible and impossible worlds, and beyond entities of the factual world to consider a wide

range of other objects, including impossible and merely possible ones. In particular, according to noneism, we cannot adequately understand or explain the actual world, its entities and its phenomena, without going beyond to other worlds, without adverting, in essential ways, to the non-actual. *The actual is not sufficient*, on its own, *to account either for truth or for explanation*." (pp. 51-52)

(8) The emerging big theory, noneism, is a kind of amalgam of Meinong with the later Wittgenstein; so however strange the combination may seem, it can claim a good Austrian ancestry.

(9) While a semantical analysis of discourse about nonentities can be given, e.g. through a universal semantics (cf. Routley (1979), 1.24), in terms of what Platonists are pleased to call 'entities', the objects involved in the analysis do not exist.

(10) So far only nonepistemic themes have been assembled. For subsequent comparisons, especially with ways of knowing and interworld access of idealism, mysticism, primitivism, etc., it will however be important to introduce epistemic and limitative theses.

(11) In the standard sense of 'transcendental', of being other-worldly, necessary for (the explanation of) experience, and not reducible to it.

"Medieval logicians have a great deal to teach their modern descendants.(1)

They discussed issues that are of contemporary importance with an ingenuity and sophistication lost till this century. We will illustrate this by considering an argument produced by a medieval logician, fated to become known as 'Pseudo-Scotus'. It was rescued from oblivion by Bocheński in 1938 and has been commented on more recently, particularly by Benson Mates

and Stephen Read.(2) However, a good deal more can be learnt from Scotus' argument as we will show. Specifically we will formulate separate lessons in Sections 2, 4 and 6." (p. 189)

29. Routley, Richard, Routley, Val, Meyer, Robert K., and Martin, E.P. 1982. "On the Philosophical Bases of Relevant Logic Semantics." *Journal of Non-Classical Logic* no. 1:71-105.

"Criticisms of semantics for relevant logics, Commonly enough encountered in discussion, are beginning to appear in print. For example, such criticism has come from Scott who asserts,

without any supporting argument, that 'the recent semantical interpretations [of relevance logics) have as yet no adequate philosophical justification'· (74, p. 154). A rather similar criticism 'of model-theoretical interpretations of existing relevant logics' is implied by Hintikka (81, p. 80). Analogous criticisms are part of Lewis's recent attack on relevant and paraconsistent logics (in 82). But the bulkiest "case", which includes most of the criticisms commonly indicated, has been presented by Copeland:

And the Routley-Meyer semantics, it will be urged, fails to satisfy those requirements which distinguish an illuminating and philosophically significant semantics from a merely formal model theory (Copeland 400)

Although Copeland reiterates this now familiar claim, that the Routley Meyer semantics for relevant logic is a mere formal model theory as distinct from "a semantics" (see also pp. 406, 408, 412), like others he

omits to specify the requirements upon 'an illuminating and philosophically significant semantics': so urging does not give way to arguing in any rigorous way for the theme (thus too the promise of his short title 'When a semantics is not a semantics' is never fulfilled). Furthermore, the supporting considerations offered for the theme are based, like several of the incidental remarks concerning relevant logics, upon faulty but often unstated assumptions and mistaken data. Although the unfavourable conclusions are stated clearly enough, the structure of the argument by which they are reached is often decidedly unclear, and indeed the case relies upon obscurjty and lack of precision. Consequently meeting this often nebulous set of objections requires proceeding beyond what is directly stated to examination of what the case requires if the considerations actually presented are to show anything damaging against relevant semantics in the way declared." (p. 71)

32. Routley, Richard, and Meyer, Robert K. 1983. "Relevant Logics and their Semantics Remain Viable and Undamaged by Lewis's Equivocation Charge." *Topoi* no. 2:205-216.

    "Is relevant logic but a logic for equivocators? Such Lewis's provocatively entitled 'Logic for equivocators', directed against relevant logic, certainly seems to imply. But the ambiguity interpretation which he proposes he is unable to get to work for relevant logic, so he falls back on the first degree implication (fde) parts(4) of the irrelevant logics *LP* and *RM*: in these "we have two logics for ambiguous sentences

    - and lo, they are partly relevant" (p. 439). Not only is Lewis well off the relevant target(5) ; but the argument for the conclusion that relevant or cryptorelevant logics are logics of ambiguity, or, for equivocators, is a decidedly poor one. For what we are offered are three-valued interpretations of fde *LP* and *RM* through the values: true osd only, i.e. true on all its disambiguations; false osd only, i.e.

false on all its disambiguations; and both true osd and false osd, i.e. true on some disambiguations and false on others (pp. 438-9). The Lewis interpretation is evidently a simple variation on the truth-valued interpretation obtained by, in effect, omitting 'osd', an interpretation - the intended interpretation for *LP* and *RM3* -- which Lewis tries to rule out as "not making sense". (p. 206)

(4) There is a logical howler running systematically through Lewis's paper. He has 'first degree' where he should have 'fde', unless nonstandard names are adopted. But as 'first degree' is nowhere explained, it must be assumed to have its standard sense. It follows, e.g., from what Lewis asserts that the first degree part of E has a four-valued semantics (see p. 433). This is false.

Since everything in the discussion that follows is restricted to the first degree, talk of 'relevant logic' in the singular is (perfectly) in order.

(5) And Io, also, they axe substantially irrelevant. While RM has long been associated with the relevant enterprise, though not as an acceptable explication of the key notions under investigation, LP has not, and, at the time of design and development of *LP*, Priest explicitly disassociated himself from the relevant enterprise.

36. Routley, Richard. 1984. "The American Plan Completed: Alternative Classical-Style Semantics Without Stars, for Relevant and Paraconsistent Logics." *Studia Logica* no. 43:131-158.

    Abstract: "American-plan semantics with 4 values 1, 0, {1, 0} { }, interpretable as True, False, Both and Neither, are furnished for a range of logics, including relevant affixing systems. The evaluation rules for extensional connectives take a classical form: in particular, those for negation assume the form 1 ε *t* (~ *A*, *a*) iff 0 ε *t A*, *a*) and 0 ε *t* (~ *A*, *a*) ifI 1 ε *t* (*A*, *a*), so eliminating the star function *, on which much

    criticism of relevant logic semantics has focussed. The cost of these classical features is a further relation (or operation), required in evaluating falsity assignments of implication formulae.

    Two styles of 4 valued relational semantics are developed; firstly a semantics using notions of double truth and double validity for basic relevant system ***B*** and some extensions of it; and secondly, since the first semantics makes heavy weather of validating negation principles such as Contraposition, a reduced semantics using more complex implication M rules for relevant system ***C*** and various of its extensions.

    To deal satisfactorily with elite systems ***R***, ***E*** and ***T***, however, further complication is inevitable; and a relation of mateship (suggested by the Australian plan) is introduced to permit cross-over from 1 to 0 values and vice versa."

37. ———. 1984. "Relevantism, Material Detachment, and the Disjunctive Syllogism Argument." *Canadian Journal of Philosophy* no. 14:167-188.

"Relevantism, as a matter of definition, rejects classical logic as incorrect and adopts instead a relevant logic as encapsulating correct inference. It rejects classical logic on the grounds that the rule of Material Detachment, from A and not A or B to infer B, (that is, Disjunctive Syllogism considered as an inferential principle), sometimes leads from truth to falsity. Relevantism - although promoted by some relevant logicians (Routley and Routley), and an integral part of ultralogic (i.e. universal, all purpose, ultramodallogic; cf. [1], [8]) - has recently encountered heavy, but interesting, criticism from relevance logicians themselves (from Belnap, Dunn, and Meyer). Though the discussion that follows accordingly involves some reporting of internal wrangling among relevance logicians, it is feuding of major importance as regards the question of choice of logical theory. For, firstly, if relevantism is right, then orthodox choices of logic, such as classical or intuitionist choices, are wrong. Secondly, the issue is by no means as parochial as relevant logic, but concerns the matter of serious choice of paraconsistent logic as correct, and as working logic (on paraconsistent logics see Arruda [7]). For Material Detachment is inferentially equivalent in a relevant setting to the Duns Scotus principle (A, ~ A → B, from A and not A to infer B), the rejection of which separates paraconsistent logic from classical (and intuitionistic) logic. The wider issue generated is then: to what extent, and when, can a *paraconsistent theory correctly, or legitimately, make use of classical reasoning?*" (pp. 167-168)

    Introduction to a special number dedicated to the paraconsistent logics.

    "The papers in this volume are all on the subject of paraconsistency.

    This introduction locates the papers in their context and also provides a survey of the general area." (p. 3)

    (...)

    "The important fact about paraconsistent logics is that they provide the basis for inconsistent but non-trivial theories. In other words, there are sets of sentences closed under logical consequence which are inconsistent but non-trivial. This fact is sometimes taken as an alternative definition of 'paraconsistent' and, given that logical consequence is transitive, it is equivalent to our definition. For this reason we call inconsistent but non-trivial theories *paraconsistent* .

    The equivalence indicates one reason why paraconsistent logics are worthy of study. For there are important inconsistent theories which are non-trivial. Any analysis of their logical structure must therefore be done

using a paraconsistent logic. Clearly, to adopt an explosive logic such as Frege/Russell or intuitionist logic would trivialise them." (p. 3)

41. Sylvan, Richard. 1984. "How Science and Myth and Fiction Step Beyond the Actual and Sometimes Beyond the Possible." *Research Series in Unfashionable Philosophy* no. 1:1-33.

    Abstract: "Sistology, the general Investigation of all items, Is explained. It Is contrasted with its dwarf subtheory, ontology, which is restricted to existent objects. Sistology cannot be recovered from ontology. Sistology, unlike ontology, assigns nonexistent and Impossible objects standing. How this is accomplished logically is outlined; and resulting advantages for linguistics, language and literature are indicated. The theory is then applied to a comparison, in depth, of (failed) science with fiction.

Science and fiction are much more alike than generally supposed. Indeed they do not differ essentially In syntactical ways, and overlap significantly in content. (While they do differ more significantly on technological applications, that is frequently not to sciences credit.) To force what differences there are, a detailed characterisation of *science* is presented, which is then compared point by point with fiction. What emerges Is that science and fiction form merging families, with deductive closure and qualified confrontation with experience affording main separation features.

What remains of the gap between science and fiction Is bridged by myth, which often provides other cultures versions of science. Leading features of myth are explained and two styles of myth roughly delineated, anthropic myths and naturalistic myths. The latter merge with failed science.

The resemblances are exploited both In criticising fashionable accounts of scientific theories and scientific explanation, and in offering new accounts. A scientific theory is a story, which is closed, in particular under deduction, and which suffers qualified exposure to experience, that Is", which meets reality requirements. Scientific explanation also fits within the story setting, a covering story replacing the orthodox "covering law" model. The account accommodates what Is crucial in much explanation, explanation of what exists by way of what does not exist.

Science is Integrally Involved not merely with what does not exist, but also with what is impossible. The role of Inconsistent theories and other inconsistent objects is Indicated, and the emerging theory is applied to certain psychological puzzles concerning thinking the impossible."

This paper Is to appear In German, In an issue of *Zeitschrlft fur Semlotik* entitled *Zeichen und Fiktlon* . [Vol. 9, 1987, with the title: "Wissenschaft, Mythos, Fiktion: Sie alle überschreiten die Grenzen des Wirklichen und manchmal gar die des Möglichen".]

42. Routley, Richard, and Routley, Val. 1985. "Negation and Contradiction." *Revista Colombiana de Matematicas* :201-231.

Abstract: "The problems of the meaning and function of negation are disentangled from ontological issues with which they have been long entangled. The question of the function of negation is the crucial issue separating relevant and paraconsistent logics from classical theories. The function is illuminated by considering the inferential role of contradictions, contradiction being parasitic on negation.

Three basic modellings emerge: a cancellation model, which leads towards connexivism, an explosion model, appropriate to classical and intuitionistic theories, and a constraint model, which includes relevant theories. These three modellings have been seriously confused in the modern literature: untangling them helps motivate the main themes advanced concerning traditional negation and natural negation. Firstly, the dominant traditional view, except around scholastic times when the explosion view was in ascendency, has been the cancellation view, so that the mainstream negation of much of traditional logic is distinctively nonclassical. Secondly, the primary negation determinable of natural negation is relevant negation. In order to picture relevant negation the traditional idea of negation as otherthanness is progressively refined, to

nonexclusive restricted otherthanness. Several pictures result, a reversal picture, a debate model, a record cabinet (or files of the universe) model which help explain relevant negation. Two appendices are attached, one on negation in Hegel and the marxist tradition, the other on Wittgensein's treatment of negation and contradiction."

43. Sylvan, Richard. 1986. "Toward an Improved Cosmo-Logical Synthesis." *Grazer Philosophische Studien* no. 25/26:135-179.

    Originally published as "Towards a CosmoLogical Synthesis", *Research Series in Unfashionable Philosophy,* 2, 1985, 42 pages.

    "There is a persistent tradition implying simple and unassailable logical foundations - as yet undiscovered - for the whole of cosmology. The tradition, which peaked in modern rationalism, continues strong in contemporary cosmological speculation. Thus, for example, recent rationalistic theories of

the universe, ambitiously aimed at mathematico-logical expression and capture of nature." (p. 135)

(...)

"Logic reassumes its ancient role as the fundamental science; the Word expresses a logic recipe.

(...)

The synthesis outlined in what follows fits into this more modest setting. It is achieved by suitably relocating cosmology as a part of semantics (generously construed, for example, to admit contextual

elements)." (pp. 135-136)

(...)

"The underlying idea of the synthesis is simply this: a subspace of neutral worlds semantics is also a suitable framework for cosmology, for an interpretation of the logical theory of the universe as a whole." (p. 136)

(...)

"The setting in terms of objects which do not exist, other worlds especially, is essential. For one reason, the idea grew out of investigation (for UQ) of what is normally taken to be a philosophical question, indeed by some such as Heidegger as the fundamental question of metaphysics, namely 'Why does anything at all exist?'. Reset in world terms this becomes a question of the selection of a world such as that we find ourselves in which contains something existent (us among other existent things) as opposed to an alternative world, which contains nothing- a much more tractable question. But the recasting loses explanatory merit should all the worlds involved be taken to exist. For then the old objectionable circle is simply reentered, explaining existence in terms of more existents." (p. 137)

44. ———. 1987. "A Generous Jainist Interpretation of Core Relevant Logics." *Bulletin of the Section of Logic* no. 16:58-66.

Both of the 'principal philosophical theories' by which Jainism is commonly distinguished(2), relative pluralism (*anekantarada*) and qualified scepticism (*syavada*) involve 7-fold lists. In the first there is a categorization of 7 perspectives, while, under the second, more important here, 7 modes of predication are marked out. 'About a given object, we may assert [with respect to a given feature, or existentially] (1) "Maybe it is"; (2) "Maybe it is not"; (3) "Maybe it both is and is not"; (4) "Maybe it is inexpressible"; (5) "Maybe it both is and is inexpressible"; (6) "Maybe it is not and is inexpressible"; and (7) "Maybe it both is and is not, and is inexpressible".

The maybe's here are intended to show that dogmatic assertions are out of place ... (Smart, p. 160). Often the maybe's are omitted from lists of the modes of predication, and other variations are found e.g. 'inexpressible' is alternatively translated as 'indescribable', etc.

Thus, given Jainism apparently entailed a correspondence theory of truth (Smart p. 160), for every statement p – (inevitably) or subject predicate form – there are the following assignments of values, all of which may be attained: (1) true, i.e. t, where (maybe) it is; (2) false, i.e. f, where (maybe) it is not; (3) t and f; (4) inexpressible, i.e. i, where (maybe) it is inexpressible; etc." (p. 62)

(2) To be a little more precise than Smart, those are the main epistemological theories which distinguish Jainism. For Jainist bio-conativism, which anticipates Schweitzer and a reverence-for-life position in contemporary environmental philosophy, is certainly a philosophical theory, and apparently that for which Jains are best Known.

    Reply by Jonathan P. Seldin, "A Relevant Invalidity in Curry's Foundations: A Reply to Richard Sylvan", Bulletin of the Section of Logic, 16, 1987, pp. 68-70.

    "Curry claims that the positive paradox principle, ⊢ A ⊃ (B ⊃ A) (33) in his elementary statement presentation, ‘is valid in any normal interpretation’ ([1], p.173). By previous definition, 'an interpretation of a system

    S is a normal interpretation just when the proposition A is true when and only when ⊢ A' (p.172). But his argument to normal validity (and so truth) is interestingly, and relevantly, invalid." (p. 51)

    (...)

    "This may seem to make, obscurely at that, no more the familiar concession that the positive paradox (33) does not hold for logical (or strict) implication. But given Curry’s identification of ⊃ as the propositional analogue of a conditional, it says much more than that: it says, correctly, that the positive paradox principle does not hold for the conditional.

    Nor do matters end there. There are relevant consequences, to be looked at elsewhere, for illative combinatory logic and type-free λ-theory." (p. 53)

46. ———. 1987. "Establishing the Correspondence Theory of Truth and Rendering it Coherent." In *Stephan Körner - Philosophical Analysis and Reconstruction* , edited by Srzednicki, J. T. J., 75-83. Dordrecht: Martinus Nijhoff.

    "In his rewarding book, *Fundamental Questions of Philosophy* , Stephen Körner introduces the correspondence theory of truth as seemingly 'the most natural analysis of truth', explains what

the theory tries to do, and what it does not attempt, defends the theory against some standard objections, and advances difficulties for rival theories of truth (see p. 101ff.). What follows removes the limitations Körner claims to find on the correspondence theory; it also elaborates upon what Körner has explained, but at the same time makes one or two significant variations, as will appear." (p. 75)

(...)

"Certainly any idealist who finds classical logic the right medium in which to logically set his or her verificationist proclivities - as the logical positivists thought that this was the right medium for verification, with none of this new-fangled intuitionism - should not be displeased. As for us, well, we can have both correspondence and coherence along with Tarski-Bolzano theory duly generalised.(8) And no doubt other theories of truth can be worked into the synthesis too; but that's a task diverging from KBrner and for another day." (p. 80)

(8) Tarski not only saw the semantic theory as complementing a correspondence theory but also was one of the first to explicate maximal consistent sets; he, if anyone, is behind this whole conspiracy.

48. Sylvan, Richard. 1988. "Intuitionistic Logic - Subsystem of, Extension of, or Rival to, Classical Logic?" *Philosophical Studies* no. 53:147-151.

"The short well-known answer to the title question is, yes, all of those. It depends, in large measure, on how we formulate the systems, compare them, and apply them. Formulated as a system in connectives {→, V,

&, ~}, Lewis modal system S3 is a subsystem of classical logic S, similarly formulated, which results (for instance) by adjoining Peirce's implausible law. But with S recast as a system in connectives {&, ~} (or

{V, &, ~), S3 reappears as extension of S, got by adding a modal connective →, (interdefinable with □) and appropriate postulates.

With relevance logics, such as *R* and *E,* which are in many respects like modal logics (S3 is tantamount to *E* + Antilogism), it is similar: these logics are both subsystems of S and extensions of it. But there is a

most significant difference from the modal situation, which concerns applications. The difference, important for applications to inconsistent and also incomplete theories, turns primarily on the scope of the rule of

Material Detachment MD. A, ~(A & ~B) / B." (p. 147)

(...)

"It is of passing interest, then, that intuitionist logics and some of their neighbours can be construed as maintaining classical, truth-functional, behaviour for connectives 'and' and 'not' (or, to start with, absurdity),

while diverging as regards behaviour of 'or' and 'only if'. From this perspective of course, intuitionism and minimalism become, like modal logics, extensions of classical logic, adding to it intensional connectives

of disjunction and implication -- not rivals to it, though not rulepreserving extensions. Thus are many claims in the

standard literature upset, not only those of Fitting, but, for instance, scene-setting assumptions

of Haack concerning intuitionisfic deviance." (p. 150)

50. ———. 1988. "Radical Pluralism - an Alternative to Realism, Anti-Realism and Relativism." In *Relativism and Realism in Science* , edited by Nola, Robert, 253-291. Dordrecht: Kluwer.

"Realism, the dominant 20th century position in Anglo-American thought, is, in the relevant sense, a one world position. There exists a unique actual world, or reality, external to "us", which not only determines

how things are locally and globally, but determines as well truth, and thus also uniquely fixes correctness in science, the correct theory being that which corresponds to reality. Anti-realisms such as idealism

and phenomenalism reject, in one way or another, the tricky externality requirement. Relativism and pluralism, by contrast, reject one of the uniqueness requirements, but in significantly different ways. Relativism

resists, in one fashion or another, the imposition of any ranking better than "equally good" and of any rankings warranting differential choice, on the multiple interpretations or, very differently, multiple realities or

worlds disclosed. Pluralism, however, to set down at once the crucial contrast, permits and typically makes rankings, which enable choice (including realist and idealist and theist choices, among many others).

Pluralism thus comes in two distinct forms: theory or meta-pluralism, according to which there are many correct theories (especially larger philosophical positions) but at most one actual world; and radical or

deep pluralism which goes to the root of these differences in correctness, to be found in things, and discerns a plurality of actual worlds as well as of theories." (p. 253)

(...)

"Why select sistological pluralism, that is, a pluralism based upon object-theory? A first reason is that some selection is practically inevitable.

(...)

Partly to reduce complexity, then, but also partly because of severe limitations of space and energy, only one main form of pluralism has been outlined, sistological pluralism. It is but one style of pluralism, an apparently novel, radical form. It does not, like wishy-washy orientational or entrepreneurial pluralism operate only at the theory level (or meta-level), somehow abandoning the hard-to-separate world level (or object-level) level to realism and its more puritan rivals. There is excellent reason not to do so. For one, sistological pluralism does not need to rely on an implausible sharp cut-off between levels. For another, it does not simply give a pluralistic veneer to orthodoxy and dogma, such as accompanying object-level "realism" may underwrite." (p. 278)

(...)

"Justification for looking at, studying, presenting or showing off a pretty logic, or an unusual radical theory, does not have to be of pragmatic cast, that it does something, succeeds somewhere, works well. It may just be a fine enough thing in its own right - somewhat as a tract of rainforest may be valuable in itself, and, though rather rich and complex, not particularly well-organised, or useful for humans, or good for this or that, or unique. Sistological pluralism is a fine and rich theory, fun to work and play with, and to contemplate, irrespective of whether

it is good for much - which, as it fortunately happens, it is. (p. 285)

51. ———. 1988. "Relevant Containment Logics and Certain Frame Problems of AI." *Logique et Analyse* no. 121-122:11-25.

    Abstract: "Relevant containment logics, which combine relevant logics with content containment requirements, are motivated and explained. Semantics for some of these logics are introduced and shown to be adequate. In the light of the semantics the logical theory is improved, and other directions for elaboration are indicated. Finally, the logics are applied to one significant part of the vexatious frame problems of AI , and a route to implementation is suggested."

53. Sylvan, Richard, da Costa, Newton, and Carneiro, Alfonso. 1988. "Cause as an Implication." *Studia Logica* no. 47:413-427.

    Abstract: "An appropriately unprejudiced logical investigation of causation as a type of implication relation is undertaken. The implication delineated is bounded syntactically. The developing argument then leads to a very natural process analysis, which demonstrably captures the established syntactical features. Next relevantly-based semantics for the resulting logical theory are adduced, and requisite adequacy results delivered. At the end of the tour, further improvements are pointed out, and the attractive terrain beyond present developments is glimpsed."

    "The notion of cause, having fallen from favour in the heydays of logical positivism, has enjoyed a contemporary resurgence. But despite its fashionability now, especially as a major foundational element in epistemology, the logical and structural properties of causation remain quite insufficiently examined. In this situation, who knows whether the foundations will carry the philosophical castles being built (they are never complete, and invariably ramshackle)? Our preliminary investigation of causal implication suggests they

will not; like structurally and materially short-supplied high-rise buildings, they will come tumbling down." (p. 413)

    Reprinted in: *Artificial Intelligence in Australia* , 1988, p. 37.

55. Sylvan, Richard, and Priest, Graham. 1988. "Answering Another Alleged Dilemma Destroying Dialetheism." *Bulletin of the Section of Logic* no. 17:42-52.

    "To leave matters in no doubt, we obligingly assert that the Russell class R , i.e. $\{x : x \notin x\}$, both belongs to itself and also does not belong to itself; in short, we assert $R \in R \,\&\, \sim (R \in R)$. To be quite explicit, we assert the contradiction $r \,\&\, \sim r$, where r abbreviates $R \in R$. Thus, in convenient symbols, $\vdash_{\delta} r \,\&\, \sim r$ where δ is the group of dialethicians comprising (at least) Priest and Routley. Now Goldstein asserts not, or not just, that we should not do what we have naughtily done, but that we cannot; it “is not that people should not assert contradictions, but that they cannot, even though they may purport to do so” ([1], p. 11).

    Goldstein offers a neat, but nontheless fallacious, argument to support his assertion that we, along with distinguished dead dialetheicians (Fichte, Hegel and Peirce are cited), cannot do what we purport to have done, asserted a contradiction." (p. 42)

    (...)

    "The problem with contradictions, on mainstream perceptions, is not that they cannot be asserted, but that they lead, not nowhere, but everywhere.

    But no one with a modicum of logical sophistication, not just dialetheicians, would accept this idea, would grant ex falso quodlibet and its scruffy mates." (p. 47)

Annotated bibliography of the logical works of Richard Sylvan [*né* Routley] (1989-2020)

Bibliography

1. Routley, Richard, and Brady, Ross. 1989. "The Non-Triviality of Extensional Dialectical Set Theory." In *Paraconsistent Logic: Essays on the Inconsistent*, edited by Routley, Richard, Priest, Graham and Norman, Jean, 415-436. München: Philosophia Verlag.

   "A uniform dialectical resolution of both the logical and the semantical paradoxes was argued for in earlier work (notably in [9]). But the adequacy of that resolution was by no means established. This paper, which shows the non-triviality of extensional dialectical set theory with a general comprehension axiom, represents a further step in the direction of proving the adequacy of the resolution. The methods of proof used - at the core persistence arguments - extend the methods of [2] and [3]. As pointed out in [5], these methods apply equally in the case of the semantic paradoxes.

   It should also be noted that these systemic methods almost exactly resemble the meta-linguistic strategies more recently investigated by Kripke in [6]." (p. 415)

"1. The paradoxes of deontic logic and the consistency and modal requirements

Especially since mid-century many systems of deontic logic have been advanced, which attempt to explore the logic of such deontic notions as obligation, permission and prohibition, right and wrong. Almost all these systems have been modal systems, which treat deontic notions as modal, i.e. as if strict or provable equivalents are intersubstitutable within them preserving truth(2). All such systems are mistaken in a quite fundamental way. For deontic functors such as obligation and prohibition are not modal functors, but are more highly intensional than modal functors, and so demand a greater degree of propositional discrimination than modal logics can provide.

The damage caused by the mistaken treatment of deontic notions as modal shows up in various ways, but we shall be primarily concerned with only one of these, the consistency requirements and the exclusion thereby of moral dilemmas. Another way in which the modal damage appears is through a series of related paradoxes, such as, directly, the paradoxes of derived obligation, and, less directly, the paradoxes of the Robber and the Good Samaritan.(3)" (p. 653)

(2) This was true even of Mally's pioneering system of 1926 which permitted replacement of logical equivalents within the scope of obligation function a (see F & H, p. 3). Von Wright's seminal work (in 1951), which set the pattern for mainstream deontic logic, was explicitly based on the modal comparison of deontic functors with modal functors, and built modal assumptions in at the bottom of the theory.

The exceptional systems, that break the modal connection, are deontic systems based on relevant logics; on such systems see RLR, chapter 8. (3) These paradoxes are explained, and their modal bases exposed, in 5. On the paradoxes of derived obligation, see further Prior 62, p. 224; and for some of the considerable literature on paradoxes like those of the Robber and Good Samaritan, see the Hilpinen anthologies and especially Vermazen. A detailed uniform treatment of all these and other deontic paradoxes in the framework of relevant logic is given in RLR II.

3. Routley, Richard, and Priest, Graham. 1989. "Contradiction, Assertion and 'Frege's Point'." *Analysis* no. 49:23-26.

   "The liar sentence ('This sentence is not true') is both true and not true. The Russell set ({x: x ∉ x}) is both a member of itself and not a member of itself. These and many other contradictions we, the authors, are prepared to assert. Most people would disagree with us - and disagree fairly violently. But there is a minority of people who would refrain from disagreeing on the ground that we have said nothing to disagree with. Though we may have uttered words, no statement is made by them. Explicit contradictions cannot be used to make a statement. This line, though hardly orthodox, has, of course, a distinguished pedigree. It was argued by Aristotle in Metaphysics Γ 3,' and since then has resurfaced from time to time in the cancellation view of negation. (See Routley and Routley [5].) Most recently, it has been advocated by Laurence Goldstein [2], who has produced a novel argument for it. The purpose of this note is to refute the argument. As we shall see, this is not difficult; the dis- cussion, however, raises some points of independent interest." (p. 23)

   (...)

   "In general, and normally, to assert a conditional is not to assert its consequent; in particular cases, however, it may be. (6) This is, we think, a main lesson of Goldstein's argument." (p. 26)

   (6) Similarly for disjunctions. Normally, to assert $\alpha \ V \beta$ is not to assert α or β. But for certain instances of $\alpha \ V \beta$ (e.g. $\alpha \ V \alpha$) it may be.

Paraconsistent Logic: Essays on the Inconsistent, edited by Routley, Richard, Priest, Graham and Norman, Jean, 3-75. München: Philosophia Verlag.

"Although the notion of system was brought into prominence by Leibniz,(1) it is only in contemporary times that a clear conception of a formal or semantical system has developed. Thus recent definitions of paraconsistency(2) through such systems-in terms of systems which can tolerate some inconsistency without trivializing-are not strictly or directly applicable in a historical quest. Evidence of paraconsistent approaches in earlier times has accordingly to be more circumstantial.

There are however several good indicators of paraconsistent approaches of one sort or another which can be reliably used. For example, admission, or insistence, that some statement is both true and false, in a context where not everything is accepted or some things are rejected, is a sure sign of a paraconsistent approach-in fact of a dialethic approach. It involves not merely recognition of a non-trivial inconsistent theory, as with a (weaker) paraconsistent position, but the assumption that that is how things are, that, in effect, the world is inconsistent. A concession that both a statement, A say, and its negation, ~A, hold, works in a similar way, clearly revealing a strong paraconsistent approach. So does the concession that some statements A and ~A hold in a nontrivial theory or position, thereby revealing a weaker paraconsistent approach.

But often evidence is less direct. For instance, an author may not explicitly say that both A and ~A hold, or hold in a given theory, but what is said obviously implies that they do, and the author can be assumed to be aware that they do, or a case can be made that the author is aware of this. In such cases the approach is still explicitly paraconsistent. But an author may not be (clearly) apprised of what his or her position (obviously) implies, in which event the position will be either implicitly paraconsistent or else trivial, depending on the underlying logic adopted." (p. 3)

5. ———. 1989. "An Outline of the History of (Logical) Dialectic." In *Paraconsistent Logic: Essays on the Inconsistent*, edited by Routley, Richard, Priest, Graham and Norman, Jean, 76-98. München: Philosophia Verlag.

"7. Summary and prospects

It will be clear that dialectic, as befits a theory of development, has developed markedly over two and a half thousand years of philosophy. We have isolated two major phases: Classical Greek philosophy and Modem German philosophy. Although they are very different, one is the development of the other, and there is an important parallel between the phases. Both started off concentrating precisely on contradiction within the setting of (perplexing) arguments. Both then developed into a theory of development in which contradiction plays the central role. Finally, both went into a period of decline when the specific essence of dialectic, literal contradiction, was forgotten, and consequently dialectic became a subject of high generality but little content. All this we have documented.

Of course the evolution of dialectic will continue and we think that we are at the start of a new phase of growth, during which symbolic logic will play a fundamental role. It will again start with a concentration on contradiction itself within the framework of argument procedures, especially convincing arguments which lead to contradiction. To an extent this has already happened with the matter of logical paradoxes and of paraconsistent logic.

However it is also evident that a correct understanding of the history of dialectic is essential for further progress. To this end an analysis of the history of dialectic, and particularly Hegel's dialectic, using the techniques of modem logic is essential. From what has been said it is obvious that such an analysis will have to accommodate the notion of a true contradiction.

Thus paraconsistent logic will be essential here too.(94) This analysis has already started, but remains in its earliest stages. (95) Where the whole modem study will take us, we can only speculate." (p. 92)

(94) It follows that the few attempted formalizations that have appeared which use classical logic are doomed to failure. Some of these can be found in Marconi, 1977.

(95) See, for example, Routley and Meyer, 1976; da Costa and Wolf, 1980; Priest, 1982; and Pena, 1980.

6. ———. 1989. "Systems of Paraconsistent Logic." In *Paraconsistent Logic: Essays on the Inconsistent*, edited by Routley, Richard, Priest, Graham and Norman, Jean, 151-186. München: Philosophia Verlag.

   "Let ⊨ be a relation of logical consequence. ⊨ may be defined either semantically (Σ ⊨ A holds iff for some specified set of valuations, whenever all the formulas in Σ are true under an evaluation, so is A) or proof

   theoretically (Σ ⊨ A holds iff for some specified set of rules, there is a derivation of A, all of whose (undischarged) premisses are in Σ), or in some other way. ⊨ is explosive iff for

all A and B, {A, ~A}⊨ B. It is *paraconsistent* iff it is not explosive. A logic is *paraconsistent* iff its logical consequence relation is. If a logic is defined in terms of a set of theses it may have more than one associated consequence relation. For example, $\{A_1 \ldots A_n\} \vDash B$ iff $\vdash A_j \ldots \wedge A_n) \rightarrow B$ or $\vdash A_j \rightarrow (\ldots \rightarrow (A_n \rightarrow B) \ldots)$ or $A_1 \ldots A_n \vDash B$ (the last representing the theorem-preserving or weak inferential connection). In this case all its associated consequence relations should be paraconsistent.

Let Σ be a set of statements. Σ is *inconsistent* iff, for some A, {A, ~A} ⊆ Σ.

Σ is *trivial* iff for all **B**, B ε Σ. The important fact about paraconsistent logics is that they provide the basis for inconsistent but non-trivial theories. In other words, there are sets of statements closed under logical consequence which are inconsistent but non-trivial. This fact is sometimes taken as an alternative definition of 'paraconsistent' and, given that logical consequence is transitive, it is equivalent to the original definition. The proof is this: If Σ is an inconsistent but non-trivial theory then obviously the consequence relation is paraconsistent. Conversely, suppose that {A, ~A}≠ B. Let Σ be the transitive closure of {A, ~A} under logical consequence. Then Σ is inconsistent but B ∉ Σ. Because of the equivalence we also call any inconsistent but non-trivial theory *paraconsistent*, and derivatively, any position whose deductive closure provides a paraconsistent theory.

Why should one be interested in paraconsistent logics? Among the many reasons are proof theoretic and semantic ones." (p. 151)

7. ———. 1989. "Applications of Paraconsistent Logic." In *Paraconsistent Logic: Essays on the Inconsistent*, edited by Routley, Richard, Priest, Graham and Norman, Jean, 367-393. München: Philosophia Verlag.

"1. Introduction: the variety and types of applications

The most important application of paraconsistent logics is their application to possibly inconsistent theories. However one

needs to interpret "theories" here fairly liberally, as any body of doctrine, statements, axioms etc. which can be thought of as inferentially closed. The theories can be historical, current, embryonic or merely entertained. Of course the formalization of such theories often requires much wider logical apparatus than the mere first order deductive logic discussed in the introduction to Part Two of the book. This may include probability, inductive logic, the logic of various modalities and other intentional notions such as belief, and so on. Such things, or at least some of them, have been considered by logicians. But, by and large, the logical theories produced have been tuned to classical or at least intuitionist logic. This is singularly inappropriate since as often as not, the material to which the logical apparatus is applied is inconsistent, as we shall see. Accordingly the ideas of paraconsistency need to be applied to the logical theories of modality, probability, etc. themselves to produce adequate logical machinery. In this essay we will consider first some interesting inconsistent theories, some of them in some detail, and then move on

to consider the remodelling of various logical theories. It should be stressed that the studies of many applications mentioned are in their infancy, and we can often do no more than make suggestions for the directions of future research." (p. 367)

8. ———. 1989. "The Philosophical Significance and Inevitability of Paraconsistency." In *Paraconsistent Logic: Essays on the Inconsistent*, edited by Routley, Richard, Priest, Graham and Norman, Jean, 483-539. München: Philosophia Verlag.

   "Paraconsistency strikes at the root of principles which are fundamental to, and entrenched in, much philosophy. It is therefore bound to be philosophically problematic and to have important philosophical ramifications. In this introduction we will try to chart and analyse some of these issues. By its nature, this will require us to deal with a number of separate and not otherwise connected issues. However, we will start by looking at some important points raised by the arguments for paraconsistency in chapter V [*], section 1 above.

We will then go on to investigate some of the philosophical consequences of paraconsistency." (p. 483)

Contents: Essays by Richard Routley: I. First Historical Introduction: A Preliminary History of Paraconsistent and Dialethic Approaches (with Graham Priest) 3-75; II. An Outline of the History of (Logical) Dialectic (with Graham Priest) 76-98; V. Systems of Paraconsistent Logic (with Graham Priest) 151-186; XIII. Applications of Paraconsistent Logic (with Graham Priest) 367-393; XV. The Non Triviality of Extensional Dialectical Set of Paraconsistency Theory (with Ross T. Brady) 415-436); XVIII. The Philosophical Significance and Inevitability of Paraconsistency (with Graham Priest) 483-539; XXIII. Moral Dilemmas and the Logic of Deontic Notions (with V. Plumwood) 653-690.

"This book had its conception in a bar in about 1978, though the exact date escapes our collective memory. We had both been working in the field of paraconsistent logic for some years and were aware the subject was gradually gaining momentum. Yet the movement was still a diffuse one. This was, and still is, for two reasons. First, though many people were involved, they were spread fairly thinly over the globe, and communication was not particularly good. Secondly, the major papers that had been published on the subject were published in a variety of journals, some of them fairly inaccessible. It seemed to us that a focal point for work in paraconsistency was necessary, and would be provided by a suitable book.

We could have published a collection of already published essays but decided against it. Instead we wrote to those whom we knew to be working in the area who in turn informed those whom they knew: the book comprises papers that were sent to us in response. (We obtained however more papers than we could use: a number of the others have been published in an

issue of *Studia Logica* devoted to paraconsistency and edited by us. (1)

All the papers in this collection are published here for the first time and some of them are undoubtedly of the first importance for the future of the subject.

Researchers should also find the bibliography of paraconsistency helpful.

Paraconsistency will still be an unfamiliar and fairly esoteric topic to most people. We therefore decided to write a number of introductory essays on various aspects of paraconsistency, and these can be found at the beginning of each section of the book. (2)" (p. XIX)

(...)

"The word "paraconsistent" (meaning "beyond the consistent") was coined by Mira Quesada [*] to apply to the study of theories that are inconsistent but not trivial. In working on this book, however, we found that another piece of terminology was desirable. This was to express the idea that some paraconsistent theories are true. After exhausting all the dictionaries at our disposal (including Greek, Russian and Gaelic), we decided that no extant word would express this idea. So we were forced to coin one. A true contradiction is a Janus-faced creature which faces both truth and falsity.

The word 'dialetheia' ("two-way truth") seemed a fairly appropriate way of expressing this idea. Correspondingly dialethism is the view that there are dialetheias, true contradictions. We use these terms (with a little embarrassment) throughout our essays.

As with the variant spelling of "dialeth(e)ic" and its cognates, so even more with variant notation and referencing, and more still with the spread of heterodox ideas, there is in this book no stifling uniformity." (p. XX)

10. Sylvan, Richard. 1989. "Relational semantics for all Lewis, Lemmon and Feys' modal logics, most notably for systems between S0.3° and S1." *Journal of Non-Classical Logic*:19-40.

    A main object of the present exercise is to provide relational semantics for weak strict modal logics strictly between S0.5 and S2, relational semantics for other systems of the great system pioneers being textbook stuff. A relational semantics evaluates modal functors in terms of a (two-place) relation between situations or worlds: not, as in the much less revealing "neighbourhood" semantics, in terms of a relations between worlds and sets of worlds (thus relational semantics are in a sense "first order", by contrast with such neighbourhood semantics). The relational semantics for S1 and S1", in particular, are markedly superior to earlier neighbourhood semantics; they fit the systems better, and are more informative and they directly supply interpretable matrices for the logics and attractive algebraic analyses. With the provision of these semantics, furthermore, the supplying of such relational semantics for all the modal sentential logics presented and studied by the great pioneers, Lewis, Lemmon and Feys, is completed(2).

    (2) Of course Lewis, Feys and Lemmon were by no means the only important pioneers of modal systems - von Wright and Prior were among others - or always the earliest. Leibniz is now said, in Germany, to have outlined system S2, and MacColl, whose modal systematisation remains neglected, delineated a

system in the vicinity of S2. But the cited pioneers did much systematisation and taxonomy of systems; to them primarily we owe present main galaxy of modal systems.

11. ———. 1989. "Philosophical and Linguistic Inroads: Multiply Intensional Relevant Logics." In *Directions in Relevant Logic*, edited by Sylvan, Richard and Norman, Jean, 269-304. Dordrecht: Kluwer.

    "Many English sentences contain not just one intensional connective but several.

    Philosophical discourse and argument contain a particularly high concentration of intensional connectives, indeed of ultramodal connectives, those beyond the reach of modal logics. For it is not just that the fundamental argument relations of deducibility, implication and conditionality are intensional, indeed themselves ultramodal. So furthermore are central topics of philosophical investigation, such as: knowledge and belief; evidence, confirmation, and explanation; pastness and futurity, and the notions of tense, change and action; value, right and obligation; to begin with a listing. They are one and all intensional, and generally more highly intensional than the modal notions of possibility, necessity and contingency, or of provability and classical probability. The upshot is that any logical theory fit to pass initial adequacy conditions for the formalisation of associated discourse - and especially of philosophical arguments - will have to consider intensional connectives, indeed highly intensional connectives, and not just one at a time, but multiply. But virtually all previous theories fail to accommodate ultramodal notions. This is enough to motivate the present enterprise, that of adding many further, appropriately controlled, connectives to the

    implicational systems so far studied in relevant logic investigations (e.g. in the studies surveyed in RLR). Not too surprisingly, however, the further connectives singled out for special study are those that have attracted much philosophical discussion and have, for the most part, already been investigated, much less than satisfactorily, in applications of modal logic." (p. 269)

    "The thesis that philosophy is the logical syntax and semantics of language, that, more comprehensively, the task of philosophy is semiotical analysis, though sponsored especially by Carnap, was adopted by Russell before him and Montague and many others after him. The thesis foundered, so it came to be thought, like "Montague semantics" and "illocutionary logic" after it, on various immovable rocks, a major one being the inadequacy of the semantical framework in terms of which the thesis was to be made good, an inadequacy which left it unable to accommodate and account for much intensional discourse. A chief deficiency

    of the framework was, in fact, the restriction to the possible - to possible worlds and possible individuals, in short to possible items, worlds being a sort of item. An important by-product of general semantics for relevant logics is that they have shown how to remove, in a nontrivial way, the restriction to possible worlds (and thereby too that the restriction to possible individuals can be lifted and with it associated restrictions militating against incomplete, vague, and other supposedly recalcitrant items: see JB p.348ff.). We can move out of the modal dark ages." (p. 328)

13. ———. 1989. "Conclusion: Further Directions in Relevant Logics." In *Directions in Relevant Logic*, edited by Sylvan,

Richard and Norman, Jean, 399-437. Dordrecht: Kluwer.

"There is a great deal to be done, as always. For one thing, research papers commonly open at least as many questions as they resolve. Moreover, as has always been the way with minority research interests, there are few doing the work, especially compared with the numbers defending or propagating dominant "classical" logic and its complex epicycling.

Early in its rise to ascendency classical theory encountered a heavy variety of paradoxes and anomalies quite sufficient to have grounded it, had workable alternatives been available.

There were none with comparable scope. Alternatives have been slow to emerge, dominant positions blinkering discernment of rivals; these alternatives are still few, and none yet has wide appeal. Meanwhile classical theory has been able to fortify its position, to assemble a ring of defences, to pretend, for example, that the paradoxes and anomalies that come with it are inevitable or facts of life. Now with the advent of the two-valued Boolean computer age, it appears that limited skirmishes have been decisively won for the time being by the classical hordes, with the fair and the true roundly defeated by the tough and the crude. All of which is bad news for all subjects, like philosophy, involving reasoning, where two-valued classical logic has done much more harm than good.(1)" (p. 399)

(1) The points are documented in several places; see especially UU, or JB p. 898 ff.; also RLR.

From this angle, the various schools who have refused the enticements of classical logic and tried to persist with an expanded traditional logic (e.g. J. Anderson and the Sydney school) were not entirely wrong. But in avoiding propositional logic, for example, except as distorted through dubious reductions, they gave themselves a severe handicap.

14. ———. 1989. *Bystander's Guide to Sociative Logics: A short interim edition*. Canberra: Department of Philosophy. Research School of Social Sciences. Australian National University.

"In a *sociative* logic, premisses and conclusion of an argument, or correspondingly antecedents and consequent of a valid implication, are associated; they characteristically have enough to do with one another. To that extent any such logic is broadly relevant. But what have become known as relevant logics, the best known of which are the relevance logics largely forged in dirty Pittsburgh, comprise only a quite proper subclass of the broader class of sociative logics, many kinds of which have a much longer and more substantial history than relevant logics. If the story elaborated in this guide is correct early sociative logics did not arise in reaction to noxious irrelevant products; these logics were the original logics. The oversimplification and excessive power of irrelevant systematisation only came later; and then especially in the later middle ages and contemporary times when such systematisation came to dominate, there was a due, though substantially ineffectual, reaction against it.

What the later sociative logics that developed in reaction have in common is primarily the aim to avoid the most obvious paradoxes of dominant logical theorising. The plurality of logical theories and sketches that now make up sociative logics share little else however. There is no common commitment, for instance, to supply an account of entailment, or a theory of relevance, or a technical story of the use of premisses in argument, though there are bound to be commitments to some more central logical enterprises or other, such as elaboration of

a theory of argument or inference, an account of reasoning, explication of conditionals, and so on.

What these different commitments were and are, and ought to be, will begin to unfold as the story proceeds." (Preface, p. II)

Chapter by Richard Sylvan: Preface (with Jean Norman) VII-VIII; Introduction: Routes in Relevant Logic 1-21; Chapter 19: Philosophical and Linguistic Inroads: Multiply Intensional Relevant Logics 269-304: Chapter 22: Semantics Unlimited I: A Relevant Synthcsis of Implication with Higher Intensionality 327-376; Chapter 24: Conclusion: Further Directions in Relevant Logics 399-437.

"Relevance logics came of age with the one and only International Conference on relevant logics in 1974.

(..)

We thought that the collection of essays was still (even after more than six years in the publishing trade limbo) well worth publishing, that the subject would remain undeservedly esoteric in North America while work on it could not find publishers (it is not so esoteric in academic circles in Continental Europe, Latin America and the Antipodes) and, quite important, that we could get the collection published, and furthermore, by resorting to local means, published comparatively cheaply. It is indeed no ordinary collection. It contains work by pioneers of the main types of broadly relevant systems, and by several of the most

innovative non-classical logicians of the present flourishing logical period.

We have slowly re-edited and reorganised the collection and made it camera-ready.

While we have retained all the completed essays from the Conference sent to us with the exception of essays that have, in the interval, been published elsewhere, we have not limited ourselves to these essays but have, so far as space permitted, invited newer essays. As well we have included overviews, which provide introductions to current directions of research on broadly relevant logics and to many general problems in the area." (Preface, P. VII)

21. Sylvan, Richard. 1990. "On Making a Coherence Theory of Truth True." *Philosophica (Belgium)*:77-105.

    "In the last half century the coherence theory of truth has largely fallen into disuse and disrepute. While there is now some flirting with coherence approaches, as each approved version of the majority position, the correspondence theory, duly founders, and holism gains in fashionability, still coherence has but few committed friends. Granted, it has had friends of a sort: most notably Rescher, who has made significant contributions, on which others may profitably build. But Rescher, while advocating what he calls a 'coherence theory' has twisted the theory into what it is not, a modified "self-evidence" theory, and has also warped it into a methodological pragmatism that would have made straight old-timers like Bradley and Blanshard blanch. As well the major virtues of the theory - if only it could be got to work, which unfortunately it can't - have been appreciated by isolated explorers of the wide truth terrain, such as Blackburn (see esp. his pp. 237-8). The present exercise supplies one way of enabling the theory to work, without undue warping. That way does not pretend to be an authentic historical way, only an historically controlled and informed way. For the primary purpose here is not historical explication; it lies rather in the development of

    coherence theory *beyond* its previous and varied historical settings, to render it somewhat more adequate and more coherent, and to begin to display some of its further virtues." (p. 77, notes omitted)

    Abstract: "Da Costa's *C* systems are surveyed and motivated, and significant failings of the systems are indicated. Variations are then made on these systems in an attempt to surmount their defects and limitations. The main system to emerge from this effort, system *CCω*), is investigated in some detail, and "dual-intuitionistic" semantical analyses are developed for it and surrounding systems. These semantics are then adapted for the original *C* systems, first in a rather unilluminating relational fashion, subsequently in a more illuminating way through the introduction of impossible situations where and and or change roles. Finally other attempts to break out of impasses for the original and expanded *C* systems, by going inside them, are looked at, and further research directions suggested."

25. Sylvan, Richard. 1991. "Existence II: Existence and Nonexistence." In *Handbook of Metaphysics and Ontology*, edited by Burkhardt, Hans and Smith, Barry, 261-263. Munich: Philosophia Verlag.

    "While the topic of existence ought to be a central concern of philosophy, the fundamental notion of ontology, the notion in fact remains remarkably underinvestigated because of certain ancient prejudices, such as referential assumptions embedded deep in mainstream philosophy. Most important among these is the ontological assumption, according to which whatever is a (logical) subject, whatever is genuinely talked about, exists.

(The assumption appears in various different guises, e.g. as narrowed to what is truly talked about, and also in derived forms, e.g. as restricted to quantifiable talk, a form sloganized as ‘to exist is to admit of construal as a value of a bound variable’ and the like.) Accordingly, then, discourse that is apparently about what does not exist must be reduced, in one way or another, to proper (logical) form, namely that conforming to the above assumption.

The mainstream result is a grand (but misguided) reduction programme for many types of problematic language, especially that about fictions, i.e. fictional items generally, and that about universals, abstractions, and theoretical items. The so-called ‘riddle of existence’ (or ‘Plato’s beard’) derives from the same assumption. The puzzle is: how is it possible to make true statements, such as ‘Pegasus does not exist', about the nonexistent, since the statement yields both that the subject (Pegasus in the example) exists, by the assumption, and that it does not, because that statement is true? The received resolution involves both an analysis, or removal of ‘Pegasus’ from the class of genuine names and logical subjects, and circumscription of the ‘predicate’ ‘exists’ (and of course its associated negation) under the dogma that existence is not a predicate.

Under the alternative object-theory approach, still a minor philosophical stream but one systematizing much traditional philosophical and everyday practice, all this analytic and reductive activity is avoided. For example, ‘Pegasus does not exist’ is admitted to be what it appears to be, a grammatically satisfactory subject-predicate statement, without existential commitment; it is a statement about (or signifying) a non-existent object, Pegasus, and ascribing to it the property of non-existence. So existence, too, is a predicate, indeed a rather distinguished one, of which it would be reasonable to expect some suitable philosophical characterization. Neither it nor non-existence is especially puzzling, or beyond characterization and therefore discussion; nor is it without criteria because it is not a feature of everything nor is it distributed everywhere.

(...)

The assumption-undermining object-theory alternative does not carry any commitment to traditional doctrines concerning essence, long entangled (in priority and other disputes) with questions of existence. For characterization is a wider, less loaded notion than essence. Characterizations may be fuzzy, not tied to necessary and sufficient conditions but to looser specifications; they themselves are further non-existent items. Nor do they 'precede' existence, though elements of them are needed in order to ascertain whether something exists or not.

(...)

Although defining existence is a controversial affair, the notion is not entirely uncontrolled; there are fairly uncontroversial) bounds. It is generally taken that such material things as sticks and stones, which can hurt, do exist, but that mere names, as distinct from sounds and marks on surfaces, do not; nor do impossible objects or the characters of pure fiction or imagination or speculation.

But in between are extensive controversial areas. As policy in arriving at an account of existence we could do worse than to heed Ockham's razor, not to multiply what exists beyond necessity, which translates into: begin with those items which obviously exist, not-controversially, such as medium-size material objects, and close under enlargements produced by unavoidable extensions thereof, such as compounding or summation and dissection or analysis. But exclude unnecessary items, such as illusions, imaginary items, dream characters, and unnecessary operations, such as abstraction, idealization, fictional variation, and so forth. The route to an appropriately minimalist definition of existence is now evident. An item exists if it stands in suitable physical relations to the paradigm existents. (Such a definition is refined and synthesized with other accounts of existence in Routley 1980, Chapter 9.)" (pp. 261-263)

28. ———. 1991. "Relevant Logics." In *Handbook of Metaphysics and Ontology*, edited by Burkhardt, Hans and Smith, Barry, 787-789. Munich: Philosophia Verlag.

    "Relevant logics are both philosophically and mathematically motivated: but in both cases, a prime objective is to avoid paradoxes or incoherence, of one sort or another, a feat accomplished through restored or improved connections, especially relevant connection in implicational and inferential linkages. Relevant implications, the focus of most research, are those whose components (A and B in implication A → B) are relevant to one another, i.e. have enough to do with one another. Broadly relevant, or sociative logics assert none but relevant implications; all implicational theses of such logics are relevant implications. Under a technical explication (of weak relevance), relevant implications and logics are explained in the following way: a logic or logical system is relevant if its propositional part contains no theorems of the form A→ B where A and B fail to share a parameter. So any system which includes or validates paradoxes of implication - such as that contradictions imply everything and anything implies what is necessary (e.g. in standard symbols of the literature):

    A & ~ A → B, B →. C. v ~ C. A &~ A →. C & ~ C, etc.

    is irrelevant. Mainstream logics, such as classical and intuitionistic systems, are irrelevant.

    (...)

    "All these types of sociative logics have historical roots, most reaching back at least to medieval times. For example, semantical reasons for the serious qualification of Disjunctive Syllogism were anticipated in the 15th century by the Cologne School and Domingo de Soto; for they realized that where both A and ~ A hold (as in non-trivial inconsistent theories and many kinds of intensional situations), A does not exclude ~A,

A’s negation, so B's holding is in no way guaranteed. Generally, however, the historical connections were rediscovered later, after contemporary investigations had begun. In particular, technical studies of the best known of these sociative types, relevant logics proper, were well advanced before it was realized that some of the ideas (e.g. that relevant implication explicated genuine deducibility) were not quite so new, and that popular arguments against the theory appealing to the logical tradition could be matched by rival traditional arguments from dissenting schools. But certain recently neglected features of logical tradition - notably the requirements of preservation of relevance and necessity in an implication - were early seized upon by Anderson and Belnap (1975), who made these requirements central to their elaboration of entailment, as encapsulated in the system *E* (of ‘entailment’). To them we owe both the title ‘relevance logic’ and the main systems of relevance logics, a subclass of properly relevant logics in the vicinity of *E*, a system itself adapted from the (theorem-wise equivalent) system of ‘rigorous implication’ of W. Ackermann (1896-1962), who really initiated contemporary technical studies in 1956." (pp. 787-788)

    "Our modest aim is to show how, within a suitable relevant logical framework, all the paradoxes of confirmation vanish - not merely those Hempel and Carnap adduced, but those uncovered by Good, Goodman. Glymour, and others. But, naturally, even removing these paradoxes wholesale still leaves much logical work to be done, work we shall not try to complete here. What we shall indicate however, in the final section, is convergent work undertaken independently by Paul Weingartner and collaborators, which resolves paradoxes in an analogous fashion." (p. 5)

    (...)

    "To arrive at relevant logic and accompanying semantics of confirmation, we shall try to proceed from what is more secure (such as intersubstitutivity principles) to what is less (such as converse consequence conditions discussed by Hempel). In brief, we build up from weakness (as was the main Taoist-Cartesian methodological stratagem of RLR) rather than adopting the more difficult, if theorem wise intertwining, classical procedure of cutting down from damaging strength. The goal is, of course, a relevant logical theory free from paradoxes. Nonetheless, a subsidiary aim is to achieve substantially a *logical* theory, to accomplish as much as we reasonably can with logic alone, without undue appeal to outside distinctions or information (which may however enter in applications): in particular, without undue appeal to types of samples, or classes of conditionals or hypotheses, or "theoretically barren contexts" with no illicit background information, or "total available information.". 35. Sylvan, Richard. 1992. "On Interpreting Truth Tables and Relevant Truth Table Logic." *Notre Dame Journal of Formal Logic* no. 33:207-215.

    Abstract: "Contrary to common mythology, the two-valued truth tables do not yield classical logic. *Many* contestable assumptions are required to reach classical logic. Indeed *some* assumptions are required to get anywhere logically.

    In between, and in other directions, lie several other logics. For, even logically, there are many ways in which the truth tables can themselves be interpreted.

    In particular, they can be variously read inferentially, in one direction or two, or they may be variously read semantically. Along inferential lines, Tennant's one-way reading is reconsidered. It is argued that the tables

    do not lead to the logics Tennant claims to reach but can lead to various other decidedly weak logics. Along more orthodox semantical lines, it is shown how the truth tables themselves do not exclude nonclassical situations but can allow for incomplete and inconsistent set-ups. So considered, they provide the framework for a four-valued relevant logic. A four-valued implication is grafted onto this framework, simply by generalising upon two-valued material implication artifice, to deliver the familiar system *FDE* of tautological entailment. Finally, for comparison, a less contrived semantics than pure truth tabular, a semantics due to Dunn, which now admits of ready higher degree extension, is supplied for *FDE*."

36. ———. 1992. "Significant Moments in the Development of Australian Logic: in Critical Appreciation of Leonard Goddard's Major Contribution." *Logique et Analyse* no. 45:5-44.

    "Len Goddard not only initiated wider logical research in Australia, but further he had a major influence on the character and ethos of that investigation; for example, its easy, free-wheeling, unauthoritarian, undogmatic character. He encouraged features of what would now be regarded as logical pluralism of a relaxed and far-reaching kind. Not only were there many logical systems and frameworks worth investigating, some of course of more philosophical or technical merit than others; but more, he freely conceded that there may not be a unique correct one, or absolutely right way, among them. Nor, by contrast with common practice elsewhere, did he discourage heterodox logical work, even such unorthodox thought as that prevailing classical ways might be seriously defective, even downright wrong. To the contrary, he early thought that satisfactory resolutions of a range of paradoxes and puzzles should be sought outside entrenched ways; but he did not try to impose his own ideas or interests. In his own research at the time, which was (rather un-Australianly) nonconfrontational, he was certainly looking for resolutions of logical and semantical paradoxes outside formal classical logic - though by way of what had long stood at the peripheries of British logical investigations (from Mill through Russell and Ryle), namely significance theory and its contextual enlargements. More generally, there was no attempt, with Goddard as guide and director, to pull or push researchers into some standard line; on the contrary, they were encouraged to roam." (pp. 6-7)

37. ———. 1992. "Process and Action: Relevant Theory and Logics." *Studia Logica* no. 51:379-437.

    Abstract: "While *process* and *action* are fundamental notions, in ubiquitous use, they lack satisfactory logical treatment in two critical respects: in analyses of the fundamentals themselves and in logical development. For what treatment they have so far received, under classical systematisation, leaves significant

lacunae and induces much paradox. A relevant logical relocation, carried through in detail here, removes such problems, and provides solid ground-work for a satisfactory treatment.

Firstly, as to fundamentals: processes should be explicated, so it is argued, as certain sorts of (time) directed functions (from inputs to outputs); thus they can be represented through certain ordered pairs of relations. Significant logical structures they can enter into axe investigated: notably, process lattice and coupled logics, and a generalized category theory (tolerating nonassociativity of composition).

Actions are types of processes, agent-ascribed process. As stock analyses of the differentia, operators and agency, through intentionality, rationality and so on, demonstrably fail, new causal analyses are proposed.

Secondly, as to logical developments: for the most part, the apparently diverse offering of process and action logics to be encountered in the literature are but multiple modal logics: modal logics enriched with further functors of interesting modal sorts. Some, for example, like advertised "process logics" are dynamic logics (themselves basically multiple modal logics) enriched by tense logical functors, themselves modal in character. In a way that is now becoming nonstandardly standard, these modal enterprises can be reworked on relevant logical bases. A main point to such exercises resembles that of other relevant reworklngs: namely, the search for correctness, for adequacy to pre-analytic and linguistic data, and therewith removal of paradoxes and anomalies that accumulate under modal analyses.

Logical components from a properly expanded Humean model of action are supplied with relevant logics and semantics, in particular doing, trying and striving, intention and motivation. The difficult question of formalising practical inference is then addressed.

Relevant dynamic logics, paralleling modal developments, are built up piece by piece, relevant theory change is considered

within a dynamic framework, and work on relevant temporal and process logics of programming cast, including functors such as before, during and throughout, is initiated. The present state of logical play is assessed."

39. ———. 1992. "Blending Semantics for IF as a One-Place Assertive With Semantics for the Conditional." *Bulletin of the Section of Logic* no. 21:67-71.

    "According to the interesting theory of Miguel de Castro [2], the word `if' is not - what conventional logical theory sees it as - a two-place connective coupling a pair of sentences (e.g. even mildy deviant logicians like Belnap and Anderson take this line; see [1], p. 481). It is rather - what it often seems to be { a one-place functor, like its near relative *suppose* and like *would that, one wonders whether,* and many *wh*-expressions. Let us restrict consideration to the one-place *connective*, i.e. where *if* is sentence forming, so that, like ~ (for *not*), where *A* is a sentence so is *if A*.

    Under the one-place theory, the conventional form *if A (then) B*, symbolized *A* > *B*, plainly derives by compounding, through the two-place connective, ;,or *,then*. To make reading more straightforward, we shall assume then insertion (as argued for, in a distinguishing role, in [4] chapter). The formation rule for *,then i*s accordingly: where *A* and *B* are sentences (or wff) then so is *A,* then *B*. Thus *A* > *B* admits of syntactical analysis as: (if *A*), then *B*.

    What is demonstrated here is that this analysis can be extended smoothly to the semantical theory." (p. 67)

40. Sylvan, Richard, and Priest, Graham. 1992. "Simplified Semantics for Basic Relevant Logic." *Journal of Philosophical Logic* no. 21:217-232.

    "When Anderson and Belnap pioneered relevant logic, they proposed a number of systems (*E, R*, etc.) in proofs theoretic form. When suitable world-semantics for these systems were produced, it became clear that these systems were but the tip of an iceberg.

    Moreover, in the light of the semantics, it became clear that the basic (affixing) logic was none of those that Anderson and Belndp had suggested, but the system now called *B* (or *BM* if we drop all constraints

    on *). This had the most general semantics: other (affixing) systems being obtained by adding extra conditions on the ternary relation, *R*." (p. 217)

    (...)

    "In the first part of the paper we will consider the basic positive logic, B^+. In the second half we will consider negation-extensions of B^+. There are two strategies for handling negation in relevant logic: one uses the Routley *-operation; the other uses four-valued semantics (Routley *et al., loc. cit.*). We consider both approaches. The extant four-valued semantics for relevant logics contain a complication over and above constraints on R: they require two ternary relations (one to state truth conditions; the other to state falsity conditions). A feature of the present semantics is that only a single ternary relation is needed. Thus, the four-valued semantics are doubly simplified. Moreover, an interesting divergence emerges here. All negative systems add De Morgan laws to B^+. The basic negative system with the Routley * adds, in addition, contraposition; that for the four-valued semantics adds, instead, double negation. (*B* itself, adds both.)

    We concentrate in this paper on the semantics of the basic affixing relevant systems. It is clear that simplified semantics

for all (affixing) relevant logics, along the lines given here, are to be expected. But since details are not as straightforward as might be expected, we leave this topic for another occasion." (pp. 217-218)

41. Sylvan, Richard, and Hyde, Dominic. 1993. "Ubiquitous Vagueness Without Embarrassment: Logic Liberated and Fuzziness Defuzzed(i.e. Respectibilized)." *Acta Analytica*:7-29.

    Abstract: "Although puzzles surrounding vagueness are ancient, they have been much intensified since the rise of standard "classical" logic. A main trouble is that standard logic proceeds to "validate" both ancient defective arguments (sorites paradoxes) and modern defective arguments (modal paradox analogues). But much evidence has recently accumulated as to the severe philosophical inadequacy of standard logic. Plausibly then ways out of such logic-induced puzzles which work elsewhere, relevant ways which work well, will succeed with puzzles of vagueness also. So it proves, by letting the puzzles constrain the logic, so producing their own demise, we reach elegant logical resolutions with the "very" logics adopted elsewhere for removing other logic-induced problems."

42. Sylvan, Richard, and Urbas, Igor. 1993. "Paraconsistent Classical Logic." *Logique et Analyse* no. 36:3-24.

    Abstract: "The objective is to reformulate classical (prepositional) logic, preserving all theses, so that the spread rule A, ~ A / B, is avoided. There are many ways of doing this - some less, some more satisfactory, all exact formulations no doubt an improvement on standard classical logic. So results a cluster of paraconsistent classical logics. These systems are surveyed and rudimentarily classified, several of them separated, and some exhibited and discussed in more detail. Among the pure systems of the cluster are Hiz' s logic *H*, a Hilbert-style reformulation of Arruda-da Costa logic J_3, a cut-free formulation of Schütte's system K_1 and various normal-forming logics. Some of these pure systems fit Brasilian and Belgian criteria for paraconsistency very neatly, and significantly better than any Brasilian or Belgian systems."

44. Sylvan, Richard. 1995. "Re-Exploring Item-Theory. Object-Theory Liberalized, Pluralized and Simplified but Comprehensivized." *Grazer Philosophische Studien* no. 50:47-85.

Reprinted in R. Routley (Author), M. Eckert (ed.), *Exploring Meinong's Jungle and Beyond:*

The Sylvan Jungle — Volume 1 with Supplementary Essays, (2018), pp. 546-561.

Abstract: "Re-explored are certain item-theory theses, major problem zones, and newer puzzles and, together therewith, prospects for liberalizing and pluralizing item-theory. Undoubtedly item-theory may be further liberalized, partly by further dissociation from object-theory and the restrictions *object* imposes, but primarily through substantial deregulation of the styles of characterisations permitted. Then almost anything goes; nonetheless what results is a sufficiently well-organised smooth-running sistological anarchism.

Characterisation is dispersed through a federation of regions: only in old central city regions do the characterisation postulates of older object-theory regularly hold; in the expanding suburbs characterisation by local assumption and postulation (as in neutral postulate-theory) is a distinctive mode, while out in the country implicit intentional characterisation (including ostension and perception, dreaming and imagining) is a common mode. Put differently, there is a rich variety of sources yielding item specifications; only in places like the old city do structural descriptions of items enjoy formerly-imagined priority, but elsewhere alternative characterization principles may operate.

However what holds in situations as a result of such local or regional characterisation may be far removed from what is actual. Characters may be only make-believe or suppositional presented character may differ from more genuine articles, and so on. Bringing the items involved into central evaluation

markets, where truth value is assessed, may require preparation of the items, with pruning or regularisation of their properties. Here, at this semantical stage, full pluralization offers further freedom, that is pluralization of truth, with a plurality of actual worlds. A single assignment of truth, *the* truth at the actual world, is no longer *de rigueur*; a truth net may be differently cast, different assignments may be adopted, and a selection among alternatives perhaps made. Within this liberalized pluralized setting, resolutions of puzzles induced by certain problem-making items are ventured."

45. ———. 1995. "Freedom Without Determinism: Decent Logics of Relevance and Necessity Applied to Problems of Free Will." *Acta Analytica*:7-32.

    Abstract: "Arguments for determinism do not enjoy the sound logical health that has been attributed to them. The main older argument is fallacious, indeed classically invalid, while a new "rectified" form is relevantly invalid (relying on modally covered form of disjunctive syllogism). What is more, there is no satisfactory way of repairing this form of argument so that it does yield a credible determinism. Other arguments for (non-vacuous) determinism are also dispatched, through a divide-and-dissolve technique, which operates by distinguishing types of determinism (such as logical determinism, which depends on another modal fallacy) and kinds of arguments for determinism (such as rational choice arguments, which inadmissibly assume maximization, and reductionistic arguments, which inadmissibly assume full reduction of choice and deliberation succeeds). In the largest of three appendices (the other two concern logical developments), a reasonable libertarianism is discerned and defended."

From the Note by Nicholas Griffin:

"When Richard Sylvan died in June 1996 the manuscript of this book was already complete. It is true, to take up one of the themes put forward in its pages, that `complete' in this context is not an absolute term: while one typescript was with his publisher at the time of his death, another, bearing further revisions, was with his typist. The changes he made at this time, however, were minor and only the bibliography and references have required much attention from me." (p. XIV)

Contents:

Prologue: Complaints and Acknowledgements XI; Note by Nicholas Griffin XIV; General description and synopsis XV;

I. Basic theory

1. Introducing and placing Full and Deep Plurallisms 3; 2. Explaining full metaphysical Plurallisms: their features, their differences 18;

II. Arguments

3. Paths and arguments leading to Deep Plurallism: *Vias Negationis* 39; 4. More arguments to Deep Plurallism: *Via Positivas* 61; 5. Still more positive arguments to Plurallism 93;

III. Theory elaborations

6. Worlds and Wholes: their natures and relevant features 141; 7. Talking and thinking Plurallese as well as more ordinarily: modellings and discourse for and under Plurallism 175; 8. Making a wider metaphysical sweep: traditional notions. Traditional pluralism. Traditional objections 227;

IV: Comparisons

9. Distancing Plurallism from Realism, Anti-Realism and Relativism, and those other isms 259; 10. Plurallistic investigation of Relevant philosophers and philosophical Schools 299;

V. Outcomes

11. Impacts upon philosophy: harmonious applications and further problem-solving 351; 12. What Deep Plurallism does, its intellectual impact, and where it leads 409;

Epilogue. Beyond Intellectual Plurallism -- to Liberating Practice 455; Endnotes 467; Bibliography 507; Index 519-525.

"General description of Form and Content of *Transcendental Metaphysics*.

There is not merely a plurality of correct theories and of more or less satisfactory world-views: there is a corresponding plurality of actual worlds. Plurality penetrates deeper in full

plurallism than linguistic surface or than conceptual or theoretical structure, to worlds. There is no unique actual world such as realism postulates, but many worlds; there is no single fact of the matter, there are facts and matters. Full plurallism itself bifurcates, into two main forms; radical pluralism, which rests with multiple actual worlds, and *deep* plurallism, which `completes' this multiplicity with a unifying ultimate item, the Wholle, of which the multiplicity comprises various worldifications. Much of the text is devoted to the theoretical elaboration and defence of deep plurallism, both directly and by comparison with past positions.

Overall structure of the book (which is as shown by its short content) is, in brief, as follows: The basic theory is introduced and explained, and several confusions offset. Arguments against the radical theory are deflected and then many arguments for it are advanced. Following that detailed stage, deep plurallism and other pluralisms are further elaborated, in part through a detailed investigation of key notions, both of full plurallisms and also from traditional and religious pluralisms. Next the full theory is set in place through a series of comparisons: firstly with the other standard philosophical positions in realist-idealist-relativist and related debates, and secondly with connected development of many worlds theories and transcendental metaphysics of other philosophers. There too it is demonstrated that deep plurallism is not merely a metaphysics, but one that is transcendental, and various arguments against transcendental metaphysics are repelled. Finally full plurallism is put through its paces, in showing its power in resolving or relocating major philosophical problems, and further in dislodging powerful prevailing ideologies. In a brief epilogue, full plurallism is linked to practice. For instance, its decided merits as regards liberality and tolerance are explained.

Considered one way, the basic theory defended and developed can be seen as a plural realism, with central thesis that actuality is plural, more concretely that there are many actual worlds, not a unique one. Radical plurallism, which is pluralism at this actual world stage, not merely at a theoretical or conceptual

scheme level, thus resembles realism, simply as (what is strictly impossible) pluralized. Deep plurallism does more, as it includes at least a nonworldy nondescript transcendental item in addition. From such world pluralism, however augmented, plurality of many other critical notions follows, notably of truth and evidence, truth for instance amounting to what holds at an actual world (of which there are very many).

However the basic theory can be alternatively seen not as a realism at all, because many apparently central themes of both ordinary realism and scientific realism are repudiated (e.g. respectively, uniqueness of the external world, and that that world is substantially as dominant science asserts, with all the existential trappings it alleges and none other). Alternatively again, it may be viewed as an antirealism, because for instance of its rejection, along with contemporary anti-realism, of the stock realist theme that there is a unique recognition-independent reality (or, on a lesser count, because of its questioning of classical bivalence and other truth-value principles). Nonetheless such an assimilation has, like others, limited plausibility, because full plurallism acknowledges many recognition-independent (perceiver and mind transcendent) actual worlds. Alternatively again, full plurallism may be regarded as mere relativism, because of its commitment to - what is less than relativism - relativity principles, for instance that truth is relative to actual world, and therefore is structurally relative. Whereupon it may be wrongly supposed that plurallism, like undiscriminating relativism, is self-refuting. Again, however, such a relativistic comparison is seriously defective - unless quite atypical, much more discriminating relativisms are envisaged. For by no means all positions are admissible, still less equally good. In plurallism there remain both internal and external checks upon adequacy and correctness: but, checks and balances that do not effect unique semantical selections.

Central to pluralistic enterprise (as opposed to fashionable relativism) are arguments, and therefore matters of logic and rival logics. Main arguments for full plurallism begin from plural logical theory, which is pivotal to all rational inquiry.

Several different arguments are advanced for the plurality of correct theories; and it is argued from there through correspondence, or directly, to the plurality of actual worlds. Several coupled arguments from methodology are also developed. Stock arguments from rival one (actual) world positions are duly disabled.

Deep plurallism has large corollaries, for intellectual theory and practice, both inside and outside philosophy. To take one example: as it affords a comparatively easy way between the rocks of realism and relativism, so it affords a way between acceptation and rejection of science, of rationality, and more generally of the Enlightenment Project. There is no unique correct Science such as that the Enlightment postulated; but there are various sciences, where not everything goes.

In place of certified logic stands not no logic, but a plurality of logics, including more than one correct logic. Similarly in place of reason and rationality stands not nothing, not a rejection of reason and rational methods, but a pluralization of them (with prominent correct methods rejecting received modern maximization and consistency imperatives). In place of the truth stands not nothing, nihilism, no court of appeal regarding correctness, but several: pluralistic truth. In place of the Enlightenment stands not a return to earlier (and subsequent) dark ages, but a plurallistic flowering, into enlightenments." (pp. XV-XVI)

56. ———. 1997. "Relevant Conditionals, and Relevant Application Thereof." In *Logic, Language and Computation*, edited by Akama, Seiki, 191-244. Dordrecht: Kluwer.

"All that is required for validity of an implication in classical logic is that it be impossible for all the antecedents to be true and the consequent false. (Similarly, with terminology adapted, for validity of inferences.)

This requirement makes all implications with inconsistent antecedents valid. According to relevant logic, more should be required. That more can be explained in various equivalent ways. One is a classical look-alike; that the antecedents be genuinely inconsistent with the negation of the consequent.

According to another look-like, truth should be preserved everywhere (including in impossible situations), that is, in whatever situation the antecedents hold so should the consequent. Another, perhaps more revealing, is as follows: not only should it be impossible for the antecedents to be true and the consequent false in a valid implication, but the antecedents and the consequent should also have something in common, or, in other words, the antecedents should be in some way relevant to the consequent. Whence the name relevant or relevance logic.

Relevance itself means, firstly: bearing upon the matter in hand or the point at issue. A statement, a consideration, or the like, that is said to be relevant, must be understood to be relevant to something, i.e.

relevance is always relational. Relevance matters in a wide variety of settings: in statistics (where a defective explication of relevance in terms of alteration of probability is regularly advanced); wherever evidence

is assessed, as in law; in rules of relevance for conduct of meetings; in procedures for selection, as in organisation, where what is selected should enjoy relevant features. As well, relevance has recently assumed

importance in linguistic and pragmatic investigations as to discourse and communication, owing partly to the Grice's widely accepted directive for admissible discourse, Be relevant!, and partly to the associated

theme that most, even all, connectives of ordinary discourse exhibit relevance (i.e. for connector C, where pCq then q is relevant to p)." (p. 192)

57. Routley, Richard, and Copeland, Jack. 1999. "Beyond the Universal Turing Machine." *Australasian Journal of Philosophy* no. 77:46-66.

Two of our heresies--in the dictionary sense of 'opinions contrary to the accepted

doctrine on any subject'--are these)(1)

Proposition 1. The so-called Church-Turing thesis is false.

The so-called Church-Turing thesis purports to draw a borderline between computability and non-computability and is, it seems, pretty well universally accepted among computer scientists, cognitive scientists, and philosophers of mind. In point of fact neither Turing nor Church endorses, or even states, this thesis. Their theses, proved equivalent by Turing, concerned the functions that are in principle computable by an

idealised human being unaided by machinery. Careful authors do use the term 'Church-Turing thesis' to refer to one or other of the various equivalent forms of the theses that Church and Turing themselves put forward. Proposition 1. concerns not that equivalence class of theses but a claim lying outside the class and widely but improperly termed 'the Church-Turing thesis'. We distinguish this thesis from members of the

equivalence class by the use of riders such as 'so-called'. The so-called Church-Turing thesis is the claim that the class of well-defined computations is exhausted by the computations that can be carried out by Turing machines.

Proposition 2. Computability is a relative notion, not an absolute one.

There is no such thing as the class of well-defined computations. The extent of the computable functions is resource-relative." (p. 46)

(...)

"In the present paper we focus largely on proposition 1. although much of what we say also bears intimately on proposition 2. Proposition 2. receives further discussion elsewhere (Sylvan and Copeland 199-)." (p. 47)

(1) Richard Sylvan did not live to see this paper written. He contributed a draft of section VIII and fragments of sections I, II and IX. Our collaboration began in August 1994, when Richard became interested in my descriptions of machines forbidden by the so-called Church-Turing thesis, and I in his ideas concerning the extent to which one's notion of

computability is relative to one's logic (the topic of Sylvan and Copeland 199-).

58. Sylvan, Richard. 1999. "What is that Item Designated Negation?" In *What Is Negation?*, edited by Gabbay, Dov and Wansing, Heinrich, 299-324. Dordrecht: Kluwer.

    "Regrettably current logical orthodoxy is astray on negation, perhaps more seriously astray about negation than elsewhere. Unfortunately most of the advertised logical and linguistic alternatives to or elaborations upon classical orthodoxy are wrong also. A more engaging story needs to be told, upon which what follows represents some sort of bumbling beginning.

    Negation is an item, an operation which is both one (one determinable which, though widely used, is far from orthodox) and many (having many determinates).

    A prime determinate (which proves adequate on its own) is a relevant negation which applies both to sentences and to their unsaturated parts such as predicates.

    By contrast, the classical sentence negation of orthodoxy represents but a degenerate determinate, not widely used in normal discourse (for such discourse does not sustain irrelevant inferences, such as from a pair A and not-A to any statement whatsoever, etc.)." (p. 299)

    On the title: "Much searching went into trying to find a satisfactory term to distinguish these logics. The eventually adopted term, *sociative,* derived through French from the Latin *sociare*: 'to combine, unite, etc.' and *socius* 'companion'. It now

means 'expressing or denoting association, conjunction, union': see *Oxford English Dictionary*. Occasionally, the now obsolete English noun, verb and participle, *sociare,* will also be deployed." (Note 31, p. 29)

"Chapter 5. A Preliminary Western History of Sociative Logics

This essay originally appeared in 1989 as chapter 4 of BG. [Editors]

Contemporary logical investigations enjoy the advantage of vastly improved logical technology as compared with all earlier terrestrial times. Yet, by comparison with earlier periods of high logical activity, the twentieth century is anomalous in its heavy mainline concentration upon classical logic, and, as a result, appears stodgy and unadventurous. For the deadening effect of the wide educational imposition of a narrow and intellectually disastrous dominant logical paradigm, classical logical theory, has (again) destroyed much logical expression and adventure. Rival logics have become very much a minority and esoteric activity, not even incidental to the serious affairs of life; no longer do even the city crows converse over logical issues. The full flourishing of sociative logics, in their rich variety, has yet to occur.

So far as we know, there have been three main periods in the long history of Western logic when the central issues of logic, as to what makes an argument valid, when deducibility obtains, and whether these connections can be captured in true or necessary conditionals, have been vigorously discussed. The periods are these: around the third century BC when Stoic logic flourished, in the medieval period, especially the twelfth century AD, and in the present century.

The logical investigations carried out in these three significant periods are, thus far, substantially independent. The Stoic enterprise of the third century exerted little or no influence on medieval thought, and indeed details (such as they are in Sextus Empiricus) were not available until after the seminal work of Abaelard's school and rival schools had already been accomplished. Of the main contemporary strands of sociative

logic, only connexive and nontransitive logics have clear historical representation, and even there main investigations have proceeded substantially independently of historical inputs. When history has been appealed to in support of relevance logics, for example, it has been rather peripheral and, too often, historically dubious.

Though the main historical settings for sociative logic presupposed a heavy consistency assumption (in particular throughout medieval times), and though paraconsistent logics tend to be missing in expected areas of application (such as treatment of semantical paradoxes), nonetheless the history of sociative logics is deeply interwoven with that of paraconsistent logics. One major reason for the intertwining is of course that a crucial issue for sociative logics is what-by contrast with strict and classical spread and collapse-happens with impossible premisses and assumptions. How is loss of connections to be avoided there? A special section of the theory of obligationes (or suppositional reasoning and commitment) was devoted to this issue in the Middle Ages; and a similar division of research, plainly parasitic on classical logic however, can be seen in contemporary North American research (such as that of Rescher and Brandom and of Woods and Walton). These pretty unsatisfactory ways of shunting off, and sidetracking, significant logical problems fortunately by no means exhaust feasible lines of approach, as the rich history of paraconsistent logics helps disclose. That history has already been documented, admittedly also in a very preliminary fashion, elsewhere (especially in PL *[Paraconsistent Logic*, 1989] and its extract OP [*On Paraconsistency,* 1983]*,* which should be read in conjunction with this material - conversely, this material enriches *Paraconsistent Logic,* which is scanty on several topics of relevant interest). The entertaining story, which overlaps and complements the history of sociative logics, will not be repeated, but elements of it will be drawn upon where appropriate (and readers who seek a fuller picture to begin upon their own investigations should consult that story, as well as, of course, but cautiously, standard texts)." (pp. 53-54)

60. Brady, Ross, ed. 2003. *Relevant Logics and Their Rivals: Volume II. A Continuation of the Work of Richard Sylvan, Robert Meyer, Val Plumwood and Ross Brady*. Aldershot: Ashgate.

    With contributions by Martin Bunder, André Fuhrmann, Andéa Loparic, Edwin Mares, Chris Mortensen, Alasdair Urquhart.

    Contents: List of Contributors VIII; List of Figures IX; Preface XI; Prologue by Ross Brady 1; 6. Non-normal relevant systems by Richard Sylvan and Val Plumwood 10; 7. Multiplying connectives and multiply intensional logics by Richard Sylvan, Robert Meyer and Val Plumwood 17; 8. Operational semantics by Richard Sylvan and Val Plumwood 38; 9. The algebraic analysis of relevant affixing systems by Richard Sylvan, Robert Meyer, Ross Brady, Chris Mortensen and Val Plumwood 72; 10. The more general semantical theory of implication and conditionality 141; 11. Recent developments I by Ross Brady 192; 12. Recent developments II by Ross Brady 231; 13. On quantified relevant logics by Ross Brady 309; Appendix: Extensional reduction II by Robert Meyer and Richard Sylvan 352; Bibliography 408; Index 421-425.

    "The main writing work, for the two volumes, was done by Richard Routley, making essential use of work of Meyer, Plumwood and Brady in the process. The second volume was also to include Chris Mortensen at least for his work on the algebraic analysis of relevant affixing logics. Moreover, Richard remained the driving force behind the Relevant Logics and their Rivals volumes, providing the layout and material for an integrated work. During the time of writing, Richard had sent most of the chapters to a number of people for comment. However, some of these chapters, earmarked for the second volume, were more complete than others, and four of the tentative chapters (i.e. chapters 10 and 13-15), being fairly incomplete, were not sent out at all.

    However, subsequent to the publication of the first volume, there was quite some delay in getting the second volume together, mainly because Richard Sylvan was heavily involved in environmental philosophy and had other interests, both

academic and non-academic. Richard made a number of attempts to restart the book, usually by contacting the other authors, but these contacts did not reap much progress. In 1985, he had more or less given up on the chapters of the tentative contents. Richard had subsequently persisted with the idea of rewriting the second volume to bring it more into line with his recent thinking, since the early work of the 1970's was starting to date in relation to more recent advances. He made a start on this revision around 1988-9, producing a number of short separate pieces, which were hard to connect to the chapters previously sent round for comment. Thus, it would be hard to make much use of these pieces in this book, if one relied on the chapters of the tentative contents for guidance.

Unfortunately, Richard died unexpectedly in 1996, at the age of 60, leaving a plethora of unfinished work.

(...)

Upon initial examination of Richard's chapters 6-15, including his relevant archival material, I found that while a lot of it was in good shape for publication, much of the remainder was incomplete, sketchy or inaccurate. This is not entirely unexpected, given the circumstances. Nevertheless, I was put into the dilemma of either trying to complete it as best as I could, in accordance with the tentative contents, or inserting more up-to-date material. The main difficulty about the first approach is the age of the material, since it was done during a period of greater logical experimentation than seems appropriate nowadays, together with the advent of newer developments in the relevant logic area.

So, I have generally proceeded with the second approach by extending Richard's material into some new directions which cover the period from the time of publication of the first volume to the present. Given that Richard was interested in updating the original chapters 6-15 anyway, I feel this second approach is not entirely inappropriate nor against his wishes. I have also been ably assisted in this task by Martin Bunder, Ed Mares, Andre' Fuhrmann, Chris Mortensen and Alasdair Urquhart,

who have given me some accounts of their recent work for inclusion.

In this way, much of Richard's work and that of his co-workers, whose Work was interwoven into Richard's material, will be maintained for posterity as an important contribution to logic, upon which others may choose to build." (pp. XI-XIII)

61. Sylvan, Richard. 2003. "The Importance of Nonexistent Objects and of Intensionality in Mathematics." *Philosophia Mathematica* no. 11:20-52.

With a foreword by Nicholas Griffin (pp. 16-19).

This "is a reprinting, with as little change as feasible from the original typescript, of most of Chapter 10 and the introduction and first section of Chapter 11 of Richard Routley (who changed his name to Sylvan in 1985), *Exploring Meinong's Jungle and Beyond: An Investigation of Noneism and the Theory of Items*, published by the Philosophy Department of the Research School of Social Sciences of the Australian National University, Canberra, 1980, and still available from it (ISBN 0-909596-36-0)."

"The more comprehensive case for the importance of nonentities includes, as especially significant, their role in mathematics and their roles in the theoretical explanations of science-the whole business, that is, of appealing to ideal simplified objects, which suitably approximate real objects, in problem solving and theoretical explanation. More generally, the theoretical sciences are seriously nonreferential, both in having as their primary subject matter nonentities, and in being ineradicably intensional. This thesis runs entirely counter to empiricist philosophies of science, which have long dominated the subject (to its detriment), according to which the language of science is, or ought to be, referential. Empiricist thinkers have, until very recently,' regarded the citadel of science as exclusively theirs: and the main goals of philosophy, as they conceive them, have been determined by the defense and extensions of the citadel to increase its power over the intellectual landscape. Thus they have taken the language of science, properly refined referentially of course, as the ideal of

language, to which much ordinary language is at best a shabby first approximation; and they have characteristically seen philosophy as the handmaiden of science, as like a servant clearing away rubbish in the way of scientific progress or questioning scientific practice and values, or as a subsidiary scientific activity of conceptual analysis and reconstruction aiding the defense or advance of total science. A basic assumption in all this, without which much of the superstructure collapses, is that both the language of science and scientific theories conform to empiricist canons: the assumption is false-so at least it is now argued. The case begins by considering mathematics, which forms an integral part of much theoretical science."

68. Beall, Jc, Brady, Ross, Dunn, J. Michael, Hazen, A. P., Mares, Edwin, Meyer, Robert K., Priest, Graham, Restall, Greg, Ripley, David, Slaney, John, and Sylvan, Richard. 2012. "On the Ternary Relation and Conditionality." *Journal of Philosophical Logic* no. 41:595-612.

    Abstract: "One of the most dominant approaches to semantics for relevant (and many paraconsistent) logics is the Routley–Meyer semantics involving a ternary relation on points. To some (many?), this ternary relation has seemed like a technical trick devoid of an intuitively appealing philosophical story that connects it up with conditionality in general. In this paper, we respond to this worry by providing three different philosophical accounts of the ternary relation that correspond to three conceptions of conditionality. We close by briefly discussing a general conception of conditionality that may unify the three given conceptions."

    "This paper emerged from some working sessions at the University of Melbourne in 2009.

    Beall, Brady, Hazen, Priest, Restall, Ripley, and Slaney were involved *on the ground*. The work of Dunn and Mares kept coming up during the sessions, and the paper greatly benefited from their joining the effort after the event. Looming even larger in the initial discussions were two others: despite their deaths, much of the early work of Sylvan and Meyer was heavily represented. While we can't speak for the current views of Bob (Meyer) or Richard (Sylvan), we wanted to honor them for their starting this ternary-relation idea in the first place. Hence, we include them as authors. While not all of us (authors) agree on all ideas herein, we do agree with the main thrust of this paper: namely, that, despite first appearances, the ternary-relation

approach to conditionality is very much philosophically plausible as capturing an important aspect of conditionality." (p. 595)

69. Routley, Richard. 2018. *Exploring Meinong's Jungle and Beyond: The Sylvan Jungle — Volume 1 with Supplementary Essays*. Cham (Switzerland): Springer.

    Edited by Maureen Eckert.

    "Thus Sylvan argues that his neo-Meinongian, so-called "noneist" (pronounced *none-ist*), theory at the heart of the Jungle Book casts new light on supposed long-standing problems like the problem of universals, perception, intentionality, substance, self, and values. Chapters are devoted to metaphysical and associated epistemological problemsthat emerge in the philosophy of mathematics and philosophy of science, to developing a satisfactory epistemology more generally, to providing an adequate semantic account of fictional discourse, to an analysis and rejection of Russell's theory of descriptions and of Quine's objections to broadly-Meinongian approaches, and so on. The book's size matches its ambitions. And the book's author was a man of considerable intellectual ambition. (pp- XIII-XIV, Introduction by Dominic Hyde)

    Transcription by Nicholas Ferenz of an unpublished manuscript.

    "Semantical analyses are provided for several intensional logics, in particular for (substantial parts of) the systems R of relevant implication, □R of relevant implication with necessity, P of ticket entailment, and E of entailment, and what is the same theory as E the system Π of rigorous implication. The analyses provided are used to provide semantical completeness results and decidability results for the main systems discussed,

and are applied to settle some of the open questions concerning E and R and their fragments." (p. 212)

71. ———. 2019. *Ultralogic as Universal? The Sylvan Jungle — Volume 4 with notes and commentaries*. Cham (Switzerland): Springer.

    Edited by Zach Weber.

    "Ultralogic is important not least because it boldly advances the value of inconsistent theories, especially in mathematics. Routley urges that consistency is not always the ultimate arbiter of correctness, that some contradictions can be true, a thesis now known as dialetheism. While Priest's works have become the canonical texts for dialetheism, without Routley, dialetheism would not be what it now is. It was the happy meeting of Priest and Routley in the 1970s that looks to have been the spark." (*Editor's Introductio*n, p. XIII)

    Edited by Domini Hyde.

    "With the perspective afforded by time, Richard Sylvan, nè Routley (1935-1996), will, I believe, come to be seen as the most important Australasian philosopher of the 20th Century. This is not at all to denigrate his currently better known compatriot contemporaries: a number of these made highly significant contributions to philosophy. But what set Richard apart was the originality he deployed and the scope of his vision. He made original contributions to logic, metaphysics, the philosophy of language, value theory, environmental philosophy, political philosophy. Moreover, though he never wrote anything that integrated all of these, it is clear to those who know his work that his views on all these matters formed part of an overall and

systematic philosophical picture." (*Introduction: some personal reflections* by Graham Priest, p. XIII)

Bibliography

1. Besoli, Stefano. 1984. "Convergences and Diversities between Noneism and Gegenstandstheorie." *Grazer Philosophische Studien* no. 21:133-153.

   "The problems that give rise to the conceptual system developed by Routley(1) are largely those suggested by the proposals contained in Meinong's *Gegenstandstheorie* . By taking up these themes again Routley wishes to legitimate an ideal resumption, a radicalization and an expansion of a number of theses peculiar to Meinongian doctrine. Starting from this remark, he is then led to deal explicitly with the limits of the internal presupposition of classical logic, putting forward, by contrast, the advantages of a recomprehension which attempts to bring to light the logical/ontological topics generally neglected or, rat her, reductionalistically interpreted within the framework of a Russellian theory of logic. The author's constant appeal to a neutral ontology which is close, but not identical, to Meinong's range of *Außersein* permeates his entire work and supports the emergence of an idoneous theory of items. The *Leitfaden* is the refutation of Standard Reference Theory (RT) which is the paradigmatic core common empiricism, idealism and materialism, but which also underlies extensionally quantified orthodox logic.

   Reference Theory (RT) requires, as an essential condition, that truth and meaning are rigid functions of reference. The original

aim of Routley's analysis is to eliminate the prejudice in favour of immediate actuality which is inherent in every referential view. Accordingly, it must be possible to make semantically relevant the occurrence of non-referential statements.

Meinong's philosophical work, together with the influential theories of Th. Reid, suggests the inescapable clauses for a gnosiological alternative which will not relapse into platonism." (p. 133)

(1) We refer mainly to Routley's *Exploring Meinong's Jungle* , Canberra, 1980, where he gives an enlarged draft of conceptual trends established long ago.

2. Brady, Ross T. 1980. "Two Remarks on *The Logic of Significance and Context* ." *Notre Dame Journal of Formal Logic* no. 21:263-272.

"I wish to make two remarks on two points that Goddard and Routley made in Chapter 5 of their book, *The Logic of Significance and Context* [6].

The first remark is that the Brady disjunction, 'V',(1) does have applications in ordinary discourse, in answer to the doubts about this expressed by them on pp. 344-5 of [6]. I will defend this position, which I originally made in [1] on p. 30, and also in [2], pp. 172-3, by showing that each of four examples can be interpreted in a way which requires 'V to be used in its formalization. The second remark is that the need for a functionally complete significance logic such as their system $\mathbf{S}_5$ (or $\mathbf{S}_6$) seems very limited. I show this by examining each of their five arguments for a functionally complete system on pp. 348-351 of [6] and by showing how their weaker significance-complete (for definition, see [6], p. 326) system $\mathbf{S}_3$ (or $\mathbf{S}_4$) will suffice, except in exceptional circumstances, to express what they suppose a functionally complete system is needed for." (p. 263)

(1) The symbols and terminology for this paper are taken from Goddard and Routley [6].

3. Bradley, Michael. 1978. "On the alleged need for nonsense." *Australasian Journal of Philosophy* no. 56:203-218.

"The theory, stemming from Russell, that there are grammatical sentences of English, containing only recognised English vocabulary, which are nevertheless meaningless is a familiar landmark of contemporary Philosophy.

(...)

In recent years, however, the case for the non-significant has been taken up again. In a series of closely argued papers Ross Brady, Leonard Goddard and Richard Routley have urged the necessity for nonsense, and the latter two authors have developed (in [3]) a logic of significance whose justification is largely the supposed need for nonsense. In this paper I examine their reasons for alleging the need, and conclude that they have not established a case.

Because of the extent of the collaboration and agreement between the authors cited it as often pointless to refer a view to one rather than another. In such cases I use the phrase 'our authors'. In other cases where more accuracy seems called for, one or two of them are referred to by name.

Our authors call 'falsidal' those theories which treat sentences such as 'Virtue is square' and 'I likes dancing' as faIse ([1], p. 213; [11], p. 368). They describe and criticise various versions of the falsidal approach, and find all of them deficient. What I wish to propose is a non-arbitrary and epistemologically satisfactory falsidal theory which escapes the difficulties of other versions. I shall only try to assess the arguments given by

our authors so far as they seem or are claimed to bear on the falsidal theory which I am

going to propose. These arguments are scattered through a number of places and often conjoined with material not germane to the present task. I have tried to abstract the strongest and clearest exposition of all ma (pp. 203-204)terial I think relevant. Not all the relevant writings by our three authors are mentioned in my bibliography, but only those drawn on. Others will be found detailed in the bibliography to [11], and further relevant material in the notes to [1] and [10]." (pp. 203-204)

Abstract: "Richard Sylvan (né Routley) was one of Australasia's most prolific and systematic philosophers. Though known for his innovative work in logic and metaphysics. the astonishing breadth of his philosophical endeavours included almost all reaches of philosophy. Taking the view that very basic assumptions of mainstream philosophy were fundamentally mistaken, he sought radical change across a wide range of theories. However, his view of the centrality of logic and recognition of the possibilities opened up by logical innovation in the fundamental areas of metaphysics resulted in his working primarily in these two, closely connected fields. It is

this work in logic and metaphysics that is the main focus of what follows."

5. Kielkopf, Charles. 1974. "Critique of the Routley's First Degree Semantics." *Australasian Journal of Philosophy* no. 52:105-120.

   "R. and V. Routley's 'The Semantics of First Degree Entailment '(1) is a clear, careful, but relatively non-technical presentation of a semantics for Anderson and Belnap's so-called tautological entailments. Their paper is a valuable introduction to a treatment of negation in semantics for relevant logics and entailment systems. However, the Routleys' paper is primarily an attempt to build a case for accepting as valid only the first degree inferences warranted by the tautological entailments instead of the much larger class warranted by the tautologies of classical propositional logic. I adapt terminology of the Routleys' to call the tautological entailments, and the first degree inferences warranted by them, *FD* logic. The Routleys' semantics for *FD* logic is a special case of semantics for relevant logics(2) whose first degree fragment is the

   tautological entailments. In my argument, I shall only sketch the basic idea of their semantics for *FD* logic since I shall not be concerned with technical uses of the semantics for results Such as completeness. I shall argue that the Routleys' semantics for *FD* logic does not justify switching from classical to *FD* logic. However, I shall recommend using their semantics for uncovering tautologies needed, in a special sense of 'needed', in classically valid inferences." (p. 105)

   (...)

   "Indeed, I hope that I have shown that the Routleys, despite their intriguing semantics and illuminating discussion of suppression, have given no good reasons for switching from classical to *FD* logic." (p. 120)

   (1) *Noûs* 6 (1972) pp. 335-59. All references, unless otherwise specified are to this paper.

(1973) pp. 192-243; 'The Semantics of Entailment-lI,' *Journal of Philosophical Logic* (1972) pp. 53-73; 'The Semantics of Entailment-III,' ibid. pp. 192-203. Section 5 of R. Routley's 'A Semantical Analysis of Implicational System I and of the First Degree of Entailment', *Mathematische Annalen* 196 (1972) pp. 58-84, is especially helpful for showing that the set-up semantics to be considered here are semantics for the tautological entailments.

6. Lewis, David K. 1990. "Noneim or Allism?" *Mind* no. 99:23-31.

   Reprinted in: D. Lewis, *Papers in Metaphysics and Epistemology,* Cambridge: Cambridge University Press, 1999, pp. 152-163.

   "Some few entities - present, actual, particular, spatiotemporal, material, well-bounded things - exist uncontroversially. Scarcely any philosopher denies them. Other alleged entities are controversial: some

   say they exist, some say they do not. These controversial entities include past and future things, the dead who have ceased to be and those who are not yet even conceived; unactualized possibilia; universals,

   numbers, and classes; and Meinongian objects, incomplete or inconsistent or both. An expansive friend of the entities who says that all these entities exist may be called an *allist* . A tough desert-dweller who

   says that none of them exist may be called a *noneist* . In between come most of us, the pickers and choosers, *some-but-only-someists* .

   Richard Routley declares himself a noneist.(1)1 If we may take him at his word, he holds that none of the controversial entities exist. But ay we take him at his word?" (p. 23)

   "In short: we dispense with existence - but heed what this means and what it does not. Of course we do not dispense with the word 'exist' as one of our pronunciations for the quantifier. Neither do we dispense with a trivially universal predicate of existence, automatically satisfied by absolutely everything. But

if 'existence' is understood so that it can be a substantive thesis that only some of the things there are exist - or, for that matter, so that it can be a substantive thesis that everying exists - we will have none of it." (p. 31, a note omitted)

(1) Richard Routley, *Exploring Meinong's Jungle and Beyond: An Investigation of Noneism and the Theory ef Items* (Australian National University, 1980). For short: *Jungle* . Routley, as he then was, is now Richard Sylvan, but I shall refer to him by the name under which the book was written.

7. Meyer, Robert K. 1998. "In Memoriam: Richar (Routley) Sylvan 1935-1996)." *The Bulletin of Symbolic Logic* no. 4:338-340.

"Besides free logic and his work on Meinong, Sylvan was an important contributor to the development of paraconsistent ideas, already in the first degree semantical work with Val Plumwood cited above. This work led him into important collaborations with other logicians, as did his work on relevant logics and on a number of other subjects. Besides those mentioned elsewhere in this note, among Sylvan's important logical collaborators were Nicholas Griffin, Graham Priest, Ayda Arruda, Dominic Hyde and Jean Norman.

Richard continually applied (and was continually turned down) for promotion to full Professor at ANU [Australian National University]. It is probably not irrelevant that, in all his enterprises, he almost never chose the easy or popular course. His enthusiasms–logical, intellectual and political–were for the alternative. To get the counter-suggestible Sylvan to defend some view, a good move was to remark that the view was now utterly discredited.

So Richard Sylvan is gone. It's hard to believe; it would be in character for him to be fooling us, spreading the rumour of his death for some deep Sylvanesque purpose. I personally miss him very, very much. When my own career was in ashes, it was Sylvan's invitation to come Down Under in 1974 that brought it back to life. And now logic and philosophy have suffered a great, great loss. Greater than they know." (p. 340)

8. Paolini Paoletti, Michele. 2013. "Commentary: Exploring Meinong's Jungle and Beyond: an Investigation of Noneism and the Theory of Items by R. Routley." *Humana.Mente Journal of Philosophical Studies* no. 25:275-292.

   "I cannot give here an exhaustive account of Routley's whole investigation of noneism (i.e., the theory according to which, roughly, there are items that do not exist, or, in other words, that not all the items exist). Considering the structure of the book, it is possible to individuate: a brief presentation and defense of noneist theses (pp. 1–73); a critique of classical logic and the introduction of a revised, neutral (i.e., not existentially committed) logic grounded on the theory of items (this long part includes, among other things, some important remarks on the Characterisation Postulate, on identity, existence, possible worlds, inconsistency, definite descriptions, intensional contexts) (pp. 73–360); a defense of a Meinongian and presentist metaphysical theory of time (pp. 361–409); some replies to Quine's article *On what there is* (in the short paper *On what there isn't*) and to other objections (pp. 411–488); the contiguity between noneism and common sense (pp. 519–536); noneist theories of fiction (pp. 537–606), of existence (pp. 697–768), of mathematical and theoretical knowledge (pp. 769–832) and of other topics (e.g., universals and perception) (pp. 607–696); Routley's interpretation of Meinong's work (pp. 489–518) and the differences between Routley's noneism and other theories of items (pp. 833–890); the paper Ultralogic as universal in the Appendix (pp. 892–959).

   In this brief commentary, I shall focus on Routley's denial of the Ontological Assumption and on some theses, such as the Characterisation Postulate and the distinction between characterising and non-characterising properties. Furthermore, I shall present and discuss Routley's Meinongian Presentism and his theory of fictional items." (pp. 275-276)

9. Parsons, Terence. 1983. "Review of Exploring Meinong's Jungle and Beyond. by Richard Routley." *The Journal of Philosophy* no. 80:173-179.

"This book is an anthology of interconnected papers by the author. Some have been previously published, but some, including the title essay (Chapter 1, 259 pages), have not previously appeared in print. The theme of the book is a development and defense of a Meinongian theory of objects (called "items" by Routley), coupled with attacks on the "empiricist, reductionist, anti-Meinongian" world view that is now a prevalent theme in Anglo-American phil- osophy. Routley's views are in many ways closer to Meinong's than are those of any other current writer, and this alone would make the work of interest. The book is highly programmatic; in this review I will not try to forecast the ultimate fate of the program, but instead will try to indicate what I take to be its major themes." (pp. 173-174)

(...)

"This book touches on scores of topics that have not been mentioned here, including the definition of existence, existing at a time, relations, fictional objects, common-sense philosophy, second- order logic, mathematics, and scientific theories, plus an appendix on what the author calls "ultralogic," which is a logic that applies correctly in all situations, even impossible ones. The discussion is often provocative and almost always highly programmatic. Routley has explored portions of Meinong's jungle, and this edition is a fascinating diary of his journey. We still await a detailed map of the terrain." (p. 179)

10. Priest, Graham. 1997. "Sylvan's Box: A Short Story and Ten Morals." *Notre Dame Journal of Formal Logic* no. 38:573-582.

    Abstract: "The paper contains a short story which is inconsistent, essentially so, but perfectly intelligible. The existence of such a story is used to establish various views about truth in fiction and impossible worlds-"

    "Fictions are certainly not the only context in which impossible worlds—in whatever sense one takes to be correct—arise. Such worlds are also required to evaluate the truth of counterlogical conditionals.

    (...)

Another possible place in which impossible worlds may turn up is in an analysis of belief. Suppose that you were naıve enough to have believed my story, as a child might have done. You would then have believed that Sylvan had possessed a box that was both empty and nonempty, but you would not have believed that he had a cow that both did and did not lay eggs. If we parse ‘x believes that s’ as a relation between a

believer and a proposition, we may then take a proposition, in very orthodox fashion, to be the set of worlds/situations in which s is true. This gives the required result.

(Despite this, I doubt that impossible worlds are of much use in an analysis of belief; actual belief seems to have no determinate logical structure at all.)

The final point is less of a moral, more of an observation.

(10) An impossible world, as characterized above, is one where a logical truth is false, that is, its negation is true. There is nothing in this definition that precludes the actual world from being logically impossible. (All the logical truths may still hold there.) And once one agrees that there are impossible worlds, the question obviously arises as to how one can be so sure that the actual world is not one of them. There are, it seems to me, no good a priori reasons to suppose that it is not." (p. 581)

11. ———. 2003. "Meinongianism and the Philosophy of Mathematics." *Philosophia Mathematica* no. 11:3-15.

"Part of the beauty of meinongianism—or at least of Richard's approach to it, spelled out at length in *Exploring Meinong's Jungle* [1980]—is its technical simplicity. To do the idea full justice you need to have inconsistent and incomplete worlds, but these you have anyway, at least if you subscribe to some version of relevant logic. But the main technical trick is just thinking of one's quantifiers as existentially neutral. '∀ is understood as 'for every'; '∃' is understood as 'for some'. Existential commitment, when required, has to be provided explicitly, by way of an existence predicate, *E* , which, pace the way that Kant is often—and erroneously—interpreted, is a perfectly normal predicate. Thus, 'there exists something such

that' is '3x(*E* x ∧ ... *x* ..)'; and 'all existing things are such that' is '∀x(*E* x → ...x ...)'. The action of the theory is mainly, therefore, not at the technical level, but at the philosophical level." (p. 4)

12. Rapaport, William J. 1984. "Critical Notice of *Exploring Meinong's Jungle and Beyond* , by Richard Routley." *Philosophy and Phenomenological Research* no. 44:539-552.

"*Exploring Meinong's Jungle and Beyond* is a lengthy work (over 1000 pages) of wide scope, its cast of characters ranging from Abelard to Zeno. The nominal star is Meinong, of course, yet the real hero is Reid.(2) Topically, Richard Routley presents us with a virtual encyclopedia of contemporary philosophy, containing original philosophical and logical analyses, as well as a valuable historical critique of Meinong's work." (p. 539)

(...)

"If Meinong and Reid are the heroes of this work, then the "Reference Theory" (RT) - the theory that "truth and meaning are functions just of reference" (i) - is the villain. Routley sees his task as offering a different paradigm, noneism, which "aims at . . . a very general theory of all items whatsoever.(5). Where RT and its classical logic fail to provide solutions to problems of non-existence, intensionality, deducibility, significance, and context (ii), the noneist Theory of Items will - it is claimed - not only solve all of these, but also enable philosophers to treat adequately for the first time problems from the history of philosophy (including Reid's philosophy, Epicureanism, nihilism, sophism, fatalism, the Third Man), the philosophy of religion, the logic of perception, quantified tense logic, the problem of universals, and more (8-11). Noneism is Routley's patent medicine for all philosophical ills." (p. 540)

(...)

"Conclusion

There is much to admire in Routley's compilation, as well as much to ponder, to question, and to criticize. The book would have been better had it been more coherent (in all sense of that

word), but the effort required to plow through it is often rewarded." (p. 551)

(2) Cf., e.g., chap. 6, "The Theory of Objects as Commonsense," especially pp. 529 ff., and chap. 12, sec. i.

(3) See, *inter alia,* chap. 5, "Three Meinongs."

13. Seldin, Jonathan P. 1987. "A Relevant Validity in Curry's Foundations: A Reply to Richard Sylvan." *Bulletin of the Section of Logic* no. 16:68-70.

"Thus, in terms of Curry's definitions, the positive paradox principle is valid in terms of the metatheory of elementary formal systems (which is what Curry is talking about on p. 173 of [1]). Curry's claim about the

positive paradox principle is thus that it is valid in a particular context in the formal metatheory of elementary formal systems (as he has defined it).

As the last paragraph on p. 173 of [1] shows, he is not claiming that it is true generally." (p. 70)

14. Slater, B.H. 1992. "Routley's Formulation of Transparency." *History and Philosophy of Logic* no. 13:215-224.

Abstract: "Routley's Formula says, for instance, that if it is believed there is a man then there is something which is believed to be a man. In this paper I defend the formula: first directly, hut then by looking at work by Gensler and Hintikka against it, and at the original work of Routley, Meyer and Goddard for it. The argument ultimately reduces to a central point about the extensionality of objects in Routley, Meyer and

Goddard's intensional system, i.e. in its formulation of transparency."

"In 'Routley's Formula'

$O(Ex)Mx \supset (Ex)OMx$

'O' is an intensional operator on (Ex)Mx, such as 'it is believed that', and 'M' is an ordinary predicate, such as 'is a man'. So the formula says that if it is necessary, permitted . . . known, or supposed that there is a man, it follows that for something it is necessary . . . or supposed that it is a man. Now the formula has ground against many philosophers' intuitions. Indeed, it is invalid in all the standard systems of modal and general intensional logic, except the epsilon calcu!us system of Routley, Meyer and Goddard (Routley, Meyer and Goddard 1974 (hereafter referred to as Routley et alii), Routley 1977). On one view of 'intensional' objects they are world-bound or mentally private objects. On that view, other minds and worlds are like other places and times. So what is there may bear little relation to what is here.

And yet, as we shall see, the formula is true. For, on another view of the matter, if anything is on one's mind, it is a public object, and anything in another world is bound to be in this. Certainly it need not be conceived as it is publicly, or actually, but it is definitely the same object. Indeed the behaviour of 'it', in that last sentence, substantiates the very point which is made in it.

But many systems of logic do not capture the behaviour of such pronouns. And so doubts about Routley's Formula quite often arise. In the full defence of the formula, therefore, it becomes especially important to consider it both formally and informally. Exactly which aspects of Routley et al's system allow the formula to be validated, when all the others invalidate it? And does its very exceptionality, and the range of intuitions against it, not reduce its plausibility entirely?

I shall conciude, in the end, that Routley's Formii!a survives the current arguments against it, and can be given an increased rationale from that provided when it was first defended." (p.215)

(...)

16. von Solodkoff, Tatjana, and Woodward, Richard. 2013. "Noneism, Ontology, and Fundamentality." *Philosophy and Phenomenological Research* no. 87:558-583.

Abstract: "In the recent literature on all things metaontological, discussion of a notorious Meinongian doctrine—the thesis that some objects have no kind of being at all—has been conspicuous by its absence. And this is despite the fact that this thesis is the central element of the noneist metaphysics of Richard Routley (1980) and Graham Priest (2005). In this paper, we therefore examine the metaontological foundations of noneism, with a view to seeing exactly how the noneist's approach to ontological inquiry differs from the orthodox Quinean one. We proceed by arguing that the core anti-Quinean element in noneism has routinely been misidentified: rather than concerning Quine's thesis that to be is to be the value of a variable, the real difference is that the noneist rejects what we identify as Quine's "translate-and-deflate" methodology. In rejecting this aspect of Quinean orthodoxy, the noneist is in good company: many of those who think that

questions of fundamentality should be the proper focus of ontological inquiry can be read as rejecting it too. Accordingly, we then examine the differences between the noneist's conception of ontology and that offered by the fundamentalist. We argue that these two anti-Quinean approaches differ in terms of their respective conceptions of the theoretical role associated with the notion of being. And the contrast that emerges between them is, in the end, an explanatory one."

17. Witherall, Arthur. 2000. "Lewis and Sylvan on Noneism." *Grazer Philosophische Studien* no. 58-59:181-202.

"Several years ago David Lewis wrote a paper titled "Noneism or Allism?"(1) in which he attacked the idea that Richard Sylvan's (alias Richard Routley) rehabilitation of Meinong's theory of objects was truly what it was supposed to be. Lewis argued that Sylvan was not really a noneist, and that he should be interpreted as claiming that all of the objects that philosophers consider controversial actually exist (rather than none of them, as the name "noneism" implies). This is a drastic re-interpretation of Sylvan's work, and if it were true it would mean that he did not successfully rehabilitate the theory of objects at all.

(...)

Unfortunately, Richard Sylvan died in 1996, without having constructed a reply to Lewis. Although it is therefore difficult to say what kind of a reply he would have made, I believe that I can offer some significant criticisms of my own. I do not claim to represent Sylvan as such, but I claim to be sympathetic to his project, and in this respect I can do something towards refuting Lewis' claims. This is an important defensive task to perform for a Meinongian, because although Lewis' argument does not

assail the details of Sylvan's philosophy, it threatens to restore the old orthodox view of Meinongian metaphysics as 'committed' to an unreasonably bloated ontology, and thus to re-instate a serious misinterpretation of the whole enterprise. In assessing Lewis' paper, it must be kept in mind that *he does not address any of Sylvan's arguments* . He is only concerned with whether Sylvan should be seen as a true noneist or as an allist, with respect to the question of which controversial items exist. Nevertheless, in neglecting Sylvan's arguments, Lewis is deflecting

attention away from the substance of his position, and casting him as the defender of something unintelligible. I will show why this attack ultimately fails." (pp. 181-182)

Theory and History of Ontology

Raul Corazzon || e-mail: rc@ontology

George Englebretsen's Contribution to the Rediscovery of Traditional Formal Logic

Introduction

"In two important senses, Englebretsen is not the inventor of the logic of which he writes, though he no doubt deserves the title of the most dedicated and meticulous expositor of it today. In the first place the logic in question is none other than the so-called 'term logic' usually said to have been invented by Aristotle, taught throughout the middle ages, toyed with by Leibniz, forgotten in the enlightenment and surpassed at last by the great developments in mathematical logic associated with names like Boole, Frege, Russell, Quine. So at least runs the textbook history that the average student of logic would learn today. Term logic figures in the contemporary mind as one of the discarded fashions of science, much like the Ptolemaic system in astronomy. Englebretsen does not claim to invent but only to rehabilitate this logic. And such an effort obviously requires a reassessment of its history, of which the present work provides an outline.

But the logic is not Englebretsen's own in a second way. The book is a sustained and systematic exposition of the life work of Prof. Sommers of Brandeis University, whose efforts have revealed the continuity of term logic from Aristotle to Leibniz and also its character an uncompleted project, with unlimited promise in its application to logic of natural language. Sommers' work comes at a crucial moment, just as the problems in applying formal mathematical structures to ordinary language are coming to be

recognized. Sommers' unconventional approach, however, has seemed to many to be moving quickly in the wrong direction, toward the 'errors' of the past and he has thus acquired a reputation as the Ishmael of modern logic.

Professor Englebretsen's work is a systematic exposition and defense of Sommers' far-reaching contributions to logic, placing them in the context of a rectified history of the subject. Term logic is a project abandoned prematurely by logicians deceived by the appearance of security which the prestige of mathematics conferred upon mathematical logic. Recent logicians concluded too quickly that term logic was unformalizable, inadequate to reflect many of the actual inference structures of ordinary language, etc. The work of Sommers has demonstrated these claims to be false in the most appropriate way possible, by constructing a term logic of which they do not hold. Moreover Englebretsen has shown that Sommers' reply on behalf of term logic is not a mere riposte; it is a 'programme' of logic in the fullest sense. It contains a rigorously presented theory not just of the syntax, semantics and rules of inference for a term logic, but also a modal logic, a theory of predication, identity, singular terms, categories and ontology. In the reading of this book it is impossible not to get the idea that here is a vital programme for logic which is deserving of careful consideration and which is bound to lead to a re-evaluation of the traditional dogmas of mathematical logic." (pp. I-II)

For the bibliography of Fred Sommers see the page dedicated to him.

1. Englebretsen, George. 1969. "Knowledge, Negation and Incompatibility." *Journal of Philosophy* no. 66:581-585.

   "When epistemologists attempt to establish a distinction between knowledge and belief, very often what they want is a distinction between knowledge and mere belief.

They are interested in the sense of belief that is incompatible with knowing: a sense in which if something is believed it is not known, and if known not believed. This sense of belief (mere belief) is obviously different from the usual notion of belief.

In what follows I want to make a start at analyzing the concept of knowing by outlining the relations between knowledge statements (e.g., x knows that y) and other closely related statements." (p. 581)

2. ———. 1971. "Sommers' Theory and the Paradox of Confirmation." *Philosophy of Science* no. 38:438-441.

"In order to confirm any statement of the form (a) A are B we consider a sufficiently large number of A in order to check them for having or failing to have property B.

But logic leads us to believe that A are B is equivalent to (b) non-B are non-A. If this is so then it seems reasonable to suppose that we confirm (a) and (b) in the same way. Whatever set of things we consider for confirming one must be the same set that we consider for the other. Yet in confirming (a) the set considered seems to be the set of A, while in confirming (b) the set considered seems to be the set of non-B. How can two logically equivalent statements be confirmable in different ways?

I think this paradox is only apparent. It results from a simple confusion concerning the set of things considered for the confirmation of a statement." (p. 438)

3. ———. 1971. "On the Nature of Sommers' Rule." *Mind* no. 80:608-611.

"The number of recent journal articles (1) concerning Fred Sommers' "rule for enforcing ambiguity "(2) gives witness to an increasing interest in Sommers' way of doing ontology. Some of these articles can be said to display, at best, an undisguised misunderstanding of

just what the rule says. Others show, at worst, an - unwillingness to say what the intent and nature of the rule is. In this paper I want to say clearly just what the nature of the rule

for enforcing ambiguity is and show what Sommers intends by its formulation and use.

In " Types and Ontology "(3) Sommers has established an isomorphism between the structure of ordinary language and the ontological structure. The structure of a language can be represented on a "language tree ". A language tree is a mapping of the " sense" relations which hold between the terms of the language. Two terms, P and Q, have the sense relation U (written " U(PQ) ") just in case they can " make sense " together in a subject predicate sentence. If they do not make sense together, then any subject-predicate sentence formed with them will be a category mistake. A language tree can be formed by writing all the terms of the language so that a solid line is drawn only between U-related terms.(4)" (p. 608)

4. ———. 1971. "Elgood on Sommers' Rules of Sense." *Philosophical Quarterly* no. 21:71-73.

" Several discussions of Fred Sommers's rules of sense have appeared recently. I will examine here the one by A. G. Elgood (this journal, April 1970) because I believe it clearly exemplifies how Sommers's theory is being too often misinterpreted by his critics.' My two points of criticism against Elgood will be brief. First, his formulations for the criterion of type differ- ence are ill-formed. Second, his counter examples fail because they

ignore a subtle, but crucial, distinction which can, be extracted from Sommers's theory. " (p. 71)

   R. J. [Robin J. Haack] and Susan Haack have argued recently that " true " and " false " are, while univocally predicable of both sentences (tokens) and propositions, primarily predicated of sentences.(1) I do not wish to take issue here with the thesis that sentences rather than propositions

   are the primary bearers of truth. What I do want to reject is the view that " true " and " false " can univocally be applied to both sentences and propositions." (p. 451)

7. ———. 1972. "Persons and Predicates." *Philosophical Studies* no. 23:393-399.

   "My main thesis in this short paper is that the attribute theory of persons is correct but often misunderstood by its critics. We might best begin by comparing our theory with other possible theories of persons. Let us consider three other general sorts of theories: materialism, idealism, and dualism.

   According to any materialist theory of persons, a person is nothing more than a material object. Talk about mental (i.e. nonmaterial activities) can be translated into talk about bodily (material) activities. Thus, for the behaviourist, the difference between a person and any other material object lies in the differences between the bodily activities of the two. To say that persons differ from stones in that they (persons) are intelligent is simply to say, on this view, that material objects which are

persons often, in certain circumstances, act in ways in which material objects which are stones do not act. This is the view of behaviourists who are materialists. A behaviourist need not be a materialist.

Nor need a materialist be a behaviourist. A materialist might be an 'identity-theorist'. He would hold, then, that a person is nothing more than a material object. But, he distinguishes between persons and other material objects in a way other than that used by the behaviourist materialist.

The identity-theorist argues that a person differs from other material objects in that a person has a mind while other material objects do not. He then goes on to guarantee his materialism by identifying a person's mind with his brain or central nervous system.

For the idealist, a person is simply a mind (or soul or spirit), and minds are immaterial. Here persons differ from material objects simply by not being material. How idealists distinguish persons from other immaterial objects is not always dear. One thing is clear: the idealist who fails to distinguish between immaterial objects which are persons from immaterial objects which are not persons runs the risk of conceiving of persons in terms of those other immaterial objects (e.g. ideas of impressions or sense data) and thus, like Hume, ending up without a concept of persons." (pp. 393-394)

8. ———. 1972. "Vacuosity." *Mind* no. 81:273-275.

   "It is argued here that F. Sommers' notion of vacuousity must be expanded to allow for statements presupposing false statements which may not be existential. the result of this is the enforcement of a distinction between vacuousity and category mistakenness, and, more importantly, a distinction between the spanning and predicability relations which hold between terms and things."

9. ———. 1972. "Sommers on Empty Domains and Existence." *Notre Dame Journal of Formal Logic* no. 13:350-358.

10. ———. 1972. "On van Straaten's Modification of Sommers' Rule." *Philosophical Studies* no. 23:216-219.

"I argue here that R. van Straaten's four modifications of F. Sommers' 'rule for enforcing ambiguity' are based upon a misunderstanding of the basis of the rule and a failure to see the spanning/predicability distinction. The effect is that none of van Straaten's several counterexamples are telling against the rule. In place of van Straaten's modifications I offer the following simple but important changes in the rule: the restriction of things to individuals and the reading of 'makes sense to predicate' and similar phrases in terms of the spanning relation."

11. ———. 1972. "A Revised Category Mistake Argument." *Philosophical Studies* no. 23:421-423.

14. ———. 1973. "Meinong on Existence." *Man and World* no. 6:80-82.

    "For several years I was told, and believed, that while Russell's theory of descriptions might he flawed (viz. in the way Strawson showed), his rejection of Meinong's theory of objects, which led to the theory of descriptions, was undoubtedly correct. Now I doubt very much if this is so.

    The "official" view is that Meinong had made the mistake of multiplying the senses of "exists" unnecessarily. According to this view, Meinong, since he held that the descriptive components of any meaningful sentence must refer to something, was forced to provide a special kind of existence, subsistence, for entities which are nonexistent but referred to meaningfully. Russell avoided this position by claiming that statements referring to nonexistent entities are meaningful but false (since they logically entail the existence of the entity referred to). I think the official view underestimates Meinong's philosophical abilities. Indeed, I think, rather than engaging in the philosophically dangerous task of multiplying kinds of

existence, Meinong was expressing a keen insight into the nature of existential commitment." (p. 80)

15. ———. 1973. "Presupposition, Truth and Existence." *Philosophical Papers* no. 2:39-40.

    "Ever since Strawson first introduced the notion of presupposition into logical matters, debate has continued over the nature of this operation.

    Is presupposition a logical relation between statements? Formal logic or "informal" logic? Does it mean that there are truth-value gaps? Isn't it just material implication?

    According to Strawson, a statement which presupposes a true statement is either true or false but a statement which presupposes a false statement is neither true nor false. These latter kinds of statements are vacuous. Compare this notion of presupposition with that of material implication. A statement which materially implies a true statement is either true or false while a statement which materially implies a false statement is false. What is the relation between 'The present King of France is bald' and 'The present King of France exists'? Strawson says it is one of presupposition. Russell said it was material implication. The Russellian rejects the notions of presupposition and vacuousity in order to preserve crucial elements of formal logic (viz. truth-functionality and bivalence). The Strawsonian accepts the concepts of presupposition and vacuousity as reflective of important elements in ordinary discourse, and thus denies those parts of formal logic which his opponent treasures." 17. ———. 1973. "Locke's Language of Proper Names." *Locke Newsletter* no. 4:25-30.

    "It is argued here that recent discussions concerning the compatibility of Locke's theory of nominal essences with Geach's thesis (that each use of a proper name must presuppose the ability to use some corresponding general term) fail to appreciate the important difference between the

generation of Lockean general ideas (from ideas of individuals) and the generation of Lockean general terms (not from proper names)."

18. ———. 1973. "Epistemic Logic and Mere Belief." *Logique et Analyse* no. 63-64:374-378.

    "In a previous article (1) I argued that the distinction which epistemologists look for between knowing and believing is actually the distinction between knowing and merely believing, where, unlike belief, mere belief is incompatible with knowledge.

    Using Fred Sommers' notion of predicate negation, (2) where the negation of a predicate is equivalent to the disjunction of all those predicates incompatible with it , I formulated several epistemic statements and drew out ten conditionals which should at least be theorems of any epistemic calculus.

    In what follows I want to set up the axioms for an epistemic calculus. A few of these wi l come from my previous list of conditionals. I then want to show that in such a system the necessary conditions for mere belief can be adequately formulated." (p. 375)

19. ———. 1973. "Suggested Truth-Tables for a Three-Valued Sentential Logic." *International Logic Review* no. 8:255-259.

    "Truth-tables for the normal sentential connectives are constructed on the basis of the concept of 'partial values'. On this view, every statement has a truth-value which is a function of an ordered pair of partial values. The first member is either T or non-T and the second is either F or non-F. The four combinations of partial values result in three possible truth-values: true, false, and empty."

20. ———. 1974. "Sommers on the Predicate 'Exists'." *Philosophical Studies* no. 26:419-423.

    "In a series of recent journal articles F. Sommers has developed a logic of terms which differs greatly from the usual logic now taught in the schools. However, Sommers has commited himself to a thesis proper to that logic but not to his: everything exists. It is shown here that such a thesis cannot follow from Sommers' previous work. Using his logic proofs that something exists and that something does not exist are given."

21. ———. 1974. "A Note on Contrariety." *Notre Dame Journal of Formal Logic* no. 15:613-614.

    "It is shown here that S. McCall's proposal, that in addition to the normal sentential operation of negation there is another, more traditional, sentential operation of contrariety ("Contrariety," Notre Dame Journal of Formal Logic, 8, 1967) is misguided. There is indeed a contrariety operator. But, it is a predicate operator rather than a sentential operator. The ability to explicate contrariety is just one of the advantages which an Aristotelian logic of terms has over modern sentential logic."

24. ———. 1974. "Behaviorism and Perception." *Man and World* no. 7:149-157.

    "After distinguishing the ontological question concerning persons (what is the concept of a person?) from the epistemological question (on what grounds does my knowledge of persons rest?) three kinds of behaviorism are cited as responses to the Cartesian answer to the epistemological question. Unlike physicalism and dispositionism, restricted behaviorism denies that knowledge applies at all to myself and goes on to distinguish behavior from bodily activity. On this theory behavior is taken to be interpreted bodily activity -- bodily activity seen as personal behavior."

27. ———. 1975. *Speaking of Persons*. Halifax: Dalhousie University Press.

    "This monograph is an attempt to defend an attributist theory of the concept of a person. It is held that our ordinary concept of a person is the concept of a noncomposite (contra dualism), material (contra idealism) object, to which both Strawsonian p- and m-predicates apply. Personal identity is accounted for in terms of bodily continuity "and" sortal continuity. Finally, with the aid of F. Sommers' theory of linguistic-ontological ismorphism, it is argued that an ontological theory compatible with our theory, must reject any sort of spirit, including God."

28. ———. 1975. "Sommers' Proof That Something Exists." *Notre Dame Journal of Formal Logic* no. 16:298-300.

    "In the concluding remarks of [4] I mentioned that in [8] Sommers had given a proof to the effect that necessarily something exists and that later in [5] this proof was shown to be wrong in principle. Sommers' proof went like this:

    1. Something is possible.

    2. Whatever is not a categorially possible thing is not a possible thing.

    3. Suppose there were nothing (i.e., nothing exists).

    4. By definition D-things are categorially impossible if and only if nothing

    is D and nothing is D.

    5. For any D, nothing is D and nothing is D. (by 3)

    6. For any D, D-things are categorially impossible, (by 4 and 5)

    7. For any D, D-things are not possible things, (by 2 and 6)

Since 7 is inconsistent with 1, we must reject 1 or 2 or 3 or 4. 1, 2, and 4 seem certain. Thus we must reject 3. This gives us the negation of 3 (Something exists).

Q.E.D.

Guerry attacked Sommers' proof by showing that 4 allows counterexamples and must be rejected rather than 3. What bothered Guerry about 4 was that it allowed Sommers to "derive a necessity (the impossibility of D-things) from a contingency (the nonexistence of D- and D-things)."

Nevertheless, a simple reformulation of this definition (4) can be used to render the proof immune to Guerry's attack. The reformulation is simply what I think Sommers had actually intended by 4. However, this reformulated argument can be shown to be simply invalid requiring Sommers to find a completely new argument for his purposes." (p. 298)

    "Aristotle's thesis that universals must always inhere in a primary substance, a particular, has been used recently as evidence that he, like many contemporary logicians, rejected the predication of terms to universal, i.e., nonsingular, subjects. Yet this would force Aristotle to treat quantifiers as ranging over bare, unsorted, particulars. But Aristotle took the notion of an unsorted particular as nonsense. His thesis about the status of universals can no more serve as evidence that he took all subjects as particulars than can his thesis that every particular satisfies some universal serve as evidence that he took no subjects as particular."

36. ———. 1980. "Singular Terms and the Syllogistic." *The New Scholasticism* no. 54:68-74.

    "It is generally held that singular terms have no place in Aristotle's syllogistic. A variety of reasons have been given for holding this view. Nevertheless, Aristotle did offer examples of syllogisms containing singular terms. It is suggested here that the reasons for denying singulars a place in syllogistic are

unacceptable. Thus, singular terms are on a logical par with general terms.

They can be subject terms (thus be quantified) and they can be predicate terms as well (thus be affirmed or denied of subjects). A proper understanding of how this is so comes only from a clear understanding of Aristotle's theory of logical syntax. Recently F. Sommers has provided a syllogistic logic ("the calculus of terms") which shows, among other things, how singulars can be treated syllogistically."

37. ———. 1980. "Noncategorical Syllogisms in the *Analytics*." *Notre Dame Journal of Formal Logic* no. 21:602-608.

"It is a commonplace now among logicians that the logic of categorical syllogisms, first developed by Aristotle, presupposes the now-familiar logic of unanalyzed propositions. Aristotle, however, clearly took the syllogistic to be "basic logic", presupposing no other logic. Since he was not unaware of many important principles now constitutive of the calculus of propositions, it can only be argued that either: (i) Aristotle was blind to the import of such principles for formal logic in general, or (ii) he believed such principles could be accounted for by the syllogistic. In spite of the numerous and illustrious supporters of (i), we shall attempt here a brief defense of (ii).

The question, of course, is not whether Aristotle himself substantiated (ii), but rather: can any syllogistic substantiate (ii)? In answering this question affirmatively we will first cite several arguments which are found in the *Analytics*, and which make use of well-known principles of the propositional calculus. We shall then make some historical remarks concerning the attempt to reduce the logic of unanalyzed propositions to the logic of analyzed propositions (the syllogistic). Finally, we hope to show how a recently developed syllogistic system offers a technique which can be used to successfully render the arguments cited from the *Analytics* as categorical syllogisms." 41. ———. 1980. "Chandler on Change." *Critica* no. 7:81-85.

    "Common sense, as Aristotle saw, demands an account of the world which admits both accidental and substantial change. In the first an object ceases to be how-it-is; in the second it ceases to be what-it-is. H. S. Chandler's recent critique of M. Loux's "Substance and attribute" suffers from a misunderstanding of this distinction. Chandler mistakenly concludes from the Aristotle-Loux theory that because an object is necessarily what-it-is, then it is eternally what-it-is."

43. ———. 1981. "A Journey to Eden: Geach on Aristotle." *Grazer Philosophische Studien* no. 14:133-141.

    "Peter Geach has charged Aristotle with the sin of corrupting logic by initiating a process which led to the view that a sentence consists logically of just two names. This charge can only result from a clearly mistaken view of Aristotle's theory of logical syntax. Aristotle, unlike Geach, was careful to distinguish subjects from subject-terms and predicates from predicate-terms.

    He took both subjects and predicates as syntactical complexes. Geach, following Frege, holds a very different theory of logical syntax which takes predicates, but not subjects, as syntactically complex."

44. ———. 1981. *Logical Negation*. Assen: Van Gorcum.

    Introduction 1; Some historical remarks 3; Negation in mathematical logic 19; Sommers' term logic 28; The symbolism

for a term logic 38; Negation and falsity 47; Concluding remarks on the nature of formal logic 56; Index 61-62.

"This monograph examines the notions of negation found in classical, Stoic, and contemporary mathematical logics and argues that for philosophical purposes, and consonant with ordinary discourse, the notions of predicate denial and term negation (Aristotle's) are to be preferred over the sentential negation now favored. Arguments supporting this atavism are drawn from or based upon the work of F. Sommers. A final result of this investigation is new light on falsity."

45. ———. 1981. *Three Logicians: Aristotle, Leibniz, and Sommers, and the Syllogistic*. Assen: Van Gorcum.

Preface VII; Introduction 1; *Three logicians*; Aristotle 9; Leibniz 28; Sommers 42; *The syllogistic*; Contemporary mathematical logic 67; Syllogistic logic 77; Concluding remarks 109; Bibliography 113; Index 116-118.

"In his *Introduction to Logical Theory* (London, 1952) P.F. Strawson attempted to show that traditional syllogistic logic was more reflective of various features of ordinary language than was modern mathematical logic. P. Geach, the best modern critic of traditional logic, responded to Strawson in "Mr. Strawson on Symbolic and Traditional Logic", *Mind,* 72 (1963). His brief remarks there show that Strawson's defense of the old logic is, at best, naive. Geach clearly believes that there just can be no sound defense of traditional logic. He even suggests that those who would persist in their allegiance to the old logic are either irrational or lazy. He says:

Many readers will vaguely think Strawson has *proved* that the traditional system with all its faults is philosophically less misleading than the new-fangled one. Those Colleges of Unreason where the pseudo-Aristotelian logic is presented as the only genuine logic, and those lecturers who would like to teach the philosophy of logic without having to learn any modern logic, may well thus have been supplied with a pretext for supine ignorance.

We believe that syllogistic logic is philosophically defensible. What Geach sees as its faults are either not faults at all or can be remedied. The result of applying such remedies is a new syllogistic - a logic which is broader and stronger than Aristotle's original. It is a logic competitive with the "new fangled" logic of today. This new syllogistic was invisaged, but not built, by Leibniz. The hope for such a logic lay dormant during the period when mathematical logic was being born and nurtured through its rapid maturity. But recently that hope has been revitalized, and virtually fulfilled, in the work of F. Sommers. The best general answer to Geach's overall charge is simply a presentation of this new syllogistic.

While the primary motive in presenting this essay is the defense of syllogistic against its modern detractors, we also believe that it is time for a concise introduction to Sommers' logical work. This work is scattered throughout a wide variety of journals and anthologies; and there is now no available account of it. Given the great originality of Sommers' ideas, and the importance of the issues he has chosen to deal with in logic, this void must be filled. Part of this essay is intended as a modest start at that task." (From the Preface).

47. ———. 1981. "On the Terms of Truth." *Philosophical Papers* no. 10:89-92.

    "Correspondence theories of truth require a special relation between sentences and the world.

    Relying on suggestions first made by Leibniz, and later expanded by Sommers, it can be shown that the relation called for is simply that of denotation. Since denotation is primarily a relation between a term and things, sentences must be construed as terms. The things denoted by sentences are (pace Sommers) states of affairs."

48. ———. 1981. "Predicates, Predicables and Names." *Critica* no. 8:105-108.

"It is a canon of modern predicate logic that general terms are predicates and subjects are singular. Traditional logic, by contrast, took all terms to be fit for either the subject or predicate roles. The thesis, recently defended by T. Burge, that names are predicates amounts (once the prejudices of modern logic are abandoned) to the much weaker claim that names can be used as general terms."

49. ———. 1981. "A Note on Identity, Reference and Logical Form." *Critica* no. 8:75-81.

50. ———. 1982. "Do We Need Relative Identity?" *Notre Dame Journal of Formal Logic* no. 23:91-93.

51. ———. 1982. "Aristotle and Quine on the Basic Combination." *The New Scholasticism* no. 56:244-249.

    "Quine's 'basic combination' is a sentence joining a singular to a general term. The position as the singular is referential -- that of the general is predicational. Singulars and generals are unfit for each other's position. This contrasts with Aristotle's view, which takes such sentences to join a subject and a predicate. A subject is a quantified term -- a predicate is a qualified term. Yet the terms themselves are syntactically homogeneous -- fit for each other's position. One motive behind the Quinean view is the belief that: (i) subjects refer, (ii) singular refer to individuals, (iii) universals cannot be referred to. So, since generals cannot refer without referring to universals, generals are unfit for subjects. the Aristotelian account of logical syntax also avoids Platonic consequences, but not at the cost of an unsupported singular/general distinction."

76. ———. 1985. "Semantic Considerations for Sommers' Logic." *Philosophy Research Archives* no. 11:281-318.

    "During the last twenty-five years Fred Sommers has developed a series of inter-related theories of language structure,

ontological structure, logical syntax, and truth. Each theory has naturally contained valuable suggestions concerning semantic issues. But Sommers has not yet offered a specifically semantic theory. I attempt here to fill that gap by sketching a theory of semantics based upon his logical theses. The theory holds that terms, as used in statement making sentences, have both denotation and signification. Terms denote objects and signify properties. Terms, when quantified, refer to some or all of their denotations, and, when quantified, characterize the subjects to which they are predicated as having or lacking the properties they signify. The semantic, syntactic, and ontological theses presented in this theory are contrasted with those found in classical, Scholastic, Leibnizian, Fregean, and Quinean theories."

77. ———. 1986. "On Some Alleged Semantic Correlations." *The New Scholasticism* no. 60:490-500.

    "The Fregean replacement of the subject/predicate distinction with the argument/function distinction led to an emphasis on the singular/general distinction for logic. Only singulars could be subjects; only general terms could be predicates. Singulars refer; predicates are true of Ultimately the Fregean syntactic distinction is semantic. The old subject/predicate is not. A semantic theory based on the old logic of subjects and predicates can allow the semantic, syntactic and ontological distinctions their proper places."

78. ———. 1986. "Singular / General." *Notre Dame Journal of Formal Logic* no. 27:104-107.

    "Modern logic takes the difference between singular and general terms very seriously. It insists that sentences with general subjects have a much more complex logical syntax than sentences with singular subjects.

    This is partly because modern logic always treats general terms as predicates and never treats singular terms as anything but subjects. The insistence that the logic of singulars is different from the logic of general propositions is also partly due to modern logic's demand that the logical form of any sentence be a reflection of its truth conditions. 'Socrates is wise' is true just

in case Socrates is wise. But 'Some philosopher is wise' is true just in case there is at least one thing which is such that it is a philosopher and it is wise. So the modern logician requires a great deal of semantic information to be reflected in syntax. But how does a logician decide how much semantic information should be so reflected? Surely not all. There's just too much. Just that which determines truth? 'John is a bachelor' has as one of its (necessary) truth conditions that John is a male. Yet the modern logician does not require this bit of semantic information to be revealed syntactically."

79. ———. 1986. "Czezowski on Wild Quantity." *Notre Dame Journal of Formal Logic* no. 27:62-65.

    "It is well known that if singular sentences are to be fully incorporated into a syllogistic logic, singular subjects must be quantified. Leibniz argued that such subjects are both universal and particular. Similar (but not identical) views have been advanced in this century by Copi, Sommers and Czezowski. but the latter has argued that singular quantity is unique, distinct from the two classical quantities. it is shown here that this is an illusion."

80. ———. 1986. "A Note on Truth and Existence in Leibniz." *Manuscrito.Revista Internacional de Filosofia* no. 9:7-9.

    "Leibniz was able to connect the notion of truth for a sentence with the idea of existence for individuals. Words and sentences are taken to both denote individuals and signify concepts. iI a true sentence two conditions must hold. The concept signified by the subject and the word denoted by the sentence must be the actual word."

83. ———. 1987. "Natural Syntax and Sommers' Theory of Logical Form." In *The New Syllogistic*, edited by Englebretsen, George, 245-272. New York: Peter Lang.

    "F. Sommers has challenged the Fregean theory of logical syntax. In particular, he has denied the idea that natural language has no logic. It is possible to articulate a theory of logical syntax for natural language. it construes sentences as concatenations of subjects and predicates. A subject is a quantifier plus a term; a predicate is a qualifier plus a term. Surprisingly, such an analysis accounts not only for categoricals but singulars, identities, rationals and truth-functions."

84. ———. 1987. "Logical Polarity." In *The New Syllogistic*, edited by Englebretsen, George, 305-311. New York: Peter Lang.

"Both statements and terms can be negated. They come in positively/negatively charged pairs. This polarity is reversible for terms (for any negative term a semantically equivalent positive can be defined) but not for statements. An account of why this is so is offered here."

90. ———. 1989. "Formatives." *Notre Dame Journal of Formal Logic* no. 30:382-389.

    Abstract: "An answer to the question of 'sentential unity' (What makes a sentence a single linguistic unit rather than just a string of words?) is one of the goals of any theory of logical syntax. A 'Fregean' theory claims that a sentence is a function (unsaturated expression, containing gaps) whose gaps are filled with either arguments (saturated, gap-less) or other functions which have already been saturated. A 'Leibnizian' theory construes a sentence as a syntactically complex subject

(quantified term) plus a syntactically complex predicate (qualified term). Subjects and predicates just naturally fit one another to form sentences. An 'Aristotelian' theory takes a sentence to consist of a pair of terms connected by a binary formative expression (functor), whose only role is to connect terms to form more complex expressions (e.g., sentences). After an examination of the formal nature of such functors, it is argued that this third sort of theory not only answers better the question of sentential unity, but it also provides a better account of the nature of logical constants in general."

93. ———. 1990. "Cartesian Syntax." *Philosophical Inquiry* no. 12:59-64.

    "The "Cartesian" theory of logical syntax was most fully formulated by the Port-Royal logicians. A brief survey of their work, especially the Logique, shows that they took a statement to have a deep structure analyzable as a predication. It is a joining or separating of two terms by a positive or negative copula. Complex terms were also viewed as (implicit) predication. The logical syntax of predication requires no

recourse to semantic distinctions among terms, nor does it distinguish atomic from molecular statements."

"In the late nineteenth century there were two very active lines of research in the field of formal logic. First, logicians (mostly in English-speaking countries) were engaged in formulating a generally traditional logic as an algebra, a part of mathematics; second, logicians (mostly on the Continent) were busy building a non-traditional logic that could serve, not as a part of, but as the foundation of, mathematics. By the end of the First World War the former line had been pretty well abandoned while the second continued to expand. However, that old abandoned line, stretching from Aristotle, through the Scholastics and then Leibniz to the nineteenth century algebraists, had not been

completely forgotten. One of those logicians who has recently worked on the restoration (and, importantly, the extension) of that line is Fred Sommers. His Term Logic preserves a number of traditional insights (especially involving the theory of logical syntax), while also enjoying a power to account for formal inference at least comparable to that of the standard logic now in place."

107. ———. 2004. "Predicate Logic, Predicates, and Terms." In *First-Order Logic Revisited*, edited by Hendricks, Vincent, Neuhaus, Fabian, Pedersen, Stig Andur, Scheffler, Uwe and Wansing, Heinrich, 75-88. Berlin: Logos Verlag.

    Abstract: "My primary aim here is to introduce in a very preliminary way a system of formal logic that has been built by Fred Sommers and myself over the past few years. This term logic matches the inferential power of the standard first-order predicate logic, but enjoys certain advantages in terms of simplicity and naturalness. What I hope this can offer is some insight into ideas concerning formal logic that are extremely old but not often encountered today. I may rightly be accused of atavism for touting such antiques, but perhaps the contrast between these ideas and more contemporary ones will be of interest. So, some of my remarks will concern some central logical concepts (especially the concept of predication), while others will be a bit historical."

108. ———. 2005. "Trees, Terms, and Truth: The Philosophy of Fred Sommers." In *The Old New Logic. Essays on the Philosophy of Fred Sommers*, edited by Oderberg, David S., 25-48. Cambridge: The MIT Press.

    "During the past fifty years Fred Sommers has developed bold and original ideas concerning the sense structure of natural language and how it reveals ontological structure, a powerful and fully expressive version of term logic, and a revitalized theory of truth by correspondence. This essay shows how all these ideas are mutually related to one another. Together they amount to a unified, coherent theory of mind, language and the world. Sommers's work in these areas has influenced research in philosophy of language, logic, and cognitive psychology."

109. ———. 2006. *Bare Facts and Naked Truths: A New Correspondence Theory of Truth*. Aldershot: Ashgate.

Contents: Preface IX. Part One: Introduction; 1. À la recherche du temps perdu 9; 2. The big MAC attack 37; Part Two: 3. Terminism 79; 4. Facing the facts 1070; 5. Giving the world Its due 141; 6. A nice derangement 153; Conclusion 167; Bibliography 171; Index 189.

"The aim of the present essay is to outline a theory about truth. Since a number of concepts are involved in the concept of truth this means that I shall has to offer clarification, of one sort or another, of a large number of concepts and conceptual clusters. Some of these involve what there is, existence, reality, and the like (so my project is partly metaphysical); some involve knowledge, belief, perception, and so forth (so my project is partly epistemological); others involve sentences, terms, propositions, statements, saying, and so on (so part of my project is in the philosophy of language -- semantics). To illustrate briefly what I've been saying, consider some of the semantic concepts with which we shall be dealing. The terms of art needed to talk about such things as sentences, statements, facts, stating, saying, and what is stated are all plagued by ambiguity (and much else besides). To disambiguate them, trace out their different senses, is to analyze the multiple concepts they can express. Thus a sentence might be either a sentence-type or a sentence-token; a statement might be either a sentence or what is expressed by a sentence; a fact might be either a true sentence, a true statement, a truth expressed by a sentence (or by a statement), or what makes something (a sentence, statement, and so on) true; to state might be to utter, to express, to signify, or to do something else; to say might be to utter or to state; what is stated might be a sentence, a fact, or something else. So here we have just a portion of a large cluster of concepts that is implicated in any account of truth and is in serious need of clarification, analysis, disentanglement -- and I have yet to focus on the concept of a concept. An appropriate way to make progress here is to try to formulate a detailed, specific theory of truth. Along the way, the clarification of various concepts will help push along the development of the

theory. Reciprocally, the theory, as it gets formulated, will help shed light on various key concepts and at least show the way to the clarification of others."

113. ———. 2012. *Robust Reality: An Essay in Formal Ontology*. Frankfurt: Ontos Verlag.

    "Because I owe so much to Fred Sommers, I offer the present book as a feeble attempt to fulfill his wish to provide a full account of the tree theory, of the structure of language, its relation to ontology, and the many fruits that can be harvested from it - especially when watered by logic and ripened in the sunlight of truth." (p. XIII).

    "In this essay, we have examined systems of formal ontology hinted at by Aristotle, attempted by Ryle, and one fully articulated by Sommers. Each took some formal aspect of language to provide a guide to the formal structure of the ontology. More particularly, each concentrated on semantic relations as key to that structure. This contrasts with more recent theories that take the syntactic forms dictated by modern mathematical logic as the proper guide to ontology. Sommers' semantic-ontological tree theory proved fruitful. For example, it highlighted the fact that term ambiguity, which requires different senses of a term to have different locations on the language tree, is most commonly the result of following rules - rules that "enforce ambiguity" on some terms. Moreover, the theory permitted a rational way to look at the order in which various rules governing language apply - "levels of rectitude".

Given the isomorphism of sense structures for the terms of ordinary language and the inclusion relations among categories of things, the notion of levels of rectitude could be extended to rules governing ontology as well. The key notion of spanning, which holds or fails to hold between a (sense of a) term and thing, helps enrich our understanding of how things can constitute not only sets but categories and types.

In examining the tree theory, with its focus on terms, one can't help noting that much depends on the idea that predication is essentially a relation between a predicable term and another term, which is also predicable. It was this idea, that statements could be parsed as pairs of terms standing in the relation of predication, that led Aristotle away from the view that statements consist of names and verbs. Giving up that grammar-based view freed Aristotle to view statements as consisting of pairs of terms joined together by a logical copula doing the work of predication. Only then was he able to develop formal logic, a term logic, the syllogistic." (pp. 143-144).

115. ———. 2016. "Fred Sommers' Contributions to Formal Logic." *History and Philosophy of Logic* no. 37:269-291.

Abstract: "Fred Sommers passed away in October of 2014 in his 92nd year. Having begun his teaching at Columbia University, he eventually became the Harry A. Wolfson Chair in Philosophy at Brandeis University, where he taught from 1963 to 1993. During his long and productive career, Sommers authored or co-authored over 50 books, articles, reviews, etc., presenting his ideas on numerous occasions throughout North America and Europe. His work was characterized by a commitment (often implicit) to the preservation and application of historical insights and to the value of a well-articulated, coherent logical system. He was recognized for his independence and refusal to accept any view on the basis of authority alone. This made him a formidable critic but accounted in part for his many innovative and original ideas. In spite of his general contrariness in logic, Sommers earned the respect of the

majority of his contemporaries, including Russell, Quine, van Benthem, Hacking, Suppes, and Strawson. In 2005, he was the subject of a *Festschrift* with contributions by a number of younger philosophers and logicians, just one indication of the continuing importance and influence of his work."

    "Post-Fregean mathematical logic began with a concern for foundational issues in mathematics. However, by the 1930s philosophers had not only contributed to the building and refinement of various formal systems, but they had also begun an exploitation of them for primarily philosophical ends. While many schools of philosophy today eschew any kind of technical, logical work, an ability to use (or at least a familiarity with) the tools provided by formal logic systems is still taken as essential by most of those who consider themselves analytic philosophers. Moreover, recent years have witnessed a growing interest in formal logic among philosophers who stand on friendly terms with computer theory, cognitive psychology,

game theory, linguistics, economics, law, and so on. At the same time, techniques developed in formal logic continue to shed light on both traditional and contemporary issues in epistemology, metaphysics, philosophy of mind, philosophy of science, philosophy of language, and so forth.

In what follows, students who have already learned something of classical mathematical logic are introduced to some other ways of doing formal logic: classical logic rests on the concepts of truth and falsity, whereas constructivists logic accounts for inference in terms of defense and refutation; classical logic usually makes use of a semantic theory based on models, whereas the alternative introduced here is based on the idea of truth sets; classical logic tends to interpret quantification objectually, whereas this alternative allows for a substitutional interpretation of quantifiers. As well, a radically different approach, fundamentally different from any version of mathematical logic, is also introduced. It is one that harkens back to the earliest stages in the history of formal logic but is equipped with the resources demanded of any formal logic today." (pp. 1-2)

120. Sommers, Fred, and Englebretsen, George. 2000. *An Invitation to Formal Reasoning. The Logic of Terms*. Aldershot: Ashgate.

Preface X; 1. Reasoning 1; 2. Picturing propositions 25; 3. The language of logic (I) 49; 4. The language of logic (II) 77; 5. Syllogistic 109; 6. Relational syllogistic 139; 7. Statement logic 163; 8. Modern predicate logic 213; Rules, laws and principles 253; A note on further reading 259-260.

The book "introduces the discipline of formal logic by means of a powerful new system formulated by Fred Sommers.

This system, term logic, is different in a number of ways from the standard system employed in modern logic; most striking is, its greater simplicity and naturalness. Based on a radically different theory of logical syntax than the one Frege used when initiating modern mathematical logic in the 19th Century, term logic borrows insights from Aristotle's syllogistic, Scholastic logicians, Leibniz, and the 19th century British algebraists.

Term logic takes its syntax directly from natural language, construing statements as combinations of pairs of terms, where complex terms are taken to have the same syntax as statements. Whereas standard logic requires extensive 'translation' from natural language to symbolic language, term logic requires only 'transcription' into the symbolic language. Its naturalness is the result of its ability to stay close to the forms of sentences usually found in every day discourse. Written by the founders of the term logic approach, An Invitation to Formal Reasoning is a unique introduction and exploration of this new system, offering numerous exercises and examples throughout the text. Summarising the standard system of mathematical logic to set term logic in context, and showing how the two systems compare, this book presents an alternative approach to standard modern logic for those studying formal logic, philosophy of language or computer theory."

Jerzy Perzanowski: Modal Logics, Ontology and Ontologics

Introduction

This page use the font *Lucida Sans Unicode* for logical symbols.

An overview of Perzanowski's thought can be found in the *Preface* by Janusz Sytnik-Czetwertynsk to the volume *Art of Philosophy. A Selection of Jerzy Perzanowski's Works*, Frankfurt: Ontos Verlag 2011, pp. 15-21.

"Jerzy Perzanowski's publications concerns mainly the problems of metaphysics and logic. His numerous unpublished works forms an important part of his total output, and actions are taken to arrange, edit and publish these works." (*ibid.*, p. 11.)

"1. Philosophy, taken from the point of view of its problems and methods is the collection of distinct philosophical disciplines. In fact meta-philosophical analysis leads to rather troublesome questions: Are philosophical disciplines methodologically and/or essentially related and connected? Are particular philosophical disciplines scientific? And, if the answer is not definite, to what extent is this so? Do philosophic disciplines form a uniform and organized (at least in its depth) system?

The most important factor in the characterization of any scientific discipline is its problematics. Hence, there are as many philosophical disciplines as there are different and autonomous families of philosophic problems.

Certainly, two philosophical disciplines are particularly distinguished: logic - for methodological reasons and ontology - for

essential ones.

Instead of considering the initial question in its full complexity, let us go to its kernel - ontology itself.

1. Philosophy, taken from the point of view of its problems and methods, is the collection of distinct philosophical disciplines. In fact, metaphilosophical analysis leads to rather troublesome questions: Are philosophical disciplines methodologically and/or essentially related and connected? Al-e particular philosophical disciplines scientific? And, if the answer is not definite, to what extent is this so? Do philosophical disciplines form a uniform and organized (at least in its depth) system? The most important factor in the characterization of any scientific discipline is its pl-oblematics. Hence, there are as many philosophical disciplines as there are different and autonomous families of philosophical problems. Certainly, two philosophical disciplines are particularly distinguished: logic - for methodological reasons and ontology - for essential ones. Instead of considering the initial question in its full complexity, let's go to its kernel - ontology itself.

Ontology and its parts.

2. Ontology is the theory of what there is, the theory of being. She considers the full ontological universe, all items that are possibles, describing and classifying them and searching for the principles of the universe, principles of taking together the plurality of ontic objects, particular beings, into one - the Being.

Thus, two questions govern ontological investigations: what is possible and why? The second question, concerning the being's principles, may strengthened to the deepest - last in the logical order - question: how that which is given, or rather what there is, is possible? The question above principles of being, i.e., general laws of nature, plus the question: what makes possible what there is and renders impossible what there isn't?

Because of its matter and problematics ontology is the most general discursive discipline. It is the general theory of possibility. By the nature of its questions it is also very modal.

3. Ontology has two sides: descriptive - phenomenological, and theoretical - formal. Hence, it is divided into three parts: onto-ontics (in brief: ontics), ontomethodology and ontologic.

4. Ontics is devoted to the selection of ontological problems and notions, their differentiation, classification and analysis. Doing ontics we construe the conceptual net of a given ontological theory, i.e. its categories. It is also one of the tasks of ontics to state ontological hypotheses, based on the previous analysis of concepts.

Ontics, being a part of ontology, is itself complex. Its further description depends on the general idea of ontology, on accepted classification of ontological concepts. For example, Ingarden has distinguished three parts of ontology: the material ontics, the formal ontics and the existential one. Notice that his ontology is, in our terms, ontics!

5. Ontomethodology concerns ways of doing ontology, methods and types of ontological constructions as well as principles of choice between ontological statements and theories. Examples of such ontomethodic principles are: the principle of non-contradiction, the principle of sufficient reason, and Ockham's razor.

Indication and discussion of the appropriate principles is necessary for sure for any critique of ontological theories, particularly the critique of the logical means used in ontology.

6. Ontologic is a logic of the ontic realm. It is an investigation of ontological connections, concerning particularly logical relations between pieces of ontic information. Also, it is a theory of the fundament of ontic relations.

Ontologic considers the organization of the ontological universe, trying to describe its mechanism. It describes the complexity of the Being, looking for its laws and base - the Logos.

7. Ontics is a purely descriptive and analytical discipline, ontologic is speculative and formal. They are, however, closely connected and interrelated disciplines, affecting one another. The product of ontics is a description, usually complex, of the ontological universe, whereas ontologic supplies different theories of this universe.

Certainly, at present ontic considerations are more common. In ontology we have many descriptions and claims, but not as many theories.

Among Polish ontologists, for instance, Ingarden may be regarded as typical ontics reasoner, while Leśniewski should be treated as a typical ontologician." (pp. 23-25)

(...)

"Comparison and conclusion.

42. We listed and commented on 18 variants of ontology, what certain doesn't exhaust the full spectrum of ontologies. On the other hand, the number of reasonably differentiated types of ontologies is undoubtedly smaller.

The classification of ontologies into types has certainly not to be arbitrary. It should both follow ontologies' goals and consider their contents.

We considered previously two such classifications:

First, following opposite descriptions of synthesis mechanism, into

STATIC vs. DYNAMIC ontologies;

and the second, according to three main planes of being, into

BEING vs. THOUGHT vs. LANGUAGE ontologies.

In addition, at least three more natural, self-explaining classifications should also be mentioned:

The third, according to the nature of ontologies' objects, into

MODAL vs. NON-MODAL ontologies.

It is easy to see that the proper ontologies of being are modal.

The fourth, taking into account the way of doing ontology, into

DESCRIPTIVIST vs. CONSTRUCTIVIST ontologies.

They either try to describe or try to construct the ontological universe.

Surely, the golden mean is the best. Particularly, ontologies of being should be - in proper proportion - both of this and that kind.

And, the fifth, regarding the role of the language in ontology: message vs medium, into

LINGUISTIC vs. EXTRALINGUISTIC ontologies.

Bringing a given ontology into one type we decide, in fact, to what extent the language, including the language of ontology itself, should be taken into account. Moderation is welcome. Certainly, the language is an important but not alone component of the world.

43. Plurality of ontologies is not without a reason.

Namely, we are interested in different aspects of being. Its full picture shows itself, however, only through comparison." (pp. 39-40)

From: Jerzy Perzanowski, "Ontologies and Ontologics", in: *Logic Counts*, edited by Ewa Zarnecka-Bialy, Dordrecht: Kluwer 1990, pp. 23-42.

"Another string of investigations – which will he analyzed in closer details in 2.3 – involves quantification theory. Logical and linguistic theories of quantifiers try to solve the problem of intentional objects by quantifying over non-existing individuals (allowing, therefore, for empty singular terms), or by skipping the classical presupposition of a non-empty domain (allowing for empty general terms). In that sense, free logics and other quantification theories can and have to be conceived as contributions to formal ontology (...).

The other dominating area of formal ontology, besides the one about intentional objects, is that of complex or compound beings of all kinds. We have already mentioned set theory and mereology, but at least starting with Russell's facts and Davidson's events there is a growing awareness of the fact that several different philosophical entities can tie formed from (or built out of, or defined based on) sentences. The discrimination of these entities provides us not only with a rich, but controlled ontology. It further yields a better understanding of what the objects of intensional logic are: What is it that we believe, what is necessary or possible, what can be promised or forbidden (...)

Again, it was a Polish logician, Jerzy Perzanowski, who first suggested the name "ontologic" for this area of research (see his foreword to Scheffler and Urchs (eds.) - *Ontologic. Essays in Formal Ontology* - Volume 2 of *Logic and Logical philosophy*, Torun: Copernicus University Press 1994). Perzanowski's "The Way of Truth" in Poli and Simons (eds.), *Formal Ontology* 1996 is an example of that kind of investigation. In the framework of what he calls qualitative ontology he starts from the standard Parmenidean principle of identity: Being is and nonbeing is not. He defines five conjugate notions of a being (understood as a subject of qualities). Perzanowski's aim is to prove theorems concerning these notions. For that purpose he needs some appropriate formalism. The axiomatics of "Primitive Theory of Being" is a first, but useful, approximation. He considerably improves the expressive power of this theory by assuming two additional abstract concepts of being: as a collection of all beings and as the unity or idea of all beings. By means of classical logic he thus achieves a substantial contribution to the ancient controversy between Plato and Parmenides concerning being and nonbeing: Beings are; Non beings are not; The being is; The nonbeing is; Being is; and Nonbeing is." (pp. 13-14)

From: Jan Faye, Uwe Scheffler and Max Urchs (eds.), *Things, Facts and Events*, Amsterdam: Rodopi 2000.

Some definitions

"Ontologic, a part of ontology devoted to the systematic development of formal ontological theories.

0. The general question of Ontology, Leibnizian in spirit, is: *How what is possible is possible?*, whereas the general question of Metaphysics is: *How what is real, or exists, is possible?* Clearly, Metaphysics, by definition, is a particular Ontology.

1. *Ontology*, in its most general and traditional version, is the theory of what there is, the theory of being. It considers the full ontological universe, including all items that are possible.

Two basic questions govern ontological investigation: what is possible and why? Or in a more general and deep way: how that which is possible, is possible?

Because of its questions ontology is the most general discursive discipline. As a matter of fact, it is the general theory of possibility. From other points of view, it is the general theory of relations, the general theory of things and properties or the theory of situations, events and processes.

2. Ontology is divided into three parts: ontics, ontomethodology and ontologic.

Ontics is devoted to the selection of ontological problems and notions, their differentiation, classification and analysis; to construction of the conceptual net of a given ontological theory and to statement of reasonable ontological hypotheses.

Ontomethodology concerns ways of doing ontology, their principles as well as methods and types of ontological constructions.

3. Ontologic is a logic of the ontic realm. It considers the organization of the ontological universe, trying to describe its mechanism.

Ontologic is a discipline of investigation of ontological connections, in particular logical relations between ontic statements.

4. Ontologic is therefore a discipline of logical philosophy. It is made after its receipt: Take an interesting (and real) ontological problem and try to answer it theoretically, i.e., by means of a theory.

To this end, we start with a conceptual analysis (which belongs to ontics), determining relevant primitive concepts and clarifying them enough to find reasonable axioms, which next are subject to logical deduction and appropriate semantical investigation. The method is sound if some theorems answer, or at least illuminate, the starting problem.

Ontologic is ontology done in this way, i.e., ontology produced by answering *ontological* question by means *logical* methods and procedures. In short, ontologic is ontology *modulo* logic: ontologic = ontology / logic."

From: *Ontologika* (a the text published in: www.filozofia.org.pl, but no more available)

Excerpts fron his publications: ontological modalities

"Alethic modalities are modifiers of semantical and logical components of judgements. Their classification obviously depends on the ontology and semantics that is presupposed. Some modalities are theoretical – useful for reasoning; some are practical or pragmatic – useful for action. Taking the first, at least four kinds of alethic theoretical modalities should be distinguished:

1. *A priori*, concerning what can be thought, used to delineate the realm of reason. Examples are *thinkable, understandable, reasonable, controvertible*, etc.

2. Logical, used for collection and comparison: *possible, necessary, contingent*, etc.

3. Metaphysical, concerning facts, what is real or actual: *actual, factual, to be a fact, to be true, making true, making actual*, etc.

4. Ontological, useful for describing the general and basic conditions for some families of objects or complexes. They concern the possibility of what there is, or what is possible; hence they are used for delineation of the most general field we can deal with – the realm of all possibilities – the ontological space. Examples are: *possibility, necessity, contingency, and exclusion taken in the sense of a condition; compossibility, coexistence*, and *eminent existence* in the sense of Leibniz, *(formal) possibility* in the sense of Ludwig Wittgenstein's *Tractatus; combinable, synthetizable and analysable; making possible, making impossible, being ontologically neutral;* and several common philosophical modalities de re: *by necessity, essentially, by its very nature,* etc.

The above classification has a clear counterpart in grammar: some modalities, mostly logical but also a priori and metaphysical ones, are adjective-like, some – chiefly ontological modalities – are noun-like. On the other hand, the logical modalities are quantifier-like modifiers (what is nowadays clarified by relational semantics).

There is a widely shared temptation to reduce some modalities to other ones, particularly ontological to logical modalities (and a fortiori noun- to adjective-modalities). Moreover, where such

reduction is difficult or counterintuitive, it is usual to ignore the unmanageable cases.

According to the kind of modalities one prefers, we have several types of modal reductionism: modal apriorism, factualism, etc. The most popular is modal logicism which claims that any alethic modality can and ought to be treated as a logical modality. The extreme version of this position – modal extensionalism (cf. Quine 1953) is the conjunction of two theses: first, that any alethic modality is reducible to logical modality(ies); and second, that any essential use of logical modalities is eliminable, formally expressed as a claim in favour of the eliminability of *de re* modalities by modalities *de dicto*. Extensionalism not only reduces modalities; it also substitutes set-theoretical ontology for any intensional ontology.

Ontological modalities are the key to any non-reductionistic ontology. The most august family thereof is that of Leibniz: *compossibility, compatibility, coexistence, and eminent existence*. Leibniz himself was fully aware of the role they play in ontology, warning against the "confusion of possibles for compossibles" (*Philosophical Papers and Letters*, ed. L. E. Loemker, 1969, p. 661).

A very manageable family of ontological modalities consists of: *making possible* (MP), *making impossible* (MI), *being ontologically neutral* (ON), which are introduced to formalize the fundamental ontological connections: attraction, repulsion, and indifference.

They are useful especially for the development of the combination ontology dealing, *inter alia*, with relations *simpler than* or *being in* and *combinable from* (cf. Perzanowski 1989). In addition, they enable us to express the Leibnizian modalities mentioned above.

There are two complementary approaches to the theoretical treatment of these modalities: the axiomatic and the semantic. From the semantic point of view, based on the description of the ontological space, MP is used to express formal conditions of synthesis.

Let *o* (*x*) denote the collection of all objects synthetizable from the object *x*, i.e. objects which can be obtained from the objects connected with *x* (in the most natural case – from the substance of

x), the relation *simpler than* or *being in*. The basic idea concerning making possible can now be expressed by:

MP(x,Y) ↔ y∈σ(*x*);

x makes possible *y* iff *y* is synthetizable from *x*.

The outlined family of ontological modalities enables us to define most of the notions used in ontology. In particular, using MP we can define:

Cons(*x*) := MP(*x*,*x*);

x is ontologically *coherent (consistent)* iff *x* makes itself possible.

C(*x*,*y*) := MP(*x*,*y*) & MP(*y*,*x*);

x and *y* are *compossible* iff each of them makes possible the other.

E(*x*,*y*) := ∃ *z y* MP(*z*,*x*);

x exists eminently in *y* iff there is something in *y* which makes *x* possible.

R(x,y) := ∀zx MP(*z*,*y*);

y is (ontologically) alternative to *x* iff everything in *x* makes *y* possible.

The first three notions were used by Leibniz, the last encodes the alternativity relation of the canonical models of relational semantics (cf. Chellas 1980). Using the chosen modalities we can therefore define relational semantics for modal logic, providing it with a solid ontological foundation. Note that the relation *R* closely connects with Leibniz's notion of eminent existence:

R(*x*,*y*) → E(*y*,*x*)

y is alternative to *x* implies that *y* eminently exists in x.

The axiomatic approach opens a rich field of research. Most of the axioms answer the basic questions of ontology. For example: Does making possible preserve ontological coherence?

A priori we have three positive answers, each of which yields a suitable axiom of preservation:

(*CR*) MP(x,y) & Cons(x) → Cons(y)

(*CL*) MP(x,y) & Cons(y) → Cons(x)

(*C*) MP(x,y) → (Cons(x) ↔ Cons(y))

Is making possible -monotonic? This yields, several axioms of (left/right) mono-tonicity, among others:

MP(↑) : MP(x,y) & x z → MP(z,y)

MP(↓) : MP(x,y) & z y → MP(x,z),

and so on.

Is the ontological universe uniform? I.e., does it include only coherent objects? Only compossible objects?

Again, positive answers to such questions yield the following axioms:

(Ucons) ∀ x Cons(x)

(UC) ∀ x,y C(x,y)

What interconnections hold between basic modalities?

Again, this yields a range of different axioms, for example:

The axiom of ontological trichotomy:

(OT) ∀ x,y (MP(x,y) ∨ MI(x,y) ∨ ON(x,y))

The axiom of full modalization:

(FM) ∀ x,y ON(x,y)

The contrary axiom of ontological extensionality:

(OE) ∀ x,y ON(x,y)

The axiom of ontological excluded middle, i.e., the ontological consistency axiom:

(OC) ∀ x,y (MP(x,y) ↔ MI(x,y)).

By taking appropriate families of axioms a wide range of different ontological theories may be defined.

Finally, notice that the above picture, following Leibniz, is chiefly based on the positive ontological modality making possible (MP). If instead we prefer the negative modality making impossible (MI) this would yield a Hegelian path in ontology." (pp. 560-562)

Parmenides: The Way of Truth

"1. Introduction

1.1 The Parmenidean 'way of truth' concerns what there is and what there is not: *estin te kai os ouk esti me einai*. (1) It concerns the basic ontological items: beings and nonbeings, as well as (the) being and (the) nonbeing. As we have learned from Parmenides, Zeno and Plato, (2) the way of Parmenides is the way of difficult truth, the way of metaphysical paradox.

1.2 Quite often the principal truth of Parmenides is formulated as the *ontological principle of identity: being is and nonbeing is not*. Usually this principle is considered tautologous (3) or even trivial.

I disagree. Triviality presupposes clarity. The principle, however, is neither clear nor evident. Also it is not obvious.

Is it true?

1.3 Both 'being' and 'is' are immediate derivatives of the verb 'be'. The verb itself has several variants. Can all these derivatives and variants be presented in a uniform way? Is, for example, 'Being is' a more adequate expression of the thought of Parmenides than

'Whatever is, is'? Next, to which items does the Parmenidean statement refer: to particular beings - like me, you, a ship, this pencil; or to their totality - the being; or to their unity - Being? Should Parmenides' statement be understood as 'the being is and the nonbeing is not', or rather as 'a being is and a nonbeing is not', i.e., 'any being is and no nonbeing is' or 'beings are and nonbeings are not'?

1.4 The problem was pointed out and discussed by Plato in *Sophist* as the crux of his refutation of the sophistic claim that nothing is false. Parmenides' spokesman, the Eleatic Stranger, is arguing there for Plato's conclusion that 'nonbeing has an assured existence and a nature of its own', recalling at the same time the warning of Parmenides: 'For never shall this thought prevail, that non-beings are, but keep your mind from this path of inquiry'. (4)

1.5 The answer to Plato's problem clearly depends on an explication of the four notions involved: *being, nonbeing, is* and *is not*. From a metalogical point of view it is also determined by the related logics: the logic of our reasoning and an appropriate logic of being.

1.6 Hereafter, the ontological notions are explained according to the qualitative approach to the notion of being: *a being is a subject of some qualities the being is the totality of all beings; Being is the unity of all beings*.

These quite ancient but yet obscure formulas are crucial for traditional ontology and they therefore deserve clarification.

Such a clarification requires an appropriate theory of qualities, as well as suitable theory of ontological connection connecting qualities with subjects. It is the latter, above all, which will be outlined in the present study.

1.7 Clarification comes, inter alia, through formalization. Formalization requires logic. In what follows I rely exclusively on classical logic. To be mor exact, standard classical logic is used as the logic of reasoning, whereas a suitable applied version of classical logic will serve as our logic of being.

1.8 In what follows a very general theory of ontological connection is provided.

In spite of its generality this theory enables us, as we shall see, to reconsider the classical ontological claims of Parmenides and to refute an anti-ontological claim that the notion of being is syncategorematic.

Also certain ontological theorems will be proved, including: Being is an Nonbeing is (sic!). *A being is, whereas a nonbeing is not*. Also: *Whatever is, is* - which is shown to be equivalent to *Whatever is not, is not*.

1.9 The paper is organized as follows: I start with general remarks concerning ontology and different approaches to the notion of being. Next, several classical questions of traditional ontology are discussed. After making our problems clear, I will introduce a formalism enabling us to study them in the full generality. Finally, the results of the paper are discussed in a manner introducing perspectives for a subsequent theory of qualities." pp. 62-63.

Notes

(1) Cf. Diels 1906, Parmenides B2.3. Notice a rather subtle problem connected with the translation of this claim (see Bodnar 1988b). Inter alia, the following translations have been offered: Diels 1906: "dass [das Seiende] ist und dass es unmöglich nicht sein kann", Bormann 1971: "dass [das Seiende] ist und das Nicht-Seiende ist nicht", Kirk and Raven 1957: "that it is and that it cannot not-be", Burnet 1957: "It is, and... it is impossible for it not to be", Taran 1965: "it is and to not be is not", Mannheim [translator] in Heidegger 1961: "it is, and... nonbeing is impossible".

(2) For Parmenides and Zeno cf. Kirk and Raven 1957, for Plato cf. *Parmenides* and particularly the *Sophist* in Plato 1961.

(3) Cf. Tatarkiewicz 1958.

(4) Cf. *Sophist*, 258 b-d.

   "The importance of the ontological component of Wittgenstein's *Tractatus* is generally recognized. And most of the contemporary philosophers (analytical at least) believe that the *Tractatus* is primarily a product of the first-rate metaphysical (*) thinker. Does it mean that Wittgenstein's ontology and the role it plays in the *Tractatus is* commonly and completely understood?

   Of course, we all know how rich in philosophical theories and insights *Tractatus* is. Let me mention a few of them: the picture theory of language (i.e. the theory of propositions, meaning and logical syntax), a semantical theory of logical truth (with a concept of "tautology", logical atomism, the principle of extensionality), new theory of identity, remarkable philosophy of logic, theory of philosophy as a "critique of language" as well as the *Tractatus* insights into ontology (which I am going to discuss below), epistemology (with the *Tractatus* solipsism and mysticism), religion and ethics. However, many people consider the *Tractatus* to be rather a bundle of theories and/or claims. The reason for that opinion is drawn from the *Tractatus* characteristic, aphoristical style and its lack of (fully developed) arguments. For example, Professor Max Black underlines in *A Companion to Wittgenstein's Tractatus* on the one hand the importance of the ontological component of the *Tractatus* but on the other hand he writes that Wittgenstein's great contributions to philosophical insights mentioned above are logically independent of his views about the nature of the world (p. 27)

   The main aim of my paper is to supply evidence that ontology and semantics of the *Tractatus* (as well as further philosophical

theories which are to be found therein) are much more coherent and interconnected than it is usually believed."

(*) or rather ontological, if we differentiate ontology -- a theory of what and why is possible from metaphysics -- a theory of what and why exists.

10. ———. 1985. "Some Observations on Modal Logics and the *Tractatus*." In *Philosophy of Mind, Philosophy of Psychology. Proceedings of the 9th International Wittgenstein Symposium, 19th-26th August 1984, Kirchberg Am Wechsel (Österreich)*, edited by Chisholm, Roderick M., 544-550. Wien: Holder-Pichler-Tempsky.

"[1] The modal character of the Tractarian ontology is now commonly recognized [2]. And it is clear that there must be some modal calculus (or, more carefully, calculi) implicit in the Tractatus. In the subjects' literature we may find several papers dealing with the question. Most of them point to Lewis' calculus S5 as the Tractarian modal logic. Is this answer right? Are arguments in its support convincing?

I do believe that:

(1°) the most popular answer mentioned above, even if true, should be argued for more thoroughly than it has been;

(2°) the modality structure implicit in the Tractatus, even when restricted to purely ontological modalities, is more complex than it looks in its usual descriptions, including the best available at the moment. In particular, both the basic role played by the notion of form-fundamental modality of the Tractatus, as I tried to argue in my *Some ontological and semantical puzzles of Wittgenstein's Tractatus* (1984) - and the question of its logic is simply omitted by the writers known to me.

However, truth is only one, and if not fully recognized, irrespective of how deeply it is hidden, it sends us words about itself, mainly indirectly, through some inaccuracies and/or inconsistencies in current opinion. This applies to the question under discussion, among others, in the following way: both necessity and possibility operators implicit in S5 or in any

similar logic are symmetrical, whereas these two notions in its most frequent Tractarian occurrences are not. Characteristic are also incoherencies which are to be found in claims made by the authors arguing, in fact, along the same line (compare A. Maury 1977 and G. H. von Wright 1972).

In what follows, starting with brief comments concerning D. Kaplan's, G. H. von Wright's and A. Maury's works, I will try to reexamine the problem and to provide some new arguments for a corrected version of von Wright's solution and to extend that solution by basing it on more fundamental theory of the notion of form. This theory, as you will see, provides solid philosophical foundations for relational semantics of intensional logics, foundations which are grounded on the Tractarian ontology." p. 544

[1] The paper's title clearly paraphrases the title of G. H. von Wright's master essay *Modal logic and the Tractatus* [in G. H. von Wright - *Wittgenstein* 1982, pp. 185-200]. Its ambiguity is intended, two main claims of the paper are thus hinted at. The first one concerns complexity of the modality structure of the Tractatus and points out several modal logics inhering in it. The second one shows the way of basing modal logics on the Tractarian ontology. To do that one reduces the fundamental notions of modal philosophy and relational semantics of modal logics (compatibility, possible worlds and relation of alternativeness) to the notion of form-the basic ontological modality of the Tractatus (comp. J. Perzanowski - *Some ontological and semantical puzzles of Wittgenstein's Tractatus*, 1984).

[2] The paper forms a third part of my bigger work in progress (comp. previous parts *Some ontological...*, cit. and *What is non-Fregean in the Tractarian semantics and why?* 1993) in which, after having articulated the proper place of ontology in the Tractatus, I am trying to formalize it. Due to the limitation of the paper's length it is still a sort of abstract. Its full text, with all arguments developed, is intended to be published elsewhere as *Modal logics and the Tractatus* - in preparation [the essay was never published].

    Originally published in Italian.

    "Fin dall'inizio la filosofia europea si è confrontata con la controversia tra monismo e pluralismo concernente la questione: quante cose esistono realmente? la questione dell'uno e dei molti.

    Ovviamente la nostra esperienza ci dice -- Molti; ma tante false affermazioni sono basate sull'esperienza!

    Nella tradizione europea ci sono due grandi linee di pensatori. La prima è quella dei filosofi monisti che incomincia con Parmenide di Elea e comprende i filosofi che sostengono che esiste *un* solo ente, che è costante e a priori. Più tardi il monismo fu generalmente connesso con la pretesa che questo ente unico sia Dio, o la Natura di essenza puramente logica. La seconda linea comprende i filosofi pluralisti e incomincia con Eraclito. Il pluralismo sostiene che ci sono molti enti mutevoli nonché -- nella maggior parte dei casi -- fenomenici. L'opposizione Monismo-Pluralismo non è una questione isolata e puramente teoretica. Ha una sua propria tensione interna, espressa in un senso del mistero per cui Uno è Molti e Molti è Uno; questa sensazione e la principale fonte del misticismo filosofico. In quanto segue cercherò di portare la luce della logica sulla controversia basilare su esposta."

12. ———, ed. 1987. *Essays on Philosophy and Logic. Proceedings of the Xxxth Conference on the History of Logic, Dedicated to Roman Suszko. Cracow, October 19-21, 1984*. Cracow: Jagiellonian University Press.

    Preface: "This volume contains nearly all the papers presented at the XXXth Conference on the History of Logic which was held in Cracow, October 19th-21st, 1984.

    The Conference was organized by the Department of Logic, Jagiellonian University and the Cracow Branch of the Polish academy of Sciences.

The papers published in the present Proceedings are published as preprints, whose copyright belongs to the authors. Their extended versions may be submitted elsewhere.

The potential reader should be warned that the traditional name of the Conference should be understood as 'Conference on Logic and Its History'. In fact, majority of papers published here deal with history of logic in a rather indirect way -- contributing directly to logic and/or philosophy.

This motivates the division of papers into three parts.

Papers from the third part are devoted to logical and philosophical achievements of the late Professor Roman Suszko.

It is a good tradition of Cracow Conferences that -- since 1972 -- most of them have been devoted to achievements of the most eminent representatives of the Polish logical and philosophical school.

Dedication of the XXXth Conference on the History of Logic to scientific achievements of the late Professor Suszko as well as obvious to any participant success of the Conference prove that Roman Suszko, pupil and former assistant of Kazimierz Ajdukiewicz, is widely recognized as the member of the Polish logical school in the *very* sense of the word.

The Proceedings of the XXXth Conference on the History of Logic are dedicated to the memory of Professor Roman Suszko, outstanding philosopher and logician, who was greatly respected and admired by all of us. The Editor"

"This exploratory paper offers, to those familiar with studying logics as consequence relations, an intriguing system of problems along with suggestions for confronting them. The author raises two questions: What is the size and number of matrices needed to characterize a logic given by a consequence relation? He motivates the questions by reminding us that for logics given

axiomatically the questions are simply answered by citing the Lindenbaum algebra for the language. The answers are not so simple when we consider consequence relations. He explores answering the question of how many matrices are needed to characterize a logic by determining the number of maximally consistent extensions of the logic." (Charles F. Kielkopf)

Abstract: "When, for a given propositional logic, we take semantics (say - matrix, algebraic or relational semantics) the most natural question is to estimate it. This means to answer the question: How many and how big matrices (algebras, frames, or - in general - structures) are necessary to characterise the logic?

In the case of matrix semantics, for logics understood traditionally - as sets of formulas closed under chosen rules and substitution - the general answer is easy and well-known: as was shown by A. Lindenbaum, it suffices to take exactly one matrix with the number of elements not exceeding the number of language's expressions.

However, when we consider consequence operators, or equivalently - sets of rules, the question is much more difficult and in many cases still open.

In what follows I will discuss the first part of it: How many structures are needed to characterise a given consequence operator? My general idea is to compare this number with the number of maximally consistent, i.e. Post-complete, logics of this consequence operator."

Towards a Re-Evaluation: Proceedings of the 14th International Wittgenstein-Symposium, Centenary Celebration, 13th to 20th August 1989 Kirchberg Am Wechsel (Austria)*, edited by Haller, Rudolf, Haller, Rudolf and Brandl, Johannes, 185-199. Dordrecht: Kluwer.

"1. Surely the above title is rather dark. Therefore, let me start with a few words of clarification. "Post-Tractatus" means either after "Tractatus" or a natural prolongation of the books' sequence: "Proto-Tractatus", "Tractatus",... . Hence the title of this paper means either the task of developing ontology built up after "Tractatus" clues, by taking its claims and lesson seriously, or clarification of the "Tractatus" text, by explaining notions and providing its claims with well-grounded arguments, trying thus to develop, step by step, a more advanced and better argumented version of Wittgenstein's treatise.

(...)

The paper is organized as follows: I start with a general review of the ontology of the Tractatus, putting emphasis on its modalities, particularly on its notion of the form. Semi-formalization of the thesis 2.033, in which the form is defined as the possibility of the structure, leads to isolation of the basic ontological modality - making possible. The formal theory of it, which is the crux of combination ontology, is outlined in the fourth chapter of the paper. Finally, several applications of this general ontology to the starting Tractarian ontology are given." p. 185.

372.

"1. Certainly, of the two title questions the second - why? - is more challenging and important. But also much more difficult.

To answer it we must not only collect and evaluate non-Fregean components of the semantics of the *Tractatus*, thus comparing them with Frege's semantics - which is rather easy; but we must also go into depth on both semantics, looking at their fundamentals and trying to find their basic conceptual and methodological framework. Such research, however, is much more difficult, partly because it leads us out of semantics into the broader and more general field of ontology, and to very fundamental metaphilosophical questions: to metaphilosophical considerations - because we try to compare two general philosophical theories; to ontological investigations - because of the nature of semantics.

2. Semantics provides language with the objective interpretation establishing connections between linguistic expressions and pieces of the world. To this end, however, it must be, if not arbitrary, developed inside a framework common for a language and the world. Such a framework can be provided only by a discipline more general than a theory of language, including semantics, as well as a theory of the world, i.e. by ontology - the most general theory of being, the theory of all possibilities.

Any proper semantics is indeed based on ontology - Frege's and Wittgenstein's semantics as well.

3. Full and well-motivated discussion of the title questions requires a book rather than a short article. Therefore, I shall limit the discussion to differences in the key-schemes of both semantics, plus very brief and rather cryptic remarks concerning the general framework of this comparison.

I start with a few general remarks concerning the type of philosophy which, to my mind, is common to Frege and the young Wittgenstein. Next, I will proceed to a reconstruction of the semantic diagrams which are basic for the two semantics

under investigation, emphasizing differences and trying to explain reasons for them." p. 357

22. ———. 1993. "Locative Ontology Part I-Iii." *Logic and Logical Philosophy* no. 1:7-94.

    The First Part is reprinted in: *Art of philosophy. A Selection of Jerzy Perzanowski's Works*, pp. 87-120.

    "To characterize his monograph-length essay, which is to be continued, the author writes: "The work has two aims: a philosophical one-to clarify one of the most important variants of verb-type ontologies, and a mathematical one-to enlarge the body of commonly known theories of order." A verb-type ontology is an axiomatization of the ordering relation of a use of a verb phrase based on the verb 'to be' if this axiomatization is developed for the philosophical purpose of understanding the structure of reality in so far as it is correctly represented with the use of 'to be' in question. Thus, set theory can be an ontology for 'to be a member of', while mereology is an ontology for 'to be a part of'. The author focuses on the locative use of 'to be' which means 'to be in'. Examples of such uses are 'She is in Schaan' and 'I am in her thoughts'.

    The author distinguishes the locative use from other uses, especially the mereological use. In general, the locative 'is' is not transitive. Most of the work is the mathematical work of characterizing and axiomatizing the (hitherto undeveloped) ordering relation for 'to be in'. The author explicitly requests readers to judge the mathematical work on its mathematical merits." (Charles F. Kielkopf - Karlsruhe)

    "The paper is organized as follows: I start with a general and brief overview of verb-type-ontologies, stressing the importance of the locative one. Next, three main relevant formal theories-of preorders, of mereologies as well as Leśniewski's Ontology - are presented. They are shown to be inadequate to formalise location.

    In this survey a special emphasis is put on premereologies intermediate between classical mereologies and preorders. Premereology seems to be very useful in the field of ontology

and metaphysics as the first, purely logical, approximation of the idea of condensation, i.e. the internal strength of unifying connections.

Next, I will pass to a discussion of locative ontologies, introducing them as a generalization of preorders, which fill in certain gaps occurring in both mathematical and philosophical approaches to orders. The bulk of locative ontology is presented in the Parts II and III, where locative orders are introduced and related to more familiar structures outlined previously. At the end, the philosophical content of locative ontology is presented and, finally, several cases of location in some important domains are pointed out." p. 11

23. ———. 1994. "Towards Psychoontology." In *Philosophy and the Cognitive Sciences. Proceedings of the 16th International Wittgenstein Symposium, 15-22 August 1993, Kirchberg Am Wechsel (Austria)*, edited by Casati, Roberto, Smith, Barry and White, Graham, 287-296. Wien: Hölder-Pichler-Tempsky.

    Reprinted in: *Art of philosophy. A Selection of Jerzy Perzanowski's Works*, pp. 135-146.

    "Psychoontology is *the ontology* of the psyche and of related matters. Hence, by definition, it is a case of *particular* and *applied* ontology.

    Here, following Leibniz's idea, ontology is defined (1) by its characteristic question: *How is possible?* More exactly: *How is x possible?*

    Now, the level of generality of a given ontology depends on the generality of its characteristic question, i.e. on the scope of the variable *x*. If it is the most general of all, we obtain the general ontology, which is the study of the following, most general, version of the ontological question: *How is what is possible, possible?*

    To answer it we must provide *a reason* for being possible as well as *a framework* for the study of *the ontological space* of all possibilities (2)." p. 287

(1) For a discussion of general ontology in comparison with particular ones cf. Perzanowski *Ontology and ontologics*.

(2) This is what Wittgenstein in the *Tractatus* named the *logical* space.

24. ———. 1994. "Reasons and Causes." In *Logic and Causal Reasoning*, edited by Faye, Jan, Scheffler, Uwe and Urchs, Max, 169-189. Berlin: Akademie Verlag.

    "Jerzy Perzanowski starts his considerations on *Reasons and Causes* with a few general remarks concerning the ontology of causality. Next, the basic family of relevant onto-logical operators, called *makers*, is introduced. Basic axioms are worked out for a formal setting of the mechanism of causal interactions in his 'Ontologic'. Perzanowski's paper concludes with the following deep truth: 'Anyway, one thing is clear. Determinism needs further, careful and subtle discussion' (188)."

26. ———. 1999. "Fifty Years of Parainconsistent Logics." *Logic and Logical Philosophy* no. 7:21-24.

    "One of the first logicians who questioned the status of the metaphysical and logical versions of the Principle of Consistency was Jan Łukasiewicz, the father of Polish logic and master of Stanislaw Jakowski. In his classic book *O zasadzie*

sprzecznosci u Arystotelesa (On the Principle of Consistency in Aristotle) published in 1910 Łukasiewicz endorsed only the ethical version of the principle of non-contradiction, as the rule which defends us against permanent error and lie, and against madness.

The view of Łukasiewicz, later reintroduced and made popular by Ludwig Wittgenstein, gave rise the question of finding an interesting and sufficiently rich logic which accommodates inconsistencies, allowing for their consistent investigation.

The problem was first solved in the previously mentioned work of Łukasiewicz's student Stanislaw Jaskowski.

Jaskowski's problem was fundamental, its solution profound and inspiring. His work could therefore be described as decisive, crucial for further investigation.

And that is precisely what happened.

Jaskowski's point of departure was a discourse, the situation of a discussion. When one asks: *Is it the case that A?*, and does not know the answer, one often considers both possibilities at once. Likewise, when defending A, one respects, at least during a honest discussion, an opponent who claims not-A. Which logic applies here?

Usually classical logic, though not in its full power and entirety. In this situation we are not ready to accept, for example, the rule of Duns Scotus, which from the contradiction: *A and not-A* allows us to infer any statement B, i.e., to conclude just everything. This is a little too much, however.

For, in real discussions between serious and honest opponents inconsistencies neither explode nor overfill the discourse.

Inconsistencies must be examined. Not prejudged. Nor worshipped as idols, as in the case of most Hegelians (excluding Graham Priest and other logical philosophers, I hope).

Quite the contrary. We examine them in order to find a remedy. In search of the understanding about their sources, reasons and

real consequences.

From this perspective, the mastery of Jaskowski's solution is simply striking.

Firstly, he created a discursive calculus D2, which fulfilled all the formal criteria we tend to impose on interesting paraconsistent logics.

Secondly, his construction in its deep structure enables us to consider inconsistencies occurring in a theory *T* as contingent statements in a related modal theory M(*T*) playing the role of its metatheory.

Thirdly, it often allows for the consistent examination of a given inconsistency. Sometimes even for the understanding of its mechanism and sources." pp. 23-24

27. ———. 1999. "Combination Semantics for Intensional Logics I. Makings and Their Use in Making Combination Semantics." *Logique et Analyse* no. 42:181-203.

Reprinted in: *Art of philosophy. A Selection of Jerzy Perzanowski's Works*, pp. 165-174.

Abstract: A very general framework for intensional semantics is outlined. In ontological spaces endowed with suitable ontological modalities (making possible, making impossible, etc.) a formal semantics for logical modalities (possibly, necessary, etc.) is defined. Its very idea is that x realizes possibly A if x makes possible (the combination) A.

Notice that sentences and their sets, as everything but simples, are combinations.

This idea is developed in three different ways generalizing the most common logical semantics and providing them with a natural metaphysical interpretation and foundation.

A special attention is put on the soft combination semantics which is shown to be complete for all intensional logics.

A list of conditions characteristic for basic modal logics is also provided.

"Each proper semantics must be based on ontology.

1. The above statement is a truism. But an important one. It is often forgotten, for in our time it is rather a common (and quite doubtful) conviction, that the only valuable ontology for contemporary semantics is the set-theoretical ontology.

In the past century set-theory indeed played the most important role in mathematics and logic and, in turn, in their philosophical applications. It is also true that the very paradigmatic case of a semantical analysis for formal languages, done by Alfred Tarski, is in fact a combination of set-theoretical and algebraic ideas.

Tarski - type semantics was extended in the sixties to the case of intensional languages providing us, as many believe, with a satisfactory method to deal with real philosophical problems.

2. In part, for sure, it is true. But only in part! If we distinguish, *inter alia*, between ontology of the being, including metaphysics (i.e., ontology of the world) on the one hand, and - on the other hand - the ontology of language and the ontology of mind (cf. *Ontologies and ontologics*, 1990), then by their close connection with formal investigations of concepts, set-theoretical and algebraic ontologies are closely connected with two later types of ontology, but not with the first!

Real philosophy, however, is about the being. Therefore, we are still in need of a more suitable and subtle semantics for it.

3. In what follows I will try to outline such a semantics, based on combination ontology, which is a part of a deeply modal version of a general theory of analysis and synthesis.

To this end, I will start with rather general remarks concerning modalities, with particular emphasis put on ontological ones, passing next to a rather general description of a theory of analysis and synthesis." p. 181

28. ———. 2001. "Parainconsistency, or Inconsistency Tamed, Investigated and Exploited." *Logic and Logical Philosophy* no. 9:5-24.

"In the paper, the notion of inconsistency is studied. The author proposes to use the term 'parainconsistency' rather than 'paraconsistency' with respect to inconsistent logics which contrive their inconsistency. Several illuminating examples of inconsistency are given. A brief history of the research related to the notion of (para)inconsistency is presented. Special attention is paid to the seminal contribution of Jaskowski. Ja ´skowski's modal approach to parainconsistency is discussed. G¨odel's and Ja´skowski's interpretations of modalities and contingencies are compared." Anna Gomolinska (Bialystok)

"Any educated person knows, or at least should know (1), that most cases of incoherencies, impossibilities and -- in a theoretical framework -- inconsistencies are rather suspicious members of a domain.

In particular, being inconsistent is a rather bad property of a theory. But why?

Our aim in the paper is, firstly, to discuss several answers to the question, and secondly, and more importantly to provide a proper frames to explain and to exploit inconsistencies. The framework which will force inconsistencies to work in a positive way, i.e., to enlarge and to deep our understanding of problems involved." p. 5

Reprinted in: *Art of philosophy. A Selection of Jerzy Perzanowski's Works*, pp. 199-222.

"Everything is a both a product of the decomposition (analysis) of a given object into simpler objects and of the synthesis (composition) of that which is composed of simpler components. In order to come to know a given object, it is necessary to reconstruct the process of analysis and synthesis, in the one and the other direction." p. 167

"Classical metaphysics has come back to life. Yet it has most definitely become a logical, hence scientific discipline not

aligned with the Kantians, but one set against them. Those who regenerated first philosophy as a discipline were above all the fathers of contemporary logic. Conceived in the latter half of the nineteenth century, classical logic has enjoyed a era rich in developments. In chronological order, we begin with Bolzano, Boole, Frege, Peirce, and Peano, followed by Russell, Whitehead and Wittengenstein, after whom the names worthy of mention are legion.

A second figure in the revitalisation of classical metaphysics as a live scientific philosophy was Franz Brentano, and beyond him his students and developers, amongst whom we find Kazimierz Twardowski, the father of Polish scientific philosophy.

Brentano united scientific philosophy with descriptive psychology and a resurrected descriptive metaphysics in the style of Aristotle. His pupils divided into schools following paths which, whilst differing from each other, always remained faithful to their source. In the case of phenomenology, special techniques of eidectic analysis were introduced into the Brentanian picture. A different case is that of Meinong and his co-workers, who worked Brentanian ideas into a general theory of objects and properties." pp. 170-171.

Reprinted in: *Art of philosophy. A Selection of Jerzy Perzanowski's Works*, pp. 45-68.

"Ontology is the general theory of the possibility, i.e., the theory of the realm of all possibilities -- the ontological space. Metaphysics, on the other hand, is the ontology of the world.

The world is the realm of existing items. After Wittgenstein's Tractatus: The world is all what is the case. In other words, all events taken as existing complexes (facts).

2. If we distinguish, *inter alia*, between the ontology of the being, including metaphysics (i.e., ontology of the world) on the one hand, and -- on the other hand -- the ontology of language and the ontology of mind, then we see, by close connection the

later two with formal investigations of concepts, that set-theoretical and algebraic ontologies are closely connected with them, but not with the ontology of being.

True philosophy, however, is about the being. Therefore, we are still in need of a metaphysics based on its background combination ontology with appropriate combination semantics. In need, by definition, of combination metaphysics.

3. In what follows, I will first try to outline such a semantics, based on combination ontology, which is a part of a deeply modal version of a general theory of analysis and synthesis. Next, I will try to apply it to the analysis of the most fundamental metaphysical notions.

To this end, I will start with general remarks concerning modalities, with particular emphasis put on ontological and metaphysical ones, passing next to a rather general description of a theory of analysis and synthesis." p. 93

31. ———. 2007. "In Praise of Philosophy." In *The Courage of Doing Philosophy. Essays Presented to Leszek Nowak*, edited by Brzezinski, Jerzy, Klawiter, Andrzej, Kuipers, Theo A.F., Lastowski, Krzysztof, Paprzycka, Katarzyna and Przybysz, Piotr, 375-394. Amsterdam: Rodopi.

    Reprinted in: *Art of philosophy. A Selection of Jerzy Perzanowski's Works*, pp. 25-40.

    The paper is an English translation by Matthew Carmody of en essay published in Polish in 2000.

    "Philosophy, in particular logic and ontology, occupy a key place in the structure of human knowledge.

    We conceive the world, one might say we grasp it, via concepts, that is mental pictures of the aspects of objects under consideration. Concepts in turn are connected according to the principles of an appropriate grammar, into propositions (logical judgments), that is, logical pictures of mentally-grasped fragments of the world.

    Concepts are junctions of information: propositions -- its pieces.

From here comes the role of logic, being the basic theory of those pictures of the world, fragments of grasped information. The logic of names examines the relations between concepts expressed in a given language. The logic of sentences examines the relations between propositions. This leads to an examination of the recombinations of the initial group of pictures, that is, to an examination of possibilities.

Their totality in turn constitutes the ontological space, the space of all possibilities.

Ontology, the true first philosophy, in this way creates the most general conceptual framework for the varied and diverse fields of human knowledge and strives towards the complete working-out of that framework. As a matter of fact. we owe to Leibniz the idea of the above modal definition of ontology and the opportunity of carrying out ontological research by pointing out the proper form of ontological questions: what is possible? And why? And, how is it possible?

In turn, particular ontological questions, for a given x, sound as follows: how is x possible? We have amongst other: metaphysical questions - How is the world possible? How is existence possible? And what, why and how is it that exists?: epistemo-ontological questions - How is knowledge itself possible? In particular, How is mathematical a priori knowledge of that which is real possible? Also questions of *axio-ontology* and *antropo*-ontology: What are values? How are they possible? How is evil possible? Who are people so evil?

And many other questions of this form.

The problems of real philosophy are real and great. Therefore they will be with us for as long as will survive human curiosity. For *all people by nature strive for knowledge* (Aristotle. *Metaphysics*, I, 1). including the deepest one.

This is why it is so important that reflection on these questions be carried out by true philosophers. For if philosophy, at the insistence of skeptics or under the pressure of positivists, were to give up concerning itself with its real problems, then they

would fall into hands of charlatans, causing great mental and social damage.

Therefore people should not forget about philosophical questions and the right way to deal with them." pp. 378-379.

Just as 'beautiful' points the way for aesthetics and 'good' for ethics, so do words like 'true' for logic.

...it falls to logic to discern the laws of truth. (Gottlob Frege, *Der Gedanke (The Thought*) p. 58

Logic stand guard at the border between Truth and False (Jan Łukasiewicz)

INTRODUCTION. "1. The old but still bright and fresh wisdom, expressed in both mottos, says that the chief task of logic is to search for the laws of truth and for rules governing transformations preserving truth, and sometimes falsity. The theory of Truth and Falsity is therefore the true kernel of logic, and logicians duty is, as Łukasiewicz said, to guard the border between Truth and Falsity.

2. In our poor, postmodern time quite a lot of people, including, unfortunately, a few logicians and many philosophers, are following rather Nietzsche than Frege trying to dissolve, at least in human beings' minds, this border together with other natural borders. They like to be happy on wanton vacation without any border, including the border between Truth and Falsity and the border between real and unreal.

Are guardians still doing their job? Do logicians fulfill their duty?

3. The masters certainly do. Recall, for example, seminal work of Tarski clarifying in set theoretical terms the classical definition of truth in the case of an extensional language, or the work of Kripke and others which extend Tarski's analysis to the case of intensional operators.

One gap however is surprising. Despite efforts of G. H. von Wright (1) and his followers we still have no reasonable, easy to catch and use, logics of Truth and Falsity, or rather logics of fundamental logical modalities: T -- *is true* and F -- *is false*.(2) Why?

The reasons are mental, not essential. As you will see, they are mainly misunderstanding and propaganda due to a false understanding of Tarski's work and Ramsey's redundancy thesis.

4. In a series of papers, with the present one as the starting item, I will outline natural T&F-logics showing, to my surprise, that between them are most of the basic modal logics. In particular, in the present paper I will pick out T&F-logics connected with the matrix method for classical logic. T&F-logics obtained in such way are counterparts of logics implicit in the matrix (algebraic) way of Boole and the tableau method of Beth, Smullyan and Fitting (cf. Melvin Fitting, *Intuitionistic Logic, Model Theory and Forcing,* North Holland, 1969).

In subsequent papers I will outline in turn T&F-logics of algebraic automorphisms, connections from the logical square of T and F, next iterations of T and F, cancellation, and deflation. Finally, I will compare logics from my list with T&F-logics pointed out in the literature of the subject.

5. A natural consequence of my list of T&F-logics is to use them to discuss several notorious problems concerning Truth and Falsity, including the most famous one -- the Liar Paradox. In "Modal Logics and the Liar" I will show that a modal approach to the Paradox by means of suitable T&Flogics is powerful and subtle enough to catch both its kernel and mechanism.

As a matter of fact, my interest in the Liar Paradox was the starting point for my investigation of T&F-logics. Since 1986 I

have lectured several times in several places trying to explain the power and usefulness of modal logic for a true discussion of the Liar Paradox and of similar obstacles to formal semantics based on the classical idea of *being true* and *being false*.(3)" (p. 95-96. N.B: *The mottos by Frege and Łukasiewicz in the original are in German and Polish*)

(1) Cfr. G. H. von Wright, *An Essay in Modal Logic*, Amsterdam, 1951.

(2) Called T&F-logics, in short.

(3) Special thanks should go to Jozef Misiek, who awoke me by his provocative claim that there are no proper T&F-logics and no reasons as well to consider the Liar Paradox to be a reasonable and genuine paradox. Read and see!

The volume contains 12 Essays, (the 2, 4, 6, and 9 are previously unpublished).

"Jerzy Perzanowski, born en 23rd April 1943 in Aix-Les-Bains. An outstanding Polish philosopher of international renown, he passed away on 17th May 2009 in Bydgoszcz. His original philosophical ideas include informatic monadology", "protophysics", and a rather un-usual blend of logic and ontology in what he called onto/logic where the slash is meant to suggest a quotient of ontology by logic. Perzanowski began as a logician, his early works being on modal logic, then gradually shifted his interest to "logical philosophy" (another of Perzanowski's coinages, meaning not so much philosophy of logic as philosophy informed by logic). Later, his interests turned to cognitive science and finally even to mysticism, again of a particular, logically informed, kind." p. 9.

Main publications in Polish

1. Perzanowski Jerzy. *Logiki Modalne a Filozofia*. Kraków: Nakladem Uniwersytetu Jagiellonskiego, 1989.

   Modal Logics and Philosophy. Ph.D thesis, Jagellonian University.

   Slightly modified version reprinted in *Jak filozofowac? Studia z metodologii filozofii,* pp. 262 - 346.

   "The first part of the essay contains basic information concerning the author's analysis of modalities. It presents a construction of perzanowski-cones (a three-dimensional topography of modal calculi) as well as an outline of his combination ontology. Within this framework he elaborates a new type of relational semantics, called "combination semantics of modal logics", which generalizes standard

semantics of modal systems. In a second part the author illustrates his thesis, that modal logic is the main tool of exact philosophy, particularly with respect to ontological rationalism.

He presents general rules concerning formalization of the philosophical modal expressions. He uses a fragment of Wittgenstein's *Tractatus* to demonstrate various methods which allow to obtain the categorial logic of a philosophical text. The following chapters on "modal fallacy" and contingency contain an extended discussion of his attempt to a modal analysis of "(onto)logical" rationalism. The chapter "Ontic primitivity and secondarity" presents four formalizations of Ingarden's conception of moments of existence. On the one hand, this serves as an exemplification of the previously developed formalities, on the other one it shows that logic has an active influence on philosophy, conducting systematic theoretical research in it. The author's very original and interesting essay ends with an English summary. However, it would be highly desirable to obtain a full version in English or German." Kit Fine: annotated bibliography. Books and Papers 1970-1981

Books

1. Prior, Arthur Norman, and Fine, Kit. 1977. *World, Times and Selves* . London: Duckworth.

   Contents: Preface by Kit Fine 7; 1. The Parallel between Modal Logic and Quantification Theory 9; 2. Egocentric Logic 28; 3. Supplement to 'Egocentric Logic' 46; 4. Worlds, Times and Selves 51; 5. Tensed Propositions as Predicates 67; 6. Modal Logic and the Logic of Applicability 84; 7. Supplement to 'Modal Logic and the Logic of Applicability' 102; 8. Postscript by Kit Fine: Prior on the Construction of Possible Worlds and Instants 116; Technical Appendix 162; Index of Symbols 169; Index of Names 171; General Index 173-175.

   "Before he died, Prior was working on a book to be entitled 'Worlds, Times and Selves'. This book was to deal, in one way or another, with the interplay between modal or tense logic, on the one hand, and quantification theory on the other. One of its main concerns was to show that modal and tense logic could stand on their own, that talk of possible worlds or instants was to be reduced to them rather than the other way round.

   Unfortunately, only the first chapter was completed. There were jottings for other chapters, but they were far from complete. However, it is clear that some of Prior's recently published papers would have been incorporated into the book, though probably in considerably modified form. So what I have tried to do is to collate the published and unpublished material

in such a way that the result is as close as possible to the book he had in mind.

This should explain the distribution of the unpublished material. The completed chapter appears, as it should, as the first paper of the collection. However, the other passages of unpublished material appear as supplements, in 3 and 7, to already published papers. This is because they are quite obviously expansions or elaborations of those papers. In order to avoid repetition, I have omitted some initial sections from the supplementary papers; and this accounts for their abrupt beginnings. I have also not used some other unpublished material, either because it was expository or because it was too fragmentary to be of interest.

The first paper explains in very simple terms the parallel between modal logic and quantification theory. It is a good introduction to the technical and philosophical problems that arise in the later papers.

The next three papers deal with the egocentric counterpart to ordinary tense or modal logic. They introduce the operator Q that picks out those propositions that correspond to instants, worlds or selves, as the case may be. The last sections of 2 and 4 and most of the supplement 3 are concerned with the formal development of Q or cognate notions.

The last three of Prior's papers, 5-7, deal with the problem of embedding the theory of instants or possible worlds within orthodox tense and modal logic respectively. Chapter 5 attempts to see how far the opposite view can be maintained. Chapter 6 is a particularly rich paper. It deals, among other things, with a world-calculus for the system Q, the logic of significance, and the extension of embedding results to possibilist quantifiers. The supplement elaborates further on some of these topics.

In his book, Prior would certainly have said more on this question of embedding. In the postscript, I have tried to fill this gap by discussing in detail his proposal for explaining instants and possible worlds within tense or modal logic. I had intended

to write on his whole philosophy of time and modality; but, for reasons of space, I decided to stick to this more limited topic.

I should like to thank the editors of *Nous, L'Age de la Science, American Philosophical Quarterly* , and *Theoria* for permission to publish papers originally published by them. I should also like to thank Mary Prior, Anthony Kenny and Hans Kamp. They all, in their own ways, helped me to produce this collection. Tom Dimas and Mike Ferejohn prepared the indexes." (*Preface* , pp. 7-8)

2. Fine, Kit. 1985. *Reasoning with Arbitrary Objects* . Oxford: Basil Blackwell.

   Contents: Preface VII; Introduction 1; 1. The General Framework 5; 2. Some Standard Systems 61; 3. Systems in General 147; 4. Non-Standard Systems 177; Bibliography 210; General Index 215; Index of Symbols 219-220.

   "This book deals with certain problems in understanding natural deduction and ordinary reasoning. As is well known, there exist certain informal procedures for arguing to a universal conclusion and from an existential premiss. We may establish that all objects of a certain kind have a given property by showing that an arbitrary object of that kind has that property; and having shown that there exists an object with a given property, we feel entitled to give it a name and declare that it has the property. So we may establish that all triangles have interior angles summing to 180° by showing of an arbitrary triangle that its interior angles sum to 180°; and having established that there exists a bisector to an angle, we feel entitled to give it a name and declare that it is a bisector to the angle.

   These informal procedures correspond to certain of the quantificational rules in systems of natural deduction. Corresponding to the first is the rule of universal generalization, which allows us to infer $\forall x \phi(x)$ from $\phi(a)$ under suitable restrictions. Corresponding to the second is the rule of existential instantiation, which allows us to infer $\exists(a)$ from $\exists x \phi(x)$, again under suitable restrictions.

In these inferences, certain terms play a crucial role; and it is natural to ask how they are to be understood. What role is to be attributed to the term a in the inferences from natural deduction? What is to be made of our talk of arbitrary triangles or indefinite bisectors in ordinary reasoning?

The present work is based upon the hypothesis that these critical terms refer to arbitrary or representative objects. The term a in the inferences from natural deduction functions as a name of a suitable arbitrary object. And our talk of arbitrary triangles or of indefinite bisectors is to be taken at its face value as also evincing reference to arbitrary objects.

The core of the work will be taken up with applying this hypothesis to two main systems of natural deduction: the one of Quine's *Methods of Logic* [52]; and the other of Copi [54], as amended by Kalish [67] and Prawitz [67]. In the case of each of these systems, we shall propose a generic semantics and then, by reference to that semantics, both establish soundness and motivate the restrictions on the rules.

We shall also be concerned to cover certain other topics. We develop the pure theory of arbitrary objects somewhat beyond the needs of the present application, partly because of its intrinsic interest and partly with a view to other applications. We embark on a general study of systems containing a rule of existential instantiation and prove some general results on what form satisfactory systems of this sort can take. Finally, on the basis of an alternative generic semantics, we develop certain presuppositional systems and relate them to existing systems in the literature. The book is divided into parts according to the topic treated, with the first part dealing with the pure theory, the second with the application to the systems of Copi and Quine, the third with systems in general that contain a rule of existential instantiation, and the last with the presuppositional systems.

The work here is part of a much larger project, one in which the theory of arbitrary objects is to be applied to the use of pronouns in natural language and to the use of variables in informal mathematics and programming languages. These

other topics have been altogether ignored, although the perceptive reader may pick up on certain intended points of contact. The closely related topic of developing a generic semantics for the ε- and η-calculi of Hilbert and Bernays [34] and Hailperin [57] has also not been considered; and my hope is that I shall be able to deal with it thoroughly elsewhere.

The book does not need to be read from beginning to end and the first part, in particular, may be consulted according to the demands from the other parts. The reader who is having difficulties may find my 'Natural Deduction and Arbitrary Objects' [85] helpful as a somewhat gentler introduction to the subject." (*Introduction* , pp. 1-2)

"The present monograph has been written more from a sense of curiosity than commitment. I was fortunate enough to attend the Munich Conference on the Philosophy of Mathematics in the summer of 94 and to overhear a discussion of recent work on Frege's approach to the foundations of mathematics. This led me to investigate certain technical problems connected with the approach; and these led me, in their turn, to reflect on certain philosophical aspects of the subject. I was concerned to see to what extent a Fregean theory of abstraction could be developed and used as a foundation for mathematics and to place the development of such a theory within a general framework for dealing with questions of abstraction. To my surprise, l discovered that there was a very natural way to develop a Fregean theory of abstraction and that such a theory could be used: to provide a basis for both arithmetic and analysis. Given the context principle, the logicist might then arguing that the theory was capable of yielding a philosophical foundation for mathematics, one that could account both for our reference to various mathematical objects and for our knowledge of various mathematical truths. I myself am doubtful whether the theory can legitimately be put to this use. But, all the same, there is surely considerable intrinsic interest in seeing how the theory of abstraction might be developed and whether it might be capable of embedding a significant portion of mathematics, even if the theory itself is in need of further foundation.

The monograph is in four parts. The first is devoted to philosophical matters and serves to explain the motivation for the technical work and its significance. It is centred on thee main questions: What are the correct principles of abstraction? In what sense do they serve to define the abstract with which they deal? To what extent can they provide a foundation for mathematics? The second part (omitted from the original paper) discusses the context principle, both as a general basis for setting up contextual definitions and in its particular application to numbers. The third part proposes and investigates a set of necessary and sufficient conditions for an abstraction principle to be acceptable. The acceptable

principles, according to this criterion, are precisely determined and it is shown, in particular, that there is a strongest such principle. The fourth and final part attempts to develop a general theory of abstraction within the technical limitations set out by the third part; the theory is equipped with a natural class of models; and it is shown to provide a foundation for both arithmetic and analysis." (*Introduction* , pp. IX-X)

4. ———. 2005. *Modality and Tense: Philosophical Papers* . New York: Oxford University Press.

   Contents: Preface; Introduction 1;

   I. Issues in the Philosophy of Language.

   1. Reference, Essence, and Identity (previously unpublished) 19; 2. The Problem of *De Re* Modality (1989) 40; 3. Quine on Quantifying In (1990) 105;

   4. Prior on the Construction of Possible Worlds and Instants (1977) 133; 5. Plantinga on the Reduction of Possibilist Discourse (1985) 176; 6. The Problem of Possibilia (2002) 214;

   III. Issues in Metaphysics.

   7. The Varieties of Necessity (2002) 235; 8. Tense and Reality (2005) 261; 9. Necessity and Non-Existence (previously unpublished) 321;

   IV. Reviews.

   10. Review of *Conterfactuals* by David Lewis (1975) 357; 11. Review of *The Nature of Necessity* by Alvin Plantinga (1976) 366; References 371; Index 379-387.

   "This volume collects together my published papers on tense and modality up to the present time. It contains two reviews, since the issues they discuss are still of interest; and it also contains a much expanded version of my paper, ‘The Reality of Tense’, now under the title ‘Tense and Reality’, and two previously unpublished papers. I have not included my technical papers on modal logic, even when they have contained philosophical material or have had an obvious

bearing on philosophical questions; and nor have I included any of my philosophical or technical papers on essence, even when they have dealt with the connection between essence and modality. I have added an introduction to the volume, outlining the central content of each paper and bringing out certain issues and themes that may not be evident from the papers themselves." (From the *Preface*)

5. ———. 2007. *Semantic Relationism* . Oxford: Blackwell.

   Contents: Preface VII; Introduction 1; 1. Coordination among variables 6; 2. Coordination within language 33; 3. Coordination within thought 66; 4. Coordination between speakers 86; Postscript: further work 122; Notes 133; References 141; Index 143.

   "The ideas behind these lectures had their origin in the early 1980s.

   There was then a great deal of excitement over the “new” theory of direct reference, but many of those who were attracted to the theory were also worried about the challenge posed by Frege’s puzzle. How could they claim, as the theory seemed to require, that the meaning of “Cicero = Tully” was the same as “Cicero = Cicero,” when the one was plainly informative and the other not?

   I myself faced a similar problem over the role of variables. I had previously attempted to develop a theory of variable or arbitrary objects. According to this theory, a variable should be taken to signify a variable object, something which we might loosely identify with the variable’s meaning or abstract role. However, even though the variables x and y, when considered on their own, should be taken to signify the same variable object, they should not be taken to signify the same variable object when considered together, since otherwise we would lose the relevant distinction between x = y and x = x. It seemed clear to me that the two problems were essentially the same and that there should be a common solution to them both, even though it was not then clear to me what the solution should be.

I worried about this issue on and off for the next 15 years until it dawned on me that it could only adequately be solved by making a fundamental break with semantics as it is usually conceived. One must take account of the meaning that expressions have, not only when considered on their own but also when they are considered together; the meaning relation between them is not simply to be regarded as a product of their individual meanings. Once we embrace this liberating thought, we can then see how the usual referential view of the meaning of variables and names can be retained and yet the difficulties over Frege-type puzzles avoided.

It was, therefore, opportune when Ernie Sosa asked me to give the first Blackwell/Brown lecture for the Fall of 2002, since this provided me with an opportunity to develop these ideas, which were still in a very inchoate form, and to discuss them with a wonderful group of philosophers.

(...)

The present book is loosely based upon the lectures I gave at Brown and I have tried to keep to something like the original lecture format. This has meant that a number of topics have not been pursued, though I have given a brief account of some of the more important of these topics in the final chapter. It has also meant that scholarly allusions have been kept to a minimum. I have, in particular, made no attempt to compare my own work with the loosely related work of Almog (2006), Fiengo and May (2005), Lawlor (2005), and Lieb (1983). This is a “bare-bones” account, simply intended to convey the essential ideas; and I hope later to provide a fuller account that is both broader in its scope and much more thorough in its treatment of particular topics." (*Preface* pp. VII-VIII)

6. ———. 2020. *Vagueness. A Global Approach* . New York: Oxford University Press.

   "The material for the lectures has been extracted from a much longer booklength manuscript, which I hope to publish separately. I therefore hope that the reader will bear in mind that many topics that are discussed perfunctorily or not at all in this monograph will be discussed at much greater length in the book. This is a bare bones account, without the usual qualifications or consideration of objections or discussion of alternative points of view.

   The first lecture (Chapter 1) was intended as an introduction to a general audience with no special expertise in the topic. It is, for this reason, very sketchy and, except for the last part, not at all original. The subsequent two lectures are more substantive. The first of these (Chapter 2) presents my general account of vagueness and the second (Chapter 3) discusses its application to three topics: the sorites argument (or paradox of the “heap”); the question of luminosity (or whether we can know our own minds); and the problem of personal identity, especially in its connection to the possibility of fission." (from the Preface)

Papers 1970-1981

1. Fine, Kit. 1970. "Propositional Quantifiers in Modal Logic." *Theoria* no. 36:336-346.

   "In this paper Ï shall present some of the results I have obtained on modal theories which contain quantifiers for propositions. The paper is in two parts: in the first part I consider theories whose non-quantificational part is S5; in the second part I consider theories whose non-quantificational part is weaker than or not contained in S5. Unless otherwise stated,

each theory has the same language L. This consists of a countable set V of propositional variables p1, p2,, the operators v (or), ~ (not) and □ (necessarily), the universal quantifier (p), p a propositional variable, and brackets (and), The formulas of L are then defined in the usual way." (p. 336)

2. ———. 1971. "The Logics Containing S4.3." *Zeitschrift für Mathematische Logik und Grundlagen der Mathematik* no. 17:371-376.

   "In this paper I prove some general results on logics containing S 4.3. In section 2 I prove that they all have the finite model property. Bull [1] has already proved thia result; but his proof is algebraic, whereas mine is semantic. In sections 3 and 4, I prove that they are all finitely axiomatizable. It follows from these results that they are all decidable. Finally, in section 5, I show that the lattice of S 4.3 logics is isomorphic to one on finite set of finite sequences of natural numbers. Needless to say, these results carry over to the extensions of the intermediate logic LC.

   In a paper on logics containing K4, I shall present another semantic proof that S4.3 logics have the finite model property and thereby also establish some results on compactness." (p. 371)

3. ———. 1971. "Counting, Choice and Undecidability." *Manifold* no. 11:17-22.

   Abbreviations: Continuum Hypothesis = CH; Axiom of Choice = AC.

   "In 1900 Hilbert stated 23 problems which he considered to be of crucial iaportance. The first of these was ’prove Cantor's Continuum Hypothesis'. Gödel (1939) and Cohen (1963) have shown that the hypothesis can neither be proved nor disproved. Their proofs are expounded in:

P. J. Cohen, *Set Theory and the Continuum Hypothesis* , Benjamin 1966.

P. J. Cohen, "Independence results in set theory", in *Studies ln Logic and the Foundations of Mathematics* , North-Holland 1965, pp. 39-54.

K. Gödel, "The Consistency of the Axiom of Choice and of the Generalized Continuum Hypothesis with the axiom of set theory", 1939, 4th printing, Princeton 1966·" (p. 71)

(...)

"The question now remains: what attitude should the working mathematician take towards CH? It is important to leave AC on one side at this point because it possesses a degree of self-evidence that CH certainly lacks.

There are, I think, two main attitudes. On the one hand, one could say there is no sense in which CH is true or false and give up looking for ways of settling the question. Instead, one would develop different set theories, with or without CH, somewhat in analogy to the alternative geometries of the 19th century. On the other hand, one could say that CH Is either true or false and look for new ways of determining which.

Two main ways suggest themselves. The first is to dispense with proof and to accept that hypothesis concerning transfinite cardinals which is most fruitful in consequences. The second is to search for new self-evident axioms that might settle CH.

These new axioms might be formulated in terms of set-theoretic notions or in terms of a new notion or new notions altogether.

The adoption of non-deductive procedures or the discovery of non-set-theoretic notions would conflict with two common views about mathematics, viz. that all mathematical knowledge is based upon proof and that all mathematical notions can be given a set-theoretic definition. Although it is too early to talk of feasibility, it is worth noting that these common views are based upon an analysis of extant mathematics. There seems to be no reason, in principle, why they should be true." (p. 82)

4. ———. 1972. "In So Many Possible Worlds." *Notre Dame Journal of Formal Logic* no. 13:516-520.

   "Ordinary modal logic deals with the notion of a proposition being true at least one possible world. This makes it natural to consider the notion of a proposition being true in *k* possible worlds for any non-negative integer *k*. Such a notion would stand to Tarski's numerical quantifiers as ordinary possibility stands to the existential quantifier.

   In this paper (1) I present several logics for numerical possibility. First I give the syntax and semantics for a minimal such logic (sections 1 and 2); then I prove its completeness (sections 3 and 4); and finally I show how to extend this result to other logics (section 5)." (p. 516)

   (1) The results of this paper are contained in my doctorate thesis, submitted to the University of Warwick in 1969. I am greatly indebted to my supervisor, the late Arthur Prior. Without his help and encouragement this paper would never have been written.

5. ———. 1972. "For So Many Individuals." *Notre Dame Journal of Formal Logic* no. 13:569-572.

   "In [2], Tarski introduces the numerical quantifiers.

   (...)

   Because of their definability, the numerical quantifiers have rarely been considered on their own account. However, in this paper I consider a predicate logic without identity which is enriched with numerical quantifiers as primitive. In section 1, I present the syntax and semantics for this logic; and in sections 2 and 3, I establish its completeness." (p. 569)

   [2] Tarski, A., *Introduction to Logic,* Oxford University Press (1946).

6. ———. 1972. "Logics Containing S4 Without the Finite Model Property." In *Conference in Mathematical Logic, London '70* , edited by Hodges, Wifrid, 98-102. Berlin: Springer Verlag.

"In [1], Harrop asked whether there were logics containing the intuitionistic logic IL which lack the finite model property [=fmp]. Jankov gave examples of such logics, but they were not finitely axiomatizable. By the Tarski-McKlnsey translation, Harrop's problem relates to the question of whether there exist extensions of the modal logic S4 without fmp. Makinson [2] showed that there are extensions of the modal logic M without fmp, but he could not extend his results to S4. In this paper, I shall exhibit logics containing both IL and S4 which lack fmp, but are finitely axiomatized and decidable." (p. 98)

(...)

"Finally, it should be noted that we can add axioms to the logics described above so as to obtain logics which are decidable, finitely axiomatized, complete for their intended interpretation, and yet without fmp." (p. 101)

7. ———. 1972. "Some Necessary and Sufficient Conditions for Representative Decision on Two Alternatives." *Econometrica* no. 40:1083-1090.

"A social decision rule is one that produces a social decision for each configuration of individuals' decisions. Such a rule is representative if it produces a social decision that is the result of repeatedly applying the rule of simple majority decision to decisions obtained

by that rule. We give necessary and sufficient conditions for a social decision rule for two alternatives to be representative." (p. 1083)

(...)

"The central problem of this paper is to find an alternative characterization of the representative functions. May in [1] gave

an alternative characterization of the simple majority decision functions, and Murakami in [2 and 3] established that monotonicity and self-duality are necessary conditions for being a representative or indirect majority decision function. (In fact, Murakami deals with what he calls democratic functions, i.e., representative functions which are non-dictatorial; but this latter condition may be added or left out at will.) However, he was not able to establish any sufficient conditions. In this paper, I establish his conjecture that strong monotonicity with self-duality is a sufficient condition.

I use this result and a new property of not being "zigzag" to prove that monotonicity, self-duality, and not being zigzag are necessary and sufficient conditions. (2)

Finally, I show that the monotonic, self-dual, and positive functions are exactly those definable in terms of the voting and jury operators." (p. 1084)

(2) P. C. Fishburn independently solved this problem in his paper "The Theory of Representative Majority Decision," *Econometrica* , 39 (1971), pp. 273-284. However, he uses a completely different method of proof and a slightly different condition in place of "not zigzag".

8. ———. 1973. "Conditions for the Existence of Cycles under Majority and Non-Minority Rules." *Econometrica* no. 41:889-899.

"This paper provides type I necessary and sufficient conditions for transitivity and quasi-transitivity under simple majority rule. (2) For type II conditions, a master list of orderings is

acceptable if the social rule generates a "rational" (e.g., transitive) social ordering whenever the individuals select their preference orderings from the list. A list ordering may be selected any number of times, and, in particular, it may not be selected at all. For type I conditions, on the other hand, each list ordering must be selected at least once, so that the list and the configuration of individual orderings must exactly match in the kind of orderings they contain. Thus for type II conditions it is the absence of certain kinds of orderings that blocks irrational social choice, whereas for type I conditions the presence of certain kinds of orderings may also contribute toward blockage.

Type II conditions have been determined for a wide variety of rules and under several definitions of rationality. Our main interest in this paper is in type I conditions for simple majority rule with rationality defined in terms of transitivity or quasi-transitivity. However, our method of argument will yield simple alternative proofs of some standard results on type I conditions and it will also yield the type I and type II conditions for transitivity under non-minority rule.

Section 1 lays down some relevant definitions. Section 2 proves the "min-midmax" theorem, which is the basis for all that follows. Sections 3 and 4, respectively, establish the conditions for transitivity and quasi-transitivity under majority rule.

Finally, Section 5 proves the min-mid-max theorem for the non-minority rule and establishes the condition for transitivity under that rule." (p. 889)

(2) The terminology of type I and II conditions is Pattanaik's [6]. Type II conditions were first proposed by Inada [3] and type I conditions by Pattanaik [5].

    Reprinted in: Alan Ross Anderson, Nuel D. Belnap, Jr., with contributions by J. Michael Dunn ... [et al.], *Entailment: The Logic of Relevance and Necessity,* Princeton: Princeton University Press, 1992 vol. II, pp. 208-231.

    "This paper gives a modelling for Ackermann's systems *Π'* and *Π"* , Anderson's and Belnap's system *E* and *R* , and several of their subsystems. The distinctive feature of this modelling is a point-shift in the evaluation of negation and entailment: the negation of a formula holds at a point if the formula itself fails to hold at a complementary point; and an entailment holds at a point if whenever its antecedent holds at a point its consequent

holds at an appropriately associated point. These rules enable negations of valid formulas to hold at a point and valid formulas themselves to fail to hold at a point. They also provide a grip on certain axioms involving negation or nested entailment." (p. 347, notes omitted)

(...)

The first two sections present the deductive-semantic framework; §51.1 specifies the models, and §51.2 the logics. The following two sections establish completeness; §51.3 for a minimal logic B, and §51.4 for **Π', Π", E** and the several subsystems. §51.5 outlines various alternative versions of the modeling. The last two sections contain applications of the modeling: §51.6 to the admissibility of modus ponens; and §51.7 to the finite model property and decidability. Many of the systems considered are shown to have these properties; see §63 for a further survey on decidability, and §65 for fundamental undecidabilily results." (pp. 208-209 of the revised reprint)

12. ———. 1974. "An Incomplete Logic Containing S4." *Theoria* no. 40:23-29.

"This paper uses the standard terminology of modal logic. It should suffice to say that: all logics contain the minimal logic *K* and are closed under necessitation, substitution and modus ponens; frames consist of a relation defined on a non-empty set of points; models consist of a frame with a valuation; and truth-at-a-point is defined and notated in an obvious way; with the formula □ *A* true at a point iff *A* is true at all accessible points. The formula *A* is true in (satisfied by) a model if it is true in all (some) points of the model; *A* is strongly verified in a model if all substitution-instances of *A* are true in the model; and *A* is valid in a frame if *A* is true in all models based upon the frame, *A* set of formulas is true, strongly verified, or valid if all of its members are. Unless otherwise stated, all logics contain S4 and all models and frames possess reflexive and transitive relations.

A logic is complete if any formula valid in all frames that validate the logic is in the logic. This paper exhibits a logic L containing S4 that is not complete." (p. 23)

13. ———. 1974. "Logics Containing K4. Part I." *Journal of Symbolic Logic* no. 39:31-42.

    "There are two main lacunae in recent work on modal logic: a lack of general results and a lack of negative results. This or that logic is shown to have such and such a desirable property, but very little is known about the scope or bounds of the property. Thus there are numerous particular results on completeness, decidability, finite model property, compactness, etc., but very few general or negative results.

    In these papers I hope to help fill these lacunae. This first part contains a very general completeness result. Let $I_n >$ be the axiom that says there are at most *n* incomparable points related to a given point. Then the result is that any logic containing K4 and $I_n >$ is complete.

    The first three sections provide background material for the rest of the papers. The fourth section shows that certain models contain no infinite ascending chains, and the fifth section shows how certain elements can be dropped from the canonical model. The sixth section brings the previous results together to establish completeness, and the seventh and last section establishes compactness, though of a weak kind. All of the results apply to the corresponding intermediate logics." (p. 31)

14. Fine, Kit, and Fine, Ben J. 1974a. "Social Choice and Individual Ranking I." *Review of Economic Studies* no. 41:303-322.

    "This paper investigates social positional rules. The rules are social in that they produce a social output for any configuration of individual preference orderings. They are positional in that the output produced depends only upon the positions occupied by each alternative in the individual preference orderings. (3)

    Social rules may be distinguished by the form of their output, be it a quasi-ordering, choice structure or complete ordering. For each form of output, we shall determine the class of social rules that satisfy certain desirable conditions. Part one deals with quasi ordering rules; part two will deal with the other types of rules.

Indeed, this part shows that certain desirable conditions are uniquely satisfied by the so-called positional rule. One alternative is as good as another by this rule if any individual's ranking of these cond alternative can be matched by as high a ranking of the first alternative by some possibly different individual. The individuals'rankings should be as good for the one alternative as for the other." (p. 303)

(*) Some of the results of this paper are contained in B. Fine's B.Phil. thesis, Oxford1971. We should like to thank the editor and a referee for many helpful suggestions.

(3) There have been several recent papers on positional rules. See [2], [3], [5] and [8]. However, most of the results of these papers overlap with the material of Part II (which is forthcoming in this journal) rather than Part I. Further details will be given there, but let us note that Smith [8] also has a variable number of individuals and a composition condition (his separability).

15. ———. 1974b. "Social Choice and Individual Ranking II." *Review of Economic Studies* no. 41:459-475.

"In Part I of this paper it was shown that certain appealing conditions forced any social quasi-ordering rule to include the positional rule, which is itself the intersection of all finite ranking (f.r.) rules. These conditions are slightly strengthened in the first three sections of this part, but this allows us to characterize in Section 3 the rules that also satisfy the additional properties as the intersection of some set of f.r. rules. In case a continuity property, which can be interpreted as a non-veto condition applied to groups, does not hold, the set of f.r. rules must be extended to include transfinite weightings. Section 1 finds sufficient conditions for a quasi-ordering rule to be positional. This is used in Section 2 to prove the results contained in Section 3 for the special case of a social ordering rule, when a single f.r. rule emerges. This special case is then generalized in Section 3.

In Section 4, for the first time in the paper, we analyse conditions that recognize social decision depending upon the number of alternatives. Previously, only the number of individuals has been effectively allowed to vary. Again, simple and natural properties have powerful consequences, and it is thereby shown that the Borda rule is a compelling choice for making social decision, given a veil of ignorance, that is no knowledge of the special features of the individuals and alternatives concerned. In case only a quasi-ordering rule is required, social decision is based on the intersection of a set of f.r. rules symmetrical about the Borda rule.

In Section 5 we turn to choice structureules. First a positional choice structure is defined. It is the strongest such rule containing all the f.r. rules, since an alternative in a set belongs to the choice from that set iff for some f.r. it is best in the set. This last condition is shown to be equivalent to demanding that the ***HC*** of that element does not belong to the convex hull of the

HC of the other alternatives in the set. Then an outline is made for a conditions analysis of the rule: it is found to be the weakest rule satisfying certain conditions, in the sense that any other rule satisfying those conditions must be more decisive. In this, the method, results and analysis correspond to Part I's consideration of the positional quasi-ordering rule.

Section 6 is devoted to an examination of some questions concerned with the independence of conditions and Section 7 contains concluding remarks. The above only sketches the major results of thispaper. In addition,the analysis of normal social quasi ordering rules in Section 2 and Section 3 has obvious relevanceto the theory of production and utility under risk in the presence of indivisibility.

Finally, it should be noted that throughou this part, individual preferences are assumed to be antisymmetrical.Whilst the complications posed by individual indifference were overcome in Part I (Section6), a more general analysis becomes analytically cumbersome and presents more problems here. Nevertheless many of the results, especially analysis by conditions, do apply more generally, though possibly ith slight modifications." (pp. 459-460)

(*) The first part of the paper [1974a] was written up by K. Fine and the second by B. Fine. Both authors have contributed to all sections of the paper, though the first has contributed more to the material on the positional rule and the second to the material on normal social rules. Some of the resultsfor ordering rules in this paper have been independently established by Smith [Smith, J. H. "Aggregation of Preferences with Variable Electorate", *Econometrica* . Vol. 41, No. 6 (Nov., 1973), pp. 1027-1041].

16. Fine, Kit. 1975. "Vagueness, Truth and Logic." *Synthese* no. 30:265-300.

    Reprinted in: Rosanna Keefe & Peter Smith, *Vagueness: A Reader,* Cambridge: MIT Press, 1996, pp. 119-150.

    "My investigation of this topic began with the question "What is the correct logic of vagueness?" This led to the further question

"What are the correct truth-conditions for a vague language?" And this led, in its turn, to a more general consideration of meaning and existence.

The contents of the paper are as follows. The first half contains the basic material. Section 1 expounds and criticizes one approach to the problem of specifying truth-conditions for a vague language. The approach is based upon an extension of the standard truth-tables and falls foul of something I call penumbral connection. Section 2 introduces an alternative framework, within which penumbral connection can be accommodated. The key idea is to consider not only the truth-values that sentences actually receive but also the truth-values that they might receive under different ways of making them more precise. Section 3 describes and defends the favoured account within this framework.

According to this account, as roughly stated, a vague sentence is true if and only if it is true for all ways of making it completely precise. The second half of the paper then deals with consequences, complications and comparisons of the preceding half. Section 4 considers the consequences that the rival approaches have for logic. The favoured account leads to a classical logic for vague sentences; and objections to this unpopular position are met. Section 5 studies the phenomenon of higher-order vagueness: first, in its bearing upon the truth-conditions for a language that contains a definitely-operator or a hierarchy of truth-predicates; and second, in its relation to some puzzles concerning priority and eliminability.

Some of the topics tie in with technical material. I have tried to keep this at a minimum.

But the reader must excuse me if the technical undercurrent produces an occasional unintelligible ripple upon the surface. Many of the more technical passages can be omitted without serious loss in continuity." (p. 265)

17. ———. 1975. "Normal Forms in Modal Logic." *Notre Dame Journal of Formal Logic* no. 16:229-237.

"There are two main methods of completeness proof in modal logic.

One may use maximally consistent theories or their algebraic counterparts, on the one hand, or semantic tableaux and their variants, on the other hand. The former method is elegant but not constructive, the latter method is constructive but not elegant.

Normal forms have been comparatively neglected in the study of modal sentential logic. Their champions include Carnap [3], von Wright [10], Anderson [l] and Cresswell [4]. However, normal forms can provide elegant and constructive proofs of many standard results. They can also provide proofs of results that are not readily proved by standard means.

Section 1 presents preliminaries. Sections 2 and 3 establish a reduction to normal form and a consequent construction of models. Section 4 contains a general completeness result. Finally, section 5 provides normal formings for the logics T and K4." (p. 229)

Reprinted in: *Modality and Tense. Philosophical Papers,* as chapter 10, pp. 357-365.

"This is an excellent book. It combines shrewd philosophical sense with fine technical expertise; the statement of views is concise and forthright; and the level of argument is high." (p. 451)

(...)

"Lewis suggests that merely possible worlds are like the actual world, 'differing not in kind but only in what goes on at them'. Indeed, for him there is no absolute difference between the actual world and the others: the difference is relative to a particular possible world as point of reference. A similar view has been held about the present time, but it is hard to accept for possible worlds. On the logical construction view, the actual world is distinguished by the property that all of its propositions are true. Here 'true' is an absolute term. It is not defined as truth in the actual world but, on the contrary, truth-in-a-world is defined as set-theoretic membership." (p. 455).

19. ———. 1975. "Some Connections between Elementary and Modal Logic." In *Proceedings of the Third Scandinavian Logic Symposium* , edited by Kanger, Stig, 15-31. Amsterdam: North-Holland.

"A common way of proving completeness in modal logic is to look at the canonical frame. This paper shows that the method is applicable to any complete logic whose axioms express a XA-elementary condition or to any logic complete for a A-elementary class of frames. We also prove two mild converses to this result. (1) The first is that any finitely axiomatized logic has axioms expressing an elementary condition if it is complete for a certain class of natural subframes of the canonical frame. The second result is obtained from the first by dropping 'finitely axiomatized', and weakening 'elementary' to 'A-elementary'.

Classical logic is used in the formulation and proof of these results.

The proofs are not hard, but they do show that there may be a fruitful and non-superficial contact between modal and elementary logic. Hopefully, more work along these lines can be carried out.

§ 1 outlines some basic notions and results of modal logic. For simplicity, this is taken to be mono-modal. However, the results can be readily extended to multi-modal logics and, in particular, to tense logic.

§ 2 proves the first of the above results and a related result as well; § 3 proves the second of the above results; and finally, § 4 constructs counterexamples to some plausible looking converse results." (pp. 15-16)

(1) After writing this paper, I discovered that A.H. Lachlan had already proved the first of these 'mild converses' in [5]. His proof uses Craig's interpolation theorem, whereas mine uses the algebraic characterization of elementary classes. R.I. Goldblatt [4] independently hit upon this latter proof at about the same time as I did.

He also has a counter-example to the converse of this result. It is similar to the one in § 4.

I should like to thank Steve Thomason for the references above and for some helpful comments on the paper.

    "This paper presents a theory of cxtensional and intensional entities. The entities in question belong to a hierarchy that begins with individuals, sets, properties and propositions. The hierarchy extends to higher orders, both extensional and intensional. Thus it contains sets of propositions, properties of sets, properties of such properties, and, in general, it contains relations-in-intension and relations-in-extension over types of entities already in the hierarchy.

    The theory does not say what a proposition or property is. Rather, a possible worlds account of these entities is taken for granted. Thus a proposition is regarded as a set of possible worlds, a property as a set of world-individual pairs, and similarly for the other intensional entities.

    What the theory does is to characterize and investigate various properties of the entities in terms of possible worlds. These properties include existence, being purely general or qualitative, being logical, having an individual constituent, and being essentially modal. Thus the theory is ontological rather than linguistic. Its main concern is with the ontological status of the various entities and not with their relation to language." (p. 135)

25. ———. 1978. "Model Theory for Modal Logic Part I: The ' *de re / de dicto'* Distinction." *Journal of Philosophical Logic* no. 7:125-156.

"It is an oddity of recent work on modality that the philosopher's main concern has been with quantificational logic whereas the logician's has been with sentential logic. There have, perhaps, been several reasons for this divergence of interest. One is that the area of sentential modal logic is already rich in logical problems; and another is that the semantics for quantified modal logic has been in an unsettled state. But

whatever the reasons have been in the past, the time would now seem ripe for a more fruitful interaction between these two approaches to the study of modality.

My aim in these papers has been to bring the methods of model theory closer to certain common philosophical concerns in modal logic. Indeed, most of the results answer questions that arise from some definite philosophical position. In this respect, my approach differs from that of Bowen [1] and others, who attempt to extend the results of classical model theory to modal logic. Although this approach has its attractions, it also suffers from two drawbacks. The first is that most of its results are devoid of philosophical interest; and the second is that many standard results of classical model theory, such as the Interpolation Lemma, do not apply to some standard modal logics, such as quantified S5 (see my paper [5]).

The philosophical position that underlies the results of the first two parts of this paper may be called *de re* scepticism. It is the doctrine that quantification into modal contexts does not, as it stands, make sense. Call a sentence *de dicto* if, in it, the necessity operator never governs a formula that contains a free variable. Then for the *de re* sceptic, only *de dicto* sentences, or their equivalents, are legitimate." (p. 125)

26. ———. 1978. "Model Theory for Modal Logic Part II: The Elimination of ' *de re'* Modality." *Journal of Philosophical Logic* no. 7:277-306.

"In the first part of this paper, two philosophical positions were introduced: *de re* scepticism; and anti-Haecceitism. According to the first, quantification into modal contexts does not, as it stands, make sense; and according to the second, the identity or non-identity of individuals in distinct possible worlds is a matter of convention. It was shown that the two positions are

equivalent in the sense that whatever first-order modal sentence is legitimate for the one is also legitimate for the other.

A soft and hard version of each of these positions may be distinguished. According to the soft *de re* sceptic, it is possible to make sense of *de re* modal discourse; and according to the soft anti-Haecceitist, it is possible to define coherent identity conditions for individuals across possible worlds. Both of the soft positions, then, are compromising ones in that they allow that ordinary modal discourse may be reconstructed. The hard versions of the positions, on the other hand, deny that any such reconstruction is possible.

The soft *de re* sceptic may reconstruct ordinary modal discourse in various ways. One way is to reinterpret either quantification or modality (or both) so that each *de re* sentence is equivalent to one that is *de dicto* . Although this method has been prominent in the literature, I shall deal with it only incidentally here. I hope to deal with it more fully elsewhere. Another way is to add axioms to the standard modal logic so that two conditions are satisfied. The first (eliminability) is that every *de re* sentence should have a *de dicto* equivalent relative to the resulting system. The second (conservativeness) is that no *dicto* sentence should be provable in the resulting system that is not already a theorem of standard modal logic." (p. 277)

27. ———. 1979. "Failures of the Interpolation Lemma in Quantified Modal Logic." *Journal of Symbolic Logic* no. 44:201-206.

"Beth's Definability Theorem, and consequently the Interpolation Lemma, fail for the version of quantified S5 that is presented in Kripke's [7]. These failures persist when the constant domain axiom-scheme $\forall x \Box \varphi \equiv \Box \forall x \varphi$ is added to S5 or, indeed, to any weaker extension of quantificational *K* .

§1 reviews some standard material on quantificational modal logic. This is in contrast to quantified intermediate logics for, as Gabbay [5] has shown, the Interpolation Lemma holds for the logic CD with constant domains and for several of its extensions. §§2—4 establish the negative results for the systems

based upon S5. §5 establishes a more general negative result and, finally, §6 considers some positive results and open problems. A basic knowledge of classical and modal quantificational logic is presupposed." (p. 201)

Abstract. "This paper is part of a general programme of developing and investigating particular first-order modal theories. In the paper, a modal theory of propositions is constructed under the assumption that there are genuinely singular propositions, ie. ones that contain individuals as constituents. Various results on decidability, axiomatizability and definability are established."

"In some recent work ([7], [8], [9], [10]), I have attempted to carry out a dual programme of developing a general model-theoretic account of first-order modal theories, on the one hand, and of studying particular theories of this sort, on the other. The two parts of the programme are meant to interact, with the second providing both motivation and application for the first. The present paper belongs to the second part of the programme and deals with the question of giving a correct essentialist account of propositions.

My approach is distinctive in two main ways, one linguistic and the other metaphysical. On the linguistic side, I have let the variables for propositions be both nominal and objectual. That is to say, the variables occupy the same position as names and are interpreted in terms of a range of objects, which, in the present case, turn out to be propositions. This approach stands in contrast to the earlier work of Prior [17], Bull [1], Fine [4], Kaplan [14] and Gabbay [12], [13], in which the variables are sentential (they occupy the same position as sentences) and are interpreted either substitutionally or in terms of a range of intensional values." "The aim of this paper is to formalize various metaphysical theories within a first-order modal language. The first part deals with modal set theory. The later parts will deal with propositions, possible worlds, and facts.

Such an undertaking is relevant both to logic and to metaphysics.

Its relevance to logic lies mainly in its bearing on the model theory for first-order modal languages. I have begun to develop such a theory in [8]. The consideration of particular theories can then provide both an application of and motivation for general results in this field. There is already a fruitful interaction between the proof of general results and the consideration of particular first-order theories within classical model theory; and the hope is that there should be as beneficial an interaction within modal logic.

The relevance of the undertaking to metaphysics consists mainly in the general advantages that accrue from formalizing an intuitive theory. First of all, one thereby obtains a clearer view of its primitive notions and truths. This is no small thing in a subject, such as metaphysics, that is so conspicuously lacking in proper foundations.

But once a formalization is given, one can establish results about the theory as a whole and thereby obtain that overall

view of a subject that philosophers often strive for but rarely obtain." (p. 177)

(...)

"The plan of this part of the paper is as follows. §1 contains an informal discussion and justification of our axioms for modal set theory. §2 then presents the formal theories. §3 develops a proof- and a model-theory for class abstracts in modal set theory and establishes a useful result on transferring abstracts from classical set theory into a modal context. In §4, it is shown that the formal theories are equivalent in that any two of them share the same theorems in their common language. The proof of equivalence contains general result on when the possible worlds semantics for a given modal theory can be represented within that theory itself. The next section discusses the adequacy of our formalizations and shows that, in a certain sense, they capture all of the essential truths about sets as such. The last section is concerned with the identity of sets and places the problem within a general account of the identity of objects." (p. 178)

[8] Fine, K., 'Model Theory for Modal Logic I, II, III', *The Journal of Philosophical Logic* , (1978) 125-56, (1978) 277-306, and to appear. [1981, 293-307]

31. ———. 1981. "Model Theory for Modal Logic. Part III: Existence and Predication." *Journal of Philosophical Logic* no. 10:293-307.

"This paper is concerned with the technical implications of a certain view connecting existence to predication. This is the view that in no possible world is there a genuine relation among the nonexistents of that world or between the nonexistents and the existents. (1) The meaning of the term ‘genuine’ here may be variously explained. On an extreme interpretation, all relations are ‘genuine’, so that none of them are to relate non-existents.

On a milder interpretation, the genuine relations are those that are simple or primitive in some absolute sense. But even without appeal to an absolute concept of simplicity, we can

require that all relations should be analyzable in terms of some suitable set of relations, relating only existents to existents.

In order to make our results applicable to the thesis, we shall suppose that the primitive non-logical predicates of our language correspond to the genuine relations, whatever they might be taken to be. Thus, the linguistic formulation of the thesis becomes that the primitive predicates of the language should only be true, in each world, of the existents of that world.

Of course, the thesis might have been given a linguistic formulation, without any reference to relations, in the first place.

The thesis is an instance of what has been called Actualism. This is the ontological doctrine that ascribes a special status to actual or existent objects. Another form of the doctrine, so-called World Actualism, says that the behaviour of nonexistents is supervenient upon the behaviour of the existents, that two possible worlds which agree in the latter respect cannot differ in the former respect. The present thesis, by contrast, might be called *Predicate Actualism* . It should be clear that Predicate Actualism implies World Actualism, at least if the predicates used to describe the world are to express 'genuine' relations; for then there are no relationships involving nonexistents by which two worlds might be distinguished. On the other hand, World Actualism does not, as it stands, imply Predicate Actualism." (p. 293)

(*) This paper is the third and final part of a series (see the references below). It was completed and submitted to the *Journal of Philosophical Logic* in 1977, at about the same time as the other parts. But because of some mishap in the mail, its publication was delayed. The present part is independent from the other parts in its results, but draws upon the terminology of Section 2 of Part I.

I should like to thank the editor, R. Thomason, for many valuable remarks on the earlier version of the paper.

(1) I have briefly discussed this thesis elsewhere. The reader may like to consult Section 7 of [11], pp. 151 and 156-160 of [2], p. 564 of [3], and Section 8 of [7b].

There has been a fair amount of recent literature on the topic. I cannot give a complete survey, but the reader may like to consult Chapters IV-V of [9], p. 86 of [8], Chapters VII-VIII of [10], and pp. 333-336 of [11].

Kit Fine: annotated bibliography. Papers 1982-1998

Papers 1982-1998

1. Fine, Kit. 1982. "The Problem of Non-Existents. I: Internalism." *Topoi* no. 1:97-140.

   Contents: A. Iintroduction. 1. Outline 97; 2. Methodology 99; B. Preliminaries, 1. Contexts and Objects 101; 2. Identity and Being 102; 3. The Identity of Non-existents 104; c. An Internalist Theory. 1. The Rudiments 106; 2. The Extended Theory 108; D. Refinements. 1. Implicit /Explicit Copula 110; 2. Diagonal Difficulties 115; 3. Dual Diagonal Difficulties 120; 4. Correlates 123; 5. Modal Matters 129; E. Criticisms. 1. Against Platonism 130; 2. Against Internalism 132; 3. Other Theories 136; Notes 137; References 139.

   "The main philosophical question about non-existents is whether there really are any. My own view is that there are none. But even if this is granted, we may still ask what they are like, just as the materialist may consider the nature of sensations or the nominalist the nature of numbers.

   On this further topic, there seem to be three main divisions of thought, which may be respectively labelled as:

   (i) platonism /empiricism;

   (ii) literalism /contextualism;

   (iii) internalism / externalism.

Let me attempt a rough characterization of these divisions. More refined formulations will come later. On a platonic conception, the non-existent objects of fiction, perception, belief and the like do not depend for their being upon human activity or upon any empirical conditions at all; they exist, or have being, necessarily.

Under an empirical conception, on the other hand, these objects are firmly rooted in empirical reality; they exist, or have being, contingently. On an extreme conception of this sort, these objects are literally created and are brought into being by the appropriate activity either of or within the agent.

(...)

All in all, the three divisions provide for 8 (= 2^3) combinations of positions. Each, I think, is coherent, but some are more natural than others. For example it is natural, though not necessary, for the 'platonist' to accept internalism and for the 'empiricist' to accept externalism; for the means by which the objects are individuated will naturally be taken to provide conditions for their existence or being.

My own view on these questions is given by empiricism, contextualism and extemalism, not that this is a common combination in the literature. This view will be defended in the second part of this paper. In the present part, I am concerned to discuss a view that combines internalism with contextualism and platonism; and in the third part, I shall discuss the literalist position, mainly in association with platonism and internalism. I have not attempted systematically to consider all of the possible combinations of position. I have only looked at the more prominent or plausible of the views, though what I say on them should throw light on what is to be said of the others.

The plan of the present part is as follows. In section A2, I discuss general methodological issues facing any philosophical study of nonexistents and, in particular, defend the claim that one can say what they are like without presupposing that there really are any. In section B, I try first to delineate more precisely the subjectmatter of our theories and then to describe

the problems of providing identity and existence conditions with which any such theory should deal. In section C, I give an initial formulation of an internalist theory, which is successively refined in section D. Finally, in section E, I give two major criticisms of the theory as thus developed. A more detailed account of each section is given in the list of contents.

It is of the greatest importance to note that the present part does not contain my own views on the subject. It is only in the last section of this part that the internalist position is criticized, and it is only in the second part of this paper that my own, more positive, views are developed." (pp. 97-99)

2. ———. 1982. "First-Order Modal Theories. III: Facts." *Synthese* no. 53:43-122.

"This paper forms the third part of a series on the development and study of first-order modal theories. It was not originally intended for this issue, but is relevant to Prior's work in two main ways. First, it does not treat modal logic as a mere technical exercise, but attempts to relate it to common philosophical concerns. This was an approach that Prior himself adopted and perhaps did more than anyone else to foster. Secondly, the paper deals with the more specific topic of facts.

This was a matter upon which Prior had definite views and upon which he had written extensively - in relation to the definition of necessity ([25]), the semantics for the modal system *Q* ([26]), and the correspondence theory of truth ([27] and [29]). I have found all of these writings useful and, although I have disagreed with him on several points, the influence of his views on my own should be evident.

It is therefore with respect and affection that I dedicate this paper to his memory.

The paper falls into two main parts, one philosophical and the other technical. Either may be read independently of the other, but both are required for an all-round view. The first part is in two sections. One attempts to show that a modal first-order theory of facts is viable, and the other discusses its principles

and their bearing on various philosophical issues. The second part is in six sections, which fall into three groups. Those of the first group (§§3--4) deal with the modal theory of possible worlds, both in itself and in its application to other subject-matter. Since I regard worlds as very big facts, it is only natural that they should be considered in this paper. The next section (§5) deals with the theory of facts under the anti-objectualist assumption that they contain no individual constituents. The sections of the last group (§§6-8) deal with facts under objectualist assumptions and include a statement of the appropriate objectualist conditions, a proof of their equivalence to the corresponding conditions for propositions, and an account of the resulting theories. It will be helpful, and sometimes essential, to have the earlier parts of the series ([15] and [16]) at hand.

In the technical part of this paper, I have concentrated on the question of finding a correct essentialist theory of facts. As far as I know, very little work has been done in this direction, although there is a start in [46]. On the other hand, there is now a fair amount of material on facts as a subject, not of object-theory, but of semantical metatheory (see [45], [21] and [43], for example). I do not wish to dispute the interest of this material, either for logic or the philosophy of language; but it will not fall within the purview of the paper." (pp. 43-44)

"The purpose of my theory is not to provide a reference for ordinary uses of a *qua-phrase* but to account for the identity of certain olher objects — chairs, tables and the like— to which we clearly do refer.

Qua objects are governed by certain principles; and it is in terms of them that they are best understood.

Existence. The qua object X qua φ exists at a given time (world-time) if and only if x exists and has φ at the given time (world-time);

Identity . (i) Two qua objects are the same only if their bases and glosses are the same, (ii) A qua object is distinct from its basis (or from the basis of its basis, should that be a qua object, and so on).

Inheritance . At any time (world-time) at which a qua object exists, it has those normal properties possessed by its basis." (p. 100)

(...)

"The theory of qua- objects has some other applications worth mentioning. First, the qua objects are very like Aristotle's compounds of matter and form, with the matter corresponding to the basis and the form to the gloss. Aristotle's views, it seems to me, have not been taken seriously enough; many of his more distinctive doctrines have either been forgotten or fallen into disrepute. A modern version of the Aristotelian theory should give us the courage to embrace some of those doctrines and the means to articulate them more clearly.

Secondly, the theory of qua objects is able to throw light on the question of the ground ' for necessary truths." (p. 104)

4. ———. 1983. "The Permutation Principle in Quantificational Logic." *Journal of Philosophical Logic* no. 12:33-37.

"The story goes back to 1940, with the publication of Quine's *Mathematical Logic* [5]. He there presents a system of quantificational logic in which only sentences or closed formulas are theorems."

(...)

"The story now goes to 1963, with the publication of papers by Kripke [2] and Lambert [3]. Kripke was concerned to block the derivation of the Barcan formula or its converse within a quantified version of the modal logic S5. He was able to do this by requiring, as in Quine [6], that only closed formulas be theorems. However, because he wished to dispense with the rule of necessitation and because he also wished to allow for the empty domain, he did not quite take Quine's revised system as the quantificational basis for his modal logic."

(...)

Quite independently, Lambert developed a similar system. Like Kripke, he was concerned to allow for the empty domain; but he also wished to allow for theorems with free variables."

(...)

"As later became clear, Lambert's full system (with identity) is complete for its intended interpretation. But it was then generally assumed that this system without its identity axioms

and the corresponding quantificational part of Kripke's system (which had not been formulated with identity in the first place) were also complete. Indeed, in their paper [4] of 1970, Leblanc and Meyer gave a metalogical investigation of the Lambert fragment in which it was presupposed that Permutation and related principles were derivable; and, in [2], Kripke claimed completeness for his full modal system, which would have entailed completeness for its quantificational fragment. But then, Lambert pointed out, in a letter to Meyer of around 1968-9, the difficulty of deriving Permutation within the identity-free part of his system; and independently, in his paper of 1970 ([7], p. 286, fn. 6), Trew pointed to the related difficulty of deriving Permutation within Kripke's system. The problem of deriving the principle became open and, at least within the world of free logicians, achieved some notoriety.

It now appears that Permutation is not derivable within these systems." (pp. 33-35)

   Reprinted in: Fred Landman, Frank Veltman (eds.), *Varieties of Formal Semantics. Proceedings of the Fourth Amsterdam Colloquium, September 1982,* Dordrecht: Foris Publications, 1984, pp. 123-142.

   "There is the following view. In addition to individual objects, there are arbitrary objects: in addition to individual numbers, arbitrary numbers; in addition to individual men, arbitrary men. With each arbitrary object is associated an appropriate range of individual objects, its values: with each arbitrary number, the range of individual numbers; with each arbitrary man, the range of individual men. An arbitrary object has those properties common to the individual objects in its range. So an arbitrary number is odd or even, an arbitrary man is mortal, since each individual number is odd or even, each individual man is mortal. On the other hand, an arbitrary number fails to be prime, an arbitrary man fails to be a philosopher, since some individual number is not prime, some individual man is not a philosopher.

   Such a view used to be quite common, but has now fallen into complete disrepute. As with so many things, Frege led the way." (p. 55)

   (...)

   "In the face of such united opposition, it might appear rash to defend any form of the theory of arbitrary objects. But that is precisely what I intend to do. Indeed, I would want to claim, not only that a form of the theory is defensible, but also that it is extremely valuable. In application to a wide variety of topics — the logic of generality, the use of variables in mathematics, the role of pronouns in natural language— the theory provides explanations that are as good as those of standard quantification theory, and sometimes better.

   Rather than present the finished theory at the outset, we may see it as the outgrowth of the criticisms that have been directed against its cruder formulations. Each criticism, if not deflected,

will lead to an appropriate change of formulation. The finished form of the theory will then emerge as the cumulative result of these various criticisms; it will be, if you like, the prize that the proponent of the naive view can carry off with him in the contest with his critics. This is not how I myself came to the theory; but it is perhaps the most congenial approach for those who are already sceptical. (pp. 55-56)

6. ———. 1984. "Critical Review of Parsons' ' *Nonexistent Objects* '." *Philosophical Studies* no. 45:95-142.

   Review of: Terence Parsons, *Nonexistent Objects,* New Haven: Yale University Press, 1980.

   "There has recently been a rebellion within the ranks of analytic philosophy. It has come to be appreciated that, in the debate between Russell and Meinong, Russell was perhaps mistaken in his criticisms and Meinong was perhaps correct in his views. As a consequence, an attempt was made to rehabilitate the Meinongian position, to defend it against the most obvious attacks and to develop it in the most plausible ways. T. Parsons was among the first of the contemporary philosophers to make this attempt, (1) and so it is especially appropriate that his views should now be set out in a book.

   I should say, at the outset, that I thoroughly approve of the Meinongian project. As Parsons makes clear (pp. 32— 38), we refer to non-existents in much the same way as we refer to other objects. It is therefore incumbent upon the philosopher to work out the principles by which our discourse concerning such objects is governed. Not that this is necessarily to endorse a realist position towards the objects of the resulting theory. Nominalists and Platonists alike may attempt to set out the principles that govern arithmetical discourse; and it is in the same spirit that the realist or anti-realist may attempt to set out the principles of our fictional discourse.

   Despite my approval of the project, I must admit to some misgivings as to how Parsons has carried it out. These misgivings are of two kinds. There are first some internal criticisms, requiring only change within Parsons' basic

approach. There are then some external criticisms, requiring change to the basic approach.

These criticisms, though, should not be thought to detract from the merits of Parsons' book. It is, in many ways, an admirable contribution to the field.

It gives weight both to the interest and the legitimacy of the Meinongian enterprise; it pinpoints the difficulties which any satisfactory theory must deal with; and in its solution to those difficulties, it sets up a theory with a degree of rigour and systematicity that should serve as a model for years to come. As a well worked-out and accessible contribution to object theory, there is no better book." (pp. 95-96)

7. Fine, Kit, and Mc Carthy, Timothy. 1984. "Truth without Satisfaction." *Journal of Philosophical Logic* no. 13:397-421.

"In his famous paper [7], Tarski gave a definition of truth for a formalized language. Unable to perform a direct recursion on the concept itself, he gave a definition in terms of satisfaction. This makes it natural to ask if such an indirect procedure is necessary or whether a definition of truth can be given without using or somehow invoking the concept of satisfaction.

The question, as it stands, is vague; and later we shall be concerned to make it more precise. But even as it stands, it has an obvious technical interest. The situation that Tarski found

himself in is common in mathematics. We wish to define a certain concept, but unable to perform a direct recursion on the concept itself we perform a recursion on a related concept of which the given concept is a special case. It would therefore be desirable to know when the related concept is necessary, both in the case of truth and in general.

The question may also have some philosophical interest. There is a fundamental difference between the concepts of truth and of satisfaction. The former merely applies to certain linguistic units; the latter connects language to an ontology of objects, typically extra-linguistic. A negative result on defining truth without satisfaction may perhaps constrain formal attempts to implement non-referential conceptions of truth. In the present paper, however, we will not be concerned in detail with the philosophical aspects of our question, although we will from time to time mention some points of contact between our discussion and the philosophical literature.

Interest in our question dates back to Wallace [9]; and the topic was subsequently taken up by Tharp [8] and Kripke [3] (especially Section 10).

We have made our presentation self-contained, though the reader may consult the earlier work for general background and for elucidation of particular points.

The plan of our paper is as follows. Section 1 sets out the general framework in which our question and its cognates are posed. Section 2 solves the questions in case the meta-theory is not required to be finitely axiomatized; and Section 3 gives partial solutions in case finite axiomatizability is required, thereby answering a question of Kripke's [3] and of Tharp's [8].

Finally, Section 4 considers the question under other provisos on the metatheory." (pp. 397-398)

   Reprinted in *Philosopher's Annual,* vol. 8, 1985.

   "This paper is an abridged and simplified version of my monograph *Reasoning with Arbitrary Objects* [4]. It may be read by the diligent as a preparation for the longer work or by the indolent as a substitute for it. But the reader, in either case, may find it helpful to consult the paper, *A Defence of Arbitrary Objects* [3], for general philosophical orientation.

   This paper deals with certain problems in understanding natural deduction and ordinary reasoning. As is well known, there exist in ordinary reasoning certain procedures for arguing to a universal conclusion and from an existential premiss.We may establish that all objects have a given property by showing that an arbitrary object has the property; and having shown that there exists an object with a given property, we feel entitled to give it a name and infer that it has the property." 9. ———. 1985. "Logics Containing K4. Part II." *Journal of Symbolic Logic* no. 50:619-651.

   "The plan of this part is as follows. §1 presents some elementary results on pmorphisms. §2 introduces the logics to be proved complete and §3 the conditions for which they are complete. §4 contains the completeness proof. In §5 we show that there are a continuum of subframe logics, while in §6 we give various alternative characterizations of the subframe logics and extend our results on the finite model property from logics to theories. The final section, §7, gives a general characterization of those of the subframe logics that are compact and gives reasonably practicable methods for determining when a logic is compact and what condition its axioms express.

   I make free use of the material in the first five sections of Part I, and the reader is advised to have that part at hand." (p. 620)

10. ———. 1985. "Plantinga on the Reduction of Possibilist Discourse." In *Alvin Plantinga* , edited by Tomberlin, James and Inwagen, Peter van, 145-186. Dordrecht: Reidel.

    Reprinted in: *Modality and Tense. Philosophical Papers,* as chapter 5, pp. 176-213.

    "Plantinga is what I call a modal actualist. He believes that the idioms of necessity and possibility are to be taken as primitive in preference to talk of possible worlds and that only actuals, as opposed to possibles, are to be granted ontological status. On these two issues, he and I agree.

    The modal actualist faces a challenge. Talk of possible worlds and of possible individuals appears to make perfectly good sense. There seems to be a clear meaning, for example, in the claim that some possible object does not exist. So the modal actualist, once he grants that possibilist discourse makes sense, must somehow give it sense. It is on this question of how such a challenge is to be met that Plantinga and I disagree.

    He favours a reduction of possibilist discourse in which possible worlds and possible individuals give way to propositions and properties, respectively; I favour a reduction

in which reference to possibles becomes a modal manner of reference to actuals. In this paper, I shall attempt to adjudicate between these rival positions.

In the first section, I shall set out the problem of reduction and Plantinga's favoured solution. In the second, I shall present my central criticism of the reduction, viz. that it is question-begging. In the next three sections, I shall consider the related question of whether properties and propositions exist necessarily, first presenting an argument against and then disposing of an argument for their necessary existence. In the final section, I shall present my own reduction and the reasons for preferring it to Plantinga's.

The central theme of this paper is the question of reduction; but it should have a broader significance than such a theme might suggest. Partly this is because other issues, of independent interest, are raised: the connection between existence and predication; the necessary existence of propositions; the Priorian stand on modality. But perhaps more important than this question of particular issues is the question of how the issues are to be approached, of what is to count as a plausible consideration one way or another. Even when I have found myself in agreement with Plantinga on a certain view, I have often also found myself unhappy with the reasons he adduces in its favour. It is in this difference of approach, then, that the paper may also have a broader significance." (pp. 145-146)

    Reprinted in: Alan Ross Anderson, Nuel D. Belnap, Jr., with contributions by J. Michael Dunn ... [et al.], *Entailment: The Logic of Relevance and Necessity,* Princeton: Princeton University Press, 1992 vol. II, pp. 235-262.

    "This paper is a companion piece to my *Incompleteness for Quantified Relevance Logics* . In that earlier paper, I showed that RQ and other systems of quantified relevance logic were not complete for the standard semantics. In the present paper, I provide a semantics with respect to which they are complete." (p. 27)

(...)

"This section is divided into five subsections. The first two lay out the semantics, the third presents the logics, and the last two establish soundness and completeness. A basic knowledge of the semantics for propositional relevance logic is presupposed (see §51). It is conceivable that the methods of the present section might be used to simplify the proofs of incompleteness for the standard semantics; but this is not here investigated." (p. 239 of the reprint)

12. ———. 1989. "Incompleteness for Quantified Relevance Logics." In *Directions in Relevant Logic* , edited by Norman, Jean and Sylvan, Richard, 205-225. Dordrecht: Kluwer.

    Reprinted in: Alan Ross Anderson, Nuel D. Belnap, Jr., with contributions by J. Michael Dunn ... [et al.], *Entailment: The Logic of Relevance and Necessity,* Princeton: Princeton University Press, 1992 vol. II, pp. 235-261.

    "In the early seventies, several logicians developed a semantics for propositional systems of relevance logic.

    (...)

    In the light of this work, it seemed reasonable to extend the completeness results to quantificational systems of relevance logic. But what systems should be chosen? One would like, in the first place, to deal with the systems that already exist in the literature, such as quantified R (RQ) or quantified E (EQ). This, at least, is a debt that we owe to the history of the subject. But one would also like to prove completeness for the quantificational analogues of propositional systems that have already been proved to be complete. These analogues might be obtained from the propositional system by adding a standard quantificational component, consisting of such and such axioms and rules. Such a component might be chosen in terms of its intrinsic plausibility as a quantificational basis. Less arbitrarily, it might be chosen so as to yield a complete system when combined with the minimal propositional system (the one complete under no special conditions on o, R or *). Not

surprisingly, the pre-existing systems turn out to be equivalent to the systems obtained by the other approach.

The construction of the quantificational analogue is not, in fact, as straightforward as this description might suggest; for the extension of the propositional semantics to the quantificational case is not unique. It must be decided whether the domain I of individuals is to be constant or not. If it is not constant, then there are various ways of dealing with nonexistent individuals, individuals that do not belong to the domain of the world or point under consideration. But once these decisions are made, the choice of the quantificational component can be fixed." (p. 205)

13. ———. 1989. "The Problem of *De Re M* odality." In *Themes from Kaplan* , edited by Almog, Joseph, Perry, John and Wettstein, Howard, 197-272. New York: Oxford University Press.

    Reprinted in: *Modality and Tense. Philosophical Papers,* as chapter 2, pp. 40-104.

    "I want now to evaluate Quine's objections to quantified modal logic, dealing first with the metaphysical and then with the logical argument.

    I observed before that the metaphysical argument was operator-specific; for different operators it yields different problems. This observation applies as much to different notions of necessity as it does to notions other than necessity. There is not a single problem of essentialism, but a range of problems, that vary according to the notion of necessity in question.

    There are perhaps four principal notions of necessity for which the problem arises; these are, respectively, the logical, the analytic, the metaphysical, and the natural. Of these, the most important is undoubtedly the problem for the metaphysical notion. Indeed, not only is this problem of great importance in itself, but it is central, in my opinion, to any attempt to understand the nature of metaphysics.

    However, it is not my intention to discuss this problem here. I wish to follow Quine and concentrate my attention on the

logical and semantic modalities." (p. 202)

14. ———. 1989. "The Justification of Negation as Failure." In *Logic, Methodology and Philosophy of Science VIII. Proceedings of the Eighth International Congress of Logic, Methodology and Philosophy of Science, Moscow, 1987* , edited by Fenstad, Jens Erik, Frolov, Ivan and Hilpinen, Risto, 263-301. Amsterdam: North-Holland.

    "Prolog is a logic programming language; it is used to answer queries on the basis of information provided by the programmer. For the most part, the logic employed by Prolog is standard. But it uses a highly unorthodox rule for establishing negative facts. This rule, the so-called rule of negation as failure, allows us to deny a statement on the grounds that a certain attempt to prove it has failed.

    The rule is not classically valid; and therefore the question arises as to how it is to be justified. There are basically three different kinds of justification that have been proposed in the literature. The first is to re-interpret negation to mean something like unprovability. The second is to assume that the program is complete with respect to truths; all truths are derivable. The third is to suppose that the program is complete with respect to conditions; all sufficient conditions for the application of the predicates have been specified.

    My aim in this paper is to evaluate these various proposals and then to make a proposal of my own. I shall argue that the existing proposals all suffer from some defect or another: the first is unable to account for a classical reading of negation; the second delivers too much on programs which employ negation; and the third delivers too little on programs which make no use of negation.

    I shall then argue that my own proposal is able to avoid these difficulties. From one point of view, the proposal is not new; it is merely a form of the second proposal stated above, according to which all truths are derivable. However, the concept of derivability which is appealed to is quite novel; for the assumption that all truths are derivable, may itself be used in

establishing that a given statement is derivable. The assumption has, in other words, a self-referential character.

The proposal has various other features of interest. It provides a natural way of interpreting inductive definitions in which the positive instances of a predicate are allowed to depend upon its negative instances. It sanctions an extension of the rule of negation of failure, under which not only the finite, but also the transfinite, failure of a statement may constitute a ground for its denial. It is capable of variation in the choice of which other assumptions or rules are used in defining the concept of derivability.

(...)

One feature of my exposition is worthy of special note. I have for the most part confined my attention to the sentential case, under which only truth-functional complexity is ever exposed. Such a case is usually regarded as trivial, since most of the interesting features of Prolog depend upon the use of variables. However, in this regard, the rule of negation as failure is an exception. Most of the problems in justifying the rule already arise at the sentential level; and to solve these problems at this level is to have gone a long way towards solving them altogether. There are, however, certain difficulties which are peculiar to the introduction of variables and terms; and these are considered at the end of the paper. It is argued, in particular, that the usual assumptions concerning an ontology of terms are needlessly strong and that an ordinary ontology of individuals can be countenanced in its place." (pp. 263-264)

15. ———. 1990. "Quine on Quantifying In." In *Propositional Attitudes: The Role of Content in Logic, Language and Mind* , edited by Anderson, Anthony and Owens, Joseph, 1-26. Stanford: Center for the Study of Language and Information, Stanford University.

    Reprinted in: *Modality and Tense. Philosophical Papers,* as chapter 3, pp. 105-130.

    "It is my aim in this chapter to evaluate Quine's argument against quantifying into modal contexts, dealing first with the

peculiarly modal considerations and then with the more general logical considerations." (p. 2)

16. ———. 1991. "The Study of Ontology." *Noûs* no. 25:263-294.

    "A constructional ontology is one which serves to construct complexes from simples. The present paper is concerned with the nature and with the study of such ontologies. It attempts to say, in the first place, how they are constituted and by what principles they are governed. But it also attempts to say how their study may lead one to adopt certain positions and to make certain definitions.

    The remarks on the study of ontology are meant to relate to the study of disciplines in general. I am interested in how the study of a discipline gets shaped by the positions which are adopted and the strategies which are pursued. These interact; for the pursuit of certain kinds of strategy will lead to the adoption of certain kinds of position, and the adoption of certain kinds of position will be required by the pursuit of certain kinds of strategy. One therefore needs to understand how they interact.

    Certain subsidiary themes run through the paper, all interrelated in one way or another. One concerns a dialectical conception of modality, one that is determined by what is left open at a given stage of enquiry. Another involves a particular way of expressing modal claims, in terms of certain objects requiring others. Yet a third is an interest in a relativist conception of ontology, according to which no ontology stands out as being correct.

    The paper concludes with a formal appendix, which attempts to make precise much of what can be made precise in the earlier informal part of the paper. Each part has been designed to be read independently of the other, although a proper understanding of either part depends upon reading them both." (p. 263)

17. ———. 1991. "The Identity of Material Objects." In *Topics in Philosophy and Artificial Intelligence* , edited by Albertazzi, Liliana and Poli, Roberto, 33-37. Bozen: Istituto Mitteleuropeo di Cultura.

Papers from the International Summer Schools in Bozen - 1989-1990.

"1. The Problem of Identity

What is a question of identity? Two responses to this meta-question of identity may be distinguished, which I call the *comparative* and the *intrinsic*. On the comparative conception, one answers a question of identity by saying when two objects of a given sort are the same. On the intrinsic conception, one answers a question of identity by saying what objects of a given sort are "in themselves".

The comparative conception goes back to Locke's famous chapter on identity. It was extended by Frege. Very roughly, we may say that Frege extended the application of the comparative conception from the identity of concrete objects to the identity of abstract objects. This conception is the dominant one of today; it informs the work of Strawson, Quine, Wiggins and of others.

The basic idea behind the comparative conception is to make the *what* of identity a *when:* to ask what an object of a given sort is is to ask when objects of that sort are the same. But to ask when two objects are the same invites the trivial answer: when they are the same. We need somehow to distinguish the intended answers to this question.

This can often be done by means of the concept of a *presentation*. I mean to use this term in a suitably abstract sense. Thus a sentence might be regarded as a presentation of a proposition; there is no need for a presentation to be something mental or even for it to be that by which we grasp the object.

An intended answer to an identity question then says when two presentations are presentations of the same object; and it says this in terms which do not presuppose the identity of the objects at issue.

Different questions of identity - e.g. at a time, across time, across worlds - turn on different accounts of how the objects are to be presented.

There is a fundamental criticism to be made of the comparative conception. For it says what kind of "career" the object has, not what kind of object it is that has the career. For example, a transtemporal criterion of identity for material things is compatible with a material thing being (a) a primitive substance, (b) a mereological sum of time-slices, (c) the embodiment of a form, (d) an event, and so on. Similarly, the extensional criterion of identity for sets is compatible with a set being (a) constructive, (b) "exclusive", i.e. determined by its non-members rather than by its members, (c) logical, i.e. determined by a property with the required extension rather than by its members.

What is missing from the comparative conception? I would like to suggest that often what is missing is an account of how the objects of the given kind are generated or analysed. Thus primitive substances are not generated from anything else at all, mereological sums are generated by aggregation, embodiments are generated by a suitable embodiment operator, and so on. In each case, we need to say how (if at all) the object is to be analysed; we need to say what the object is in itself." pp. 33-34.

18. ———. 1992. "Aristotle on Matter." *Mind* no. 101:35-57.

"It is my belief that there is still a great deal to be learnt from Aristotle's views on the nature of substance; and it is my aim in a series of papers, of which this is the first, to make clear what these views are and what it is in them that is of value. (1)

A peculiarity of my approach, compared to current scholarly practice, is the attempt at rigour. I have tried to provide what is in effect a formalization of Aristotle's views. I have, that is to say, attempted to make clear which of his concepts are undefined and which of his claims underived; and I have attempted to show how the remaining concepts are to be defined and the remaining claims to be derived.

I can well understand a traditional scholar being suspicious of such an approach on the grounds that the various parts of Aristotle's thought are either too unclear to be capable of formalization or else are clear enough not to require it.

Since the matter is not one for a priori dispute, I can only ask the scholar to put his suspicions at bay until the details of the case are examined. I then think that it will be found that the attempt at rigour provides a most valuable guide for the study of the text.

I have not tried to deal with all aspects of Aristotle's thought on substance. I have concentrated on those which centre on the concepts of matter, form, part, and change; and I have neglected those which concern the related concepts of predication, function, priority and power. It is to be hoped that the investigation will be rounded out at some later time to include all of the central aspects of his work.

It should also be mentioned that my treatment of the text has not been altogether scholarly. Partly this has been a matter of competence, and partly of inclination. I have been more concerned with the broad sweep of Aristotle's views than with exegetical detail; and this has led me to conjecture that he held a certain opinion, not because of direct textual evidence but because it is what his view most naturally requires. Thus the Aristotle I have presented here is much more consistent, definite and complete than the Aristotle of the texts." (p. 35)

(1) This paper is based upon the first two sections of my unpublished paper "Aristotle on Substance" . I should like to thank the members of a seminar I held at UCLA in the winter of 1991, and Frank Lewis in particular, for many helpful discussions on some of the topics of the paper. I am also grateful to Richard Sorabji for valuable remarks on an earlier version of the paper.

19. ———. 1992. "Transparent Grammars." In *Logic from Computer Science. Proceedings of a Workshop held November 13-17, 1989* , edited by Moschovachis, Yiannis N., 129-151. New York: Springer.

"1 . Introdution

'Cat' is a word which occurs in 'cattle', but it does not occur as a word; '1-1-2' is a term which occurs in '1+ 2.3', but it does not occur as a term. All such occurrences of expressions might be

said to be accidental, since they are accidents of how the syntax of the language happens to be realized.

The notion of accidental occurrence is significant in various areas of thought. In logic, it greatly aids the formulation and proof of meta-logical results if it can be assumed that the underlying language contains no accidental occurrences. For example, a subformula can then simply be defined as a formula which occurs within a given formula rather than as an expression which is thrown up by a parsing of that formula. In philosophy, the issue of whether one can quantify into modal contexts has been seen to turn on such questions as to whether the occurrence of '9' in 'necessarily, 9 > 7' is accidental or not; and the absence of accidental occurrence has been regarded as a condition on any " ideal language" . In computer science and in linguistics, the presence of accidental occurrences has an obvious relevance to parsing, since they lead to the danger that a parser might mistake an apparent constituent of the expression to be parsed for a genuine constituent.

Let us say that a language or grammar is transparent if it permits no accidental occurrences. It is the main purpose of the present paper to investigate the conditions under which a context-free grammar is transparent.

It is shown how any accidental occurrence reduces to a certain " primitive" case; and it is shown how such primitive occurrences might be detected.

On the basis of these results on reduction and detection, an effective test for transparency is then given.

The concept of transparency represents a strengthening of the more familiar concept of nonambiguity. Any transparent grammar, at least of a well-behaved sort, is unambiguous, though not every unambiguous grammar is transparent. Moreover, what is required for many purposes is not merely an unambiguous but a transparent grammar. It is therefore significant in this regard that there is an effective test for the stronger property even though there is no effective test for the weaker one.

The plan of the paper is as follows. The first two sections introduce the relevant notions from the theory of context-free grammars. The third section explains the connection between nonambiguity and transparency.

The fourth section establishes the reduction of accidental occurrence to the primitive case. The next three sections deal with the question of detecting the primitive accidental occurrences: a more fully articulated or canonical version of the given grammar is introduced; it is shown how accidental occurrences in the given grammar correspond to certain kinds of expression in the canonical grammar; and a precedence analysis is given of those expressions in the canonical grammar which correspond to the primitive

accidental occurrences in the given grammar. An effective test for transparency is then provided in the final section.

The treatment of transparency in this paper has been very brief. Many of the results can be extended; and I have given a much fuller account in Fine [1]." (pp. 129-130)

"The concept of essence has played an important role in the history and development of philosophy; and in no branch of the discipline is its importance more manifest than in metaphysics.

Its significance for metaphysics is perhaps attributable to two main sources. In the first place, the concept may be used to characterize what the subject, or at least part of it, is about.

For one of the central concerns of metaphysics is with the identity of things, with what they are.

But the metaphysician is not interested in every property of the objects under consideration. In asking 'What is a person?', for example, he does not want to be told that every person has a deep desire to be loved, even if this is in fact the case.

What then distinguishes the properties of interest to him? What is it about a property which makes it bear, in the metaphysically significant sense of the phrase, on what an object is?

It is in answer to this question that appeal is naturally made to the concept of essence. For what appears to distinguish the intended properties is that they are essential to their bearers." (p. 1)

(...)

"It is my aim in this paper to show that the contemporary assimilation of essence to modality is fundamentally misguided and that, as a consequence, the corresponding conception of metaphysics should be given up. It is not my view that the modal account fails to capture anything which might reasonably be called a concept of essence. My point, rather, is that the notion of essence which is of central importance to the metaphysics of identity is not to be understood in modal terms or even to be regarded as extensionally equivalent to a modal notion. The one notion is, if I am right, a highly refined version of the other; it is like a sieve which performs a similar function but with a much finer mesh.

I shall also argue that the traditional assimilation of essence to definition is better suited to the task of explaining what essence is. It may not provide us with an analysis of the concept, but it does provide us with a good model of how the concept works. Thus my overall position is the reverse of the usual one. It sees real definition rather than de re modality as central to our understanding of the concept." (p. 3)

21. ———. 1994. "Compounds and Aggregates." *Noûs* no. 28:137-158.

"Some objects appear to be composed of parts: a quantity of sand of its grains, a throbbing pain of its throbs, a set of its members, and a proposition of its constituents.

There seem to be two fundamentally different ways in which an object can be composed of parts. One is nonstructural in character; the parts just merge. The other is structural; the parts hang together within a structure. Thus of the examples above, the first two, the sand and the pain, are composed from their parts in a nonstructural fashion, while the last two, the set and the proposition, are composed in a structural manner.

The notion of a nonstructural method of composition may be taken to be one which conforms to certain structure-obliterating identity conditions. These are as follows: order and repetition among the composing objects is irrelevant to the result; the composition of a single object is the object itself; and the composition of compositions of objects is the composition of those very objects'. Thus the first of these conditions excludes concatenation as a nonstructural method of composition; while each of the remaining conditions excludes the set-builder (the operation which composes a set from its members).

Let us agree to call any nonstructural method of composition a method of fusion. There is a particular such method, I call it aggregation, which has been very prominent in the literature on part-whole. It may be characterized as a method of composition which conforms to the identity conditions above and which also conforms to the following existence conditions: the aggregate of objects which exist in time exists at exactly those times at which one of the objects exists; and an aggregate of objects which are located in space occupies, at any given time at which it exists, exactly those places which are occupied by one of the objects.

It has often been supposed that aggregation is a legitimate method of composition, that objects may be composed from others in conformity with the conditions set forth above. What has made aggregation so attractive, apart from any intuitive appeal it may have, are two main factors (which will be discussed in more detail later in the paper). The first, and most

important, is the identification of a thing with the content of its spatio-temporal extension. The second is the identification of a thing with the fusion of its time-slices. Both of these forms of identification require that the objects fuse in the manner of aggregation.

It has also often been supposed that aggregation is the only legitimate method of fusion. Part of the appeal of this further position may arise from a general hostility to different methods of composition, whether they be methods of fusion or not. Under the form of nominalism championed by Goodman, for example, there can be no difference in objects without a difference in their parts; and this implies that the same parts cannot, through different methods of composition, yield different wholes.

However, I suspect that many of those who would be open to structural methods of composition would still not be open to distinct nonstructural methods of composition. For it is hard to see, especially given the identification of a thing with its spatio-temporal content, what other methods of fusion there might be; and it is hard to see how there could be alternative conceptions of a fusion, of a whole at the same level as its elements and formed without regard to their order or repetition.

Let us call the extreme position, that there is only one method of composition, mereological monism; let us call the less extreme position, that there is only one method of fusion, fusion monism; and let us call that particular version of fusion monism according to which aggregation is the sole method of fusion aggregation monism.

The main purpose of this paper is to show that the last of these three positions is mistaken. I want to show that there is a method of fusion which is not aggregative, i.e. which does not conform to the characteristic existence conditions for aggregates. However, my attack on this position may be relevant to the two other positions as well. For granted that aggregation is itself a legitimate method of fusion, it follows that fusion monism should be dropped in favour of a pluralist position. And to the extent that the adoption of monism

depended upon a general hostility to structural considerations, the way is then open to the admission of structural methods of composition.

It is also my intention to attack two related forms of monistic doctrine. For just as we can single out the aggregative method of nonstructural composition, so we can single out the aggregative way of being a nonstructural part and the aggregative kind of nonstructural whole. One might then maintain that not only does aggregation constitute the only nonstructural method of composition, but that it also constitutes the only nonstructural way of being a part and the only nonstructural way of being a whole. We therefore have three forms of monism, one with respect to composition, another with respect to part, and a third with respect to whole. As will later become clear, the two further forms of monism aresuccessively weaker than the original; and so their denials might be taken, in mimicry of Quine, to comprise three grades of mereological involvement.

From the discussion of monism will emerge objections to two other prominent doctrines: extensionalism and mereological atomism. According to the first of these, things are the same when their extensions (spatial, spatio-temporal, or modal-spatio-temporal) are the same; and according to the second, parts are prior to their wholes.

For the purposes of attacking the aggregation monist, I have assumed that aggregation is a legitimate method of fusion. Towards the end of the paper, I suggest that there is no such method and propose a form of fusion monism in which some other method of fusion takes the place of aggregation. However, my tentative endorsement of fusion monism is not meant in any way to lend support to a general monist position." (pp. 137-139)

22. ———. 1994. "A Puzzle Concerning Matter and Form." In *Unity, Identity, and Explanation in Aristotle's Metaphysics* , edited by Scaltsas, Theodore, Charles, David and Gill, Mary Louise, 13-40. Oxford: Clarendon Press.

"Montgomery Furth has written (1), "given a suitable pair of individuals ... there is no reason of Aristotelian metaphysics why the very fire and earth that this noon composes Callias and distinguishes him from Socrates could not, by a set of utterly curious chances, twenty years from now compose Socrates ...". He does not specify what these "curious chances" might be. But we may suppose that Socrates eats Callias for his lunch and that, owing to the superiority of Callias' flesh and bone, it is the matter of this which remains in Socrates after the period of twenty years.

That such an exchange of matter is possible is a point on which many Aristotelian scholars could agree. However, I wish to argue that such a case gives rise to a fundamental difficulty; for its possibility runs into conflict with certain basic metaphysical principles which are commonly attributed to him and which would also be commonly accepted.

The problem consequently arises as to how this difficulty is to be resolved. This problem itself may be regarded in two somewhat different lights. On the one hand, it may be regarded as a difficulty for Aristotle. The question then is whether one can find a solution which would be acceptable to him, either in the sense that he would or that he could accept it. On the other hand, it may be regarded as a difficulty for a neo-Aristotelian, i.e. to someone who is sympathetic to the analysis of things into matter and form. The question then is to find a solution, regardless of whether or not it would be acceptable to Aristotle.

For the most part, my concern has been with the exegetical question; and even here, my purposes have been somewhat limited. For I have not attempted to settle on one solution as opposed to another. My aim has been to map out the exegetical space rather than to locate the views of Aristotle within it.

However, it should be mentioned that I count myself a neo-Aristotelian (and, indeed, it was my own commitment to hylomorphism which led me investigate Aristotle' views in the first place). It has therefore been of some importance for me to take the purely metaphysical question into account."(p. 13)

(1) Furth, M. *Transtemporal Stability in Aristotelian Substances* , Journal of Philosophy, 75 (1978), 624-646; reprinted in *Substance, Form, and Psyche: An Aristotelean Metaphysics* , Cambridge University Press: Cambridge, 1988. (note abbreviated).

23. ———. 1995. "The Logic of Essence." *Journal of Philosophical Logic* no. 24:241-273.

    "Central to this paper is a certain distinction. This is the distinction between objects simply having a property and their having that property essentially or by their very nature. Also central to the paper is a certain claim. This is the claim that the notion of essence, of objects essentially having a property, is not to be understood in terms of the notion of necessity.

    The claim is defended in my paper *Essence and Modality* . But the basic idea behind the defence can be given here. Consider Socrates and the singleton set containing him. Now although it is plausible to suppose that the singleton essentially contains the man, it is not plausible to suppose that the man essentially belongs to the singleton. There is nothing in the nature of Socrates which demands that there be any sets, let alone one that contains him. However, the standard accounts of essence in terms of necessity are unable to account for this asymmetry. For under such an account, the singleton essentially containing Socrates will consist in something like its being necessarily the case that the set contains Socrates if the set exists. But if this is true, then it will also be necessarily the case that Socrates belongs to the set if the man exists." (p. 241)

24. ———. 1995. "Part-Whole." In *The Cambridge Companion to Husserl* , edited by Smith, Barry and Smith, David Woodruff, 463-485. Cambridge: Cambridge University Press.

    "Husserl's third *Logical Investigation* is perhaps the most significant treatise on the concept of part to be found in the philosophical literature. (1) In it Husserl attempts to analyze the notion of dependent part, to lay down the principles governing its use, and to relate it to more general considerations concerning the nature of necessity and unity.

He begins his study with the consideration of objects in the psychological sphere. A typical example of the kind of object he has in mind is that of a visual datum, a red patch, let us say, and its various aspects or "moments"- its colour, say, or its extension. He takes each of these moments to be peculiar to the object in question; no other datum, no matter how great its resemblance to the original datum, will have the very same moments. He also takes the moments to be, in a suitably broad sense, part of the given object; they are thought to be actually present in it." (p. 463)

(...)

"My aim in the present essay is to clarify certain formal aspects of Husserl's thought. I have here and there, inserted some critical comments; but my main concern has been to say what the views are, and not to say whether or not they are right. Husserl himself took the formalization of his ideas to be not only possible, but highly desirable. He writes (§24, 484):

a proper working out of the pure theory we here have in mind would have to define all concepts with mathematical exactness and to deduce all theorems by argumenta in forma, i.e., mathematically. . . . That this end can be achieved has been shown by the small beginnings of a purely formal treatment in our present chapter. In any case, the progress from vaguely formed to mathematically exact concepts and theories is here, as everywhere, the precondition for full insight into a priori connections and an inescapable demand of science.

Thus the present paper can be regarded as an attempt to carry though the project that he began." (p. 464)

25. ———. 1995. "The Problem of Mixture." *Pacific Philosophical Quarterly* no. 76:266-369.

    Reprinted in: Frank A. Lewis and Robert Bolton (eds.), *Form, Matter and Mixture in Aristotle,* Oxford: Blackwell, 1996, pp. 82-182.

    "For Aristotle, the everyday world contains three main kinds of things: the elements, the homogeneous mixtures, and the heterogeneous substances. The topic of mixture was vigorously

debated in medieval times (see Maier (1982): 142). But contemporary interest has focused on the objects at the extremes of his ontology -- the elements and the substances -- while the topic of mixture has been relatively neglected. This is unfortunate. For not only is the topic of great interest in its own right, it is also important for a wider understanding of Aristotle's scientific and metaphysical views.

The intrinsic interest of the topic largely arises from the difficulty in seeing how a non-atomistic conception of matter is to be reconciled with a plausible view of mixture. The exegetical interest has perhaps two main sources. The first resides in the special position occupied by mixtures in Aristotle's ontology. For all substances are composed of mixtures; and all elements compose mixtures, in so far as they compose anything at all. Thus the mixtures provide the cushion, as it were, between the elements and the substances; and any account of the role of the elements or of the nature of the substances should deal with the relationship of each to the mixtures.

The other source of exegetical interest lies in the relevance of the topic of mixture to other, more general, topics -- principally, potentiality and change. Just as mixtures occupy a kind of midpoint between the elements and the substances, so mixing occupies a kind of midpoint between accidental and substantial change; and the potentiality of the ingredients in a mixture is one of the more important and problematic forms of potentiality for Aristotle. Thus no exegesis of his views on either change or potentiality can be considered complete unless it takes into account his views on mixture.

We now know that Aristotle's views on mixture are mistaken, and badly mistaken at that. In rejecting atomism he made a critical (though understandable) error; and when one combines the rejection of atomism with the antiquated belief in the four elements, it is easy to conclude that his views are purely of scholarly interest with no real relevance to contemporary concerns. But even though his views may be much further removed from reality than those of modern science, they are much closer in many ways to common sense. In the laboratory

we do not suppose that every part of some butter is butter. But in the kitchen we do; and it is convenient, though erroneous, assumptions of this sort that guide us in our everyday life. This therefore suggests that we treat these views of Aristotle as having their most direct bearing, not on the nature of reality, but on the structure of common sense.

There have been recent attempts in cognitive science to formalize the content of folk or naive physics; such a physics is meant to provide the principles that would enable one to construct a robot that could deal with the everyday world in much the same way as we do. If I am not mistaken, the contemporary interest of Aristotle's scientific views may lie as much in their connection with these developments within cognitive science as it does with the content of the established sciences. I might add that the recent attempt to rehabilitate the notion of capacity by Cartwright (1989) and others also gives a topical interest to Aristotle's general views on capacities and on the way they might compose or interact within a mixture.

The paper is in six sections. In the first, I state the problem with which Aristotle opens his discussion of mixture in *Generation and Corruption* : how is mixture possible? Aristotle thinks he has a solution; and our problem is to understand what that solution is. In the next section, I consider three interpretations of his views on mixture, those of Sharvy (1983), Gill (1989) and Bogen (1995), and find all of them wanting. The main defect with these proposals, from my own point of view, is that they do not take Aristotle's hylomorphic outlook sufficiently seriously. In the third section, I provide a sketch of that outlook and set out the two main accounts of mixture that are in conformity with it, Leveling and Ascent; one places mixture at the same level as the elements, the other at a higher level. The next two sections are the heart of the paper and constitute a sustained argument in favor of Leveling. It is shown how two doctrines -- the doctrines of intermediates and of derived parts -- enable Aristotle to avoid the apparently insuperable difficulties that lie in the way of its acceptance. The final section considers the problem of how mixing, as opposed to mixture, is possible and

argues that Aristotle is also in a position to solve this problem." (pp. 82-83).

26. ———. 1995. "Ontological Dependence." *Proceedings of the Aristotelian Society* no. 95:269-290.

"T'here appears to be a distinctively ontological sense in which one thing may be said to depend upon another. What the one thing is will depend upon the other thing, upon what it is. It is in this sense that one is tempted to say that a set depends upon its members or that a particularized feature, such as a smile, upon the particular in which it is found. For what the set is will depend upon its members; and what the feature is will depend upon the particular that instantiates it. (1)

Granted that there is an intelligible notion of ontological dependence, it would appear to be of great importance to the study of metaphysics. Metaphysics has two main areas of concern: one is with the nature of things, with *what* they are; and the other is with the existence of things, with *whether* they are. Considerations of dependence are relevant to both. For central to the question of the nature of any item is the determination of what it depends upon; and if something is taken to exist, then so must any thing upon which it depends. Indeed, it has often been maintained that it is only those things which do not depend upon anything else that can properly be said to exist at all." (p. 269)

(...)

"But how is the notion of dependence itself to be understood? The idea of what something is, its *identity* or *being* , is notoriously obscure; and the idea of the being of one thing *depending* upon that of another is doubly obscure. A natural suggestion at this point is to take the being of something simply to be its existence. Thus in saying that a set depends upon its members, or a feature upon its instantiator, we are taking the existence of the one to depend upon that of the other. Call this the *existential* construal of dependence. Another natural suggestion is to take the dependence between the beings of the two items, as opposed to the items themselves, to be modal in character. The being of the one will depend upon that of the other in the sense that it is necessary that if the one item has its 'being' then so does the other. Call this the *modal* construal of dependence." (p. 270)

(1) This paper derives from an earlier paper 'Dependent Objects' , that was written in 1982 but remained unpublished. Some of the issues raised are discussed at greater length in Fine [1995b]; and no attempt is here made to settle the methodological, as opposed to the conceptual, issues. I should like to thank Ruth Chang and the members of the Wednesday Group at Oxford for helpful comments.

27. ———. 1995. "Senses of Essence." In *Modality, Morality and Belief. Essays in Honor of Ruth Barcan Marcus* , edited by Sinnott-Armstrong, Walter, 53-73. Cambridge: Cambridge University Press.

"One may distinguish between tbe essential and accidental properties of an object. A property of an object is essential if it must have the property to be what it is; otherwise the property is accidental.

But what exactly is meant by this account? It has been common to give a further explanation in modal terms. A property is taken to be essential when it is necessary that the object have

the property or, alternatively, when it is necessary that it have tbe property if it exist. For reasons that I have already given in my paper “Essence and Modality,” I doubt whether this or any other modal explanation of the notion can succeed. Indeed, I doubt whether there exists any explanation of the notion in fundamentally different terms. But this is not to deny the possibility of further clarification; and it is the aim of the present paper to provide it.

What I shall do is to distinguish some of the closely related ways in which the notion may be understood. This will be important for getting clearer both on which claims can be made with its help and on which concepts can be defined with its help. In particular, we shall see that several different senses of ontological dependence correspond to the different senses of essence. The task is also important for the purpose of developing a logic of essentialist reasoning; for most of the different senses of essence that we distinguish will make a difference to the resulting logic. My main concern in this paper has been with making the distinctions, and not with drawing out their implications; but I hope it is clear from the examples what some of these implications are." (p. 53)

28. Fine, Kit, and Schurz, Gerhard. 1996. "Transfer Theorems for Multimodal Logics." In *Logic and Reality: Essays on the Legacy of Arthur Prior* , edited by Copeland, Jack, 169-214. Oxford: Oxford University Press.

    "Many of the modal logics that have been developed contain two or more modal operators. A notable example is the tense logic of Prior, which contains operators for both the past and the future. A more recent example is the logic of programs, which contains infinitely many operators, one for each program.

    A multimodal logic will have various monomodal fragments; and in the simplest case, it will be the join of these fragments -- there will be no interactive axioms. Our concern in the present chapter is to investigate the question of when certain properties of the monomodal logics transfer to their join. To answer this question, we develop a very general proof method, which allows

us to piece together models for different logics. The resulting theorems provide very general answers to our question, which are positive in most cases, but not in all.

Our investigation is a natural continuation of those begun by Prior.

For he was interested both in the development of multimodal logics and in their relationship to monomodal logics. It is therefore, with a keen sense of his own contribution to the subject that we have pursued the present line of research." (p. 169)

[Note:] Some of the initial ideas behind this chapter were contained in a letter from Fine to Schurz in 1990. The subsequent work has been joint, with Fine writing up sections 1 and 6 and Schurz writing up the rest. The result on strong completeness transfer has been obtained independantly by Valentin Goranko and Solomon Passy; the results on transfer of strong and weak completeness, f.m.p., and of decidability (under the assumption of weak completeness) have 'been obtained independently by Marcus Kracht and Frank Wolter. Our own proof of decidability transfer is based upon ideas in their proof.

29. ———. 1998. "Cantorian Abstraction: A Reconstruction and Defense." *Journal of Philosophy* no. 95:599-634.

"In what follows I shall concentrate on the views of Cantor, though it should be clear how what I say will can be modifed to apply to the views of Dedekind. I have not attempted to capture all of the nuances or tensions in Cantor's thought but merely to develop what I take to be its spirit, or central idea. And in developing this idea, I have been guided more by what the idea itself requires than by Cantor's own writings.

The plan of the paper is as follows. I begin by setting out what appear to be decisive objections to the Cantorian account. I then show how these objections can be overcome by making use of the theory of arbitrary objects developed in my book ' *Reasoning with Arbitrary Objects* ' [Chapter VII. The relevant parts of the theory are outlined in section 2; and the application

to Cantor's account of number is made in section 3. I show, in section 4, how the approach may be extended to order types and to structure types in general. In the final two sections, I first compare the Cantorian approach to abstraction with the standard approaches of von Neumann and Zermelo, on the one side, and of Russell and Frege, on the other; and I then consider to what extent the Cantorian approach is capable of yielding a structuralist conception of number and order type. In a formal appendix, I briefly indicate how the present theory might be formalized within an extension of ZF [Zermelo-Frankel]." (p. 603)

30. ———. 1998. "The Limits of Abstraction." In *The Philosophy of Mathematics Today* , edited by Schirn, Matthias, 503-630. Oxford: Oxford University Press.

    Reprinted in expanded form as *The Limits of Abstraction* , New York: Oxford University Press 2002.

    "This paper has been written more from a sense of curiosity than commitment. I was fortunate enough to attend the Munich Conference on the Philosophy of Mathematics in the Summer of 1993 and to overhear a discussion of recent work on Frege's approach to the foundations of mathematics. This led me to investigate certain technical problems connected with the approach; and these led me, in their turn, to reflect on certain philosophical aspects of the subject. I was concerned to see to what extent a Fregean theory of abstraction could be developed and used as a foundation for mathematics and to place the development of such a theory within a general framework for dealing with questions of abstraction. My conclusions were somewhat mixed: a theory of abstraction could be developed somewhat along the lines that Frege has envisaged; and it could indeed be used as a basis for both arithmetic and analysis. When wedded to a suitable version of the context principle, the theory was capable of accounting for our reference to numbers and other abstract objects. But without the support of the principle, it was not clear that the theory had any great advantage over its rivals. Thus my results would be congenial to someone already committed to the Fregean approach though unconvincing to someone who was not. I therefore present

them in somewhat the same spirit as someone who sends off a message in a bottle. I have no desire to announce my communication to the world; but if someone stumbles across it and finds it to be of interest, I shall be pleased.

The paper is in three parts. The first is devoted to philosophical matters, which help explain the motivation for the subsequent technical work and also its significance. It is centred on three abstracts with which they deal? And to what extent can they provide a foundation for mathematics? The second part proposes and investigates a set of necessary and sufficient conditions for an abstraction principle to be acceptable. The acceptable principles, according to this criterion, are precisely determined and it is shown, in particular, that there is a strongest such principle. The third part attempts to develop a general theory of abstraction within the technical limitations set out by the second part; the theory is equipped with a natural class of models; and it is shown to provide a foundation for both arithmetic and analysis.

The original version of the paper contained a lengthy section on the context principle. But this acquired a life of its own (just as reference does under the principle); and it has therefore been omitted. I hope to be able to present the material elsewhere." (pp. 503-504)

31. ———. 1998. "Mixing Matters." *Ratio* no. 11:278-288.

Reprinted in: David Oderberg, *Form and Matter. Themes in Contemporary Metaphysics,* Oxford: Blackwell. 1999 pp. 65-75.

Abstract: "Aristotle raised a puzzle about the possibility of mixing whose solution is by no means obvious. I here explicate his solution to the puzzle and attempt to make it plausible within the context of his thought. Although we now know that his specific views on mixing were mistaken, his discussion of the topic raises questions concerning the role of capacities and the relationship of part to whole that are still of interest."

"The topic of mixture plays a central role in Aristotle's metaphysics (1). For every concrete substance is composed of

mixtures and underlying every substantial change is a process of mixing.

Thus no understanding of substance or of substantial change is complete without an understanding of mixtures and mixing.

Aristotle's account of mixture may also be of some contemporary interest. For it depends upon a view, still worthy of attention, of how dispositions may conflict.

The main text in which mixture is discussed is chapter I.10 of *Generation and Corruption* . Aristotle there raises two puzzles that purport to show that mixing is impossible.

(1) The present paper is a much abridged version of Fine [95].

Many people have helped me develop the ideas in these two papers; and I am especially indebted to the work of Boguen [95] and Code [95].

Kit Fine: annotated bibliography. Papers 1999-2011

Papers 1999-2011

1. Fine, Kit. 1999. "Things and their Parts." *Midwest Studies in Philosophy* no. 23:61-74.

   "I wish to sketch a theory of the general nature of material things. It is a theory on which I have been working for some time; and what I present here is the merest sketch. Details are slid over, significant questions not raised, and controversial assumptions left undefended. But I hope, all the same, that enough is said to indicate the relevance of the theory to questions concerning the nature of material things and the plausibility of its answers.

   One way into the theory is through consideration of part-whole. Things have parts; and so we are led to consider how they are capable of having the parts that they do. What in their nature accounts for their division into parts? It has often been supposed that we may give an adequate answer to this question by conceiving of a material thing as the material content of a space-time region or as a successive stream of matter. But I believe that there are enormous difficulties with these positions and that, once they are taken into account, we are led to adopt a very different conception of a material thing and of its relationship to its parts.

   Central to the paper is a distinction between two different ways in which one thing can be part of another. It can, in the first place, be apart in a way that is relative to a time. It is in this

way, for example, that a newly installed carburetor is now apart of my car, whereas earlier it was not, or that certain molecules are now parts of my body though later, through the exercise of natural bodily functions, they no longer will be.

In the second place, one object can be a part of another in a way that is not relative to a time. For something that is a part in this way, it is not appropriate to ask when, or for how long, it is a part; it just is a part. It is in such a way that the pants and the jacket, for example, are parts of a suit or various atoms are parts of a water molecule, or two particular pints of milk are parts of a quart of milk, or various time-slices, if there are such things, are parts of a persisting individual." (p. 61)

2. ———. 2000. "Semantics for the Logic of Essence." *Journal of Philosophical Logic* no. 29:543-584.

"In a previous paper ' *The Logic of Essence* ', I presented a system for the logic of essence. In this paper, I present a semantics for a variant of the system and prove it complete with respect to that semantics.

(...)

The basic idea behind the semantics is that a statement should be taken to be true in virtue of the nature of certain objects if it is true in any world compatible with the nature of those objects. We shall make the simplifying assumption that each world is compatible with the nature of all and only those objects that it contains. Thus the condition for a statement to be true in virtue of the nature of certain objects is that it should be true in all those worlds that contain those objects. However, the presence of an object in a world is not taken to guarantee its existence but merely its possibility.

Thus each world will be taken to embody its own 'view' of which objects are possible and which are not.

(...)

The first two sections are devoted to the language of the logic (Section 1) and the system of proof (Section 2). The next section gives the semantics (Section 3). The remaining six sections

develop the completeness proof. The first three (Sections 4–6) provide lemmas crucial to the construction of the canonical model. The next two sections (Sections 7, 8) show how to build up a 'diagram' of the model; and the last section (Section 9) shows how to obtain the model itself. The reader might find it helpful to have the previous paper 'The Logic of Essence' at hand (henceforth abbreviated to 'LE') and also to consult the papers 'Essence and Modality' and 'Senses of Essence' for further explanation of the notion of essence and for general philosophical motivation." (pp. 543-544)

3. ———. 2000. "Neutral Relations." *The Philosophical Review* no. 109:1-33.

   "There is a standard view of relations, held by philosophers and logicians alike, according to which we may meaningfully talk of a relation holding of several objects in a given order. Thus it is supposed that we may meaningfully - indeed, correctly - talk of the relation loves holding of Anthony and Cleopatra or of the relation between holding of New York, Washington, and Boston. But innocuous as this view might appear to be, it cannot be accepted as applying to all relations whatever. For there is an important class of metaphysical and linguistic contexts which call for an alternative conception of relation, one for which the order of the relata plays no role and in which the application of the relation to its relata is achieved by other means.

   My argument for this conclusion will be roughly Hegelian in form (though not at all in content). I begin with a thesis, the standard view on relations, and consider various problems to which it gives rise (§ 1). After considering what is required of a solution to these problems (§ 2), I propose an antithesis, the positionalist view, according to which each relation is taken to be endowed with a given number of argument-places, or positions, in no specified order (§ 3). But this view is beset with certain ontological and substantive problems; and I conclude with a synthesis, the antipositionalist view, which combines the virtues of the two previous accounts (§ 4) and is seen to lead to a distinctive conception of relations (§ 5).

I have largely confined my attention to metaphysical issues; and as a consequence, two important topics have not been pursued.

One is the logic of complex neutral relations; and the other is the role of neutral relations in the interpretation of language (and in our mental representation of reality). However, I hope enough has been said on the metaphysics of the issue to make clear why these topics are of interest and how they might be developed." (pp. 1-2)

4. ———. 2000. "A Counter-Exemple to Locke's Thesis." *The Monist* no. 83:357-361.

"Locke's thesis states that no two things of the same sort can be in the same place at the same time. The thesis has recently received extensive discussion, with some philosophers attempting to find arguments in its favour and others attempting to provide counter-examples.(1) However, neither the arguments nor the counter-examples have been especially convincing;and it is my aim, in this short note, to present what I believe is a more convincing counter-example to the thesis." (p. 357)

(...)

"Many philosophers have thought that no two things can necessarily always coincide even if they are not of the same sort. But if this second example is correct, it shows that things may necessarily coincide even when they are of the same sort. (2)" (p. 361)

(1) The detractors include Hughes [97a, b, c], Shorter[77], and Simons ([85], [87], [97]).The defenders include Wiggins ([68], [75], [80]),Odergard [96] and also, of course, all those who hold that no two things can coincide,whether of the same sort or not.

5. ———. 2001. "The Question of Realism." *Philosopher's Imprint* no. 1:1-30.

Reprinted in Andrea Bottani, Massimiliano Carrara, Pierdaniele Giaretta (eds.) *, Individuals, Essence and Identity. Themes of Analytic Metaphysics* , Dordrecht: Kluwer 2002, pp. 3-48.

"My aim in this paper is to help lay the conceptual and methodological foundations for the study of realism. I come to two main conclusions: first, that there is a primitive metaphysical concept of reality, one that cannot be understood in fundamentally different terms; and second, that questions of what is real are to be settled upon the basis of considerations of *ground* . The two conclusions are somewhat in tension with one

another, for the lack of a definition of the concept of reality would appear to stand in the way of developing a sound methodology for determining its application; and one of my main concerns has been to show how the tension between the two might be resolved.

The paper is in two main parts. In the first, I point to the difficulties in making out a metaphysical conception of reality.

I begin by distinguishing this conception from the ordinary conception of reality (§ 1) and then show how the two leading contenders for the metaphysical conception -- the factual and the irreducible-both appear to resist formulation in other terms. This leads to the quietist challenge, that questions of realism are either meaningless or pointless (§ 4); and the second part of the paper (§§ 5-10) is largely devoted to showing how this challenge might be met. I begin by introducing the notion of ground (§ 5) and then show how it can be used as a basis for resolving questions both of factuality (§§ 6-7) and of irreducibility (§§ 8-9). I conclude with some remarks on the essential unity of these two questions and of the means by which they are to be answered (§ 10)." (pp. 3-4)

6. ———. 2002. "The Varieties of Necessity." In *Conceivability and Possibility* , edited by Gendler, Tamar Szabo and Hawthorne, John, 253-282. New York: Oxford University Press.

   Reprinted in: *Modality and Tense. Philosophical Papers,* as chapter 7, pp. 235-260.

   "Necessity abounds. There are the necessary truths of logic, mathematics and metaphysics, the necessary connections among events in the natural world, the necessary or unconditional principles of ethics, and many other forms of necessary truth or connection. But how much diversity is there to this abundance?

   Are all necessary truths and connections reducible to a single common form of necessity? And if not, then what are the different ways in which a truth might be necessary or a necessary connection might hold?

It is the aim of this paper to show that diversity prevails.

I shall argue that there are three main forms of necessity - the metaphysical, the natural and the normative - and that none of them is reducible to the others or to any other form of necessity. Thus what it is for a necessity or possibility of any of these forms to obtain does not consist in the obtaining of some other form or forms of necessity or possibility.

Although the focus of the paper falls squarely within the philosophy of modality, some of my arguments may be of broader interest. For certain currently fashionable views on scientific essentialism and ethical naturalism entail the collapse of forms of necessity that I would wish to keep distinct. Thus I have found it essential to indicate what it is in these views that I take to be in error; and this has required consideration of questions from within the metaphysics of natural kinds and the epistemology of ethical belief." (p. 253)

7. ———. 2003. "The Problem of Possibilia." In *The Oxford Handbook of Metaphysics* , edited by Loux, Michael J. and Zimmerman, Dean, 161-179. Oxford: Oxford University Press.

   Reprinted in: *Modality and Tense. Philosophical Papers,* as chapter 6, pp. 214-231.

   "Are there, in addition to the various actual objects that make up the world, various possible objects? Are there merely possible people, for example, or merely possible electrons, or even merely possible kinds?

   We certainly talk as if there were such things. Given a particular sperm and egg, I may wonder whether that particular child which would result from their union would have blue eyes.

   But if the sperm and egg are never in fact brought together, then there is no actual object that my thought is about.(1) Or again, in the semantics for modal logic we presuppose an ontology of possibilia twice over.(2) For first, we coutenance various possible worlds, in addition to the actual world; and second, each of these worlds is taken to be endowed with its own domain of objects. These will be the actual objects of the world in question, but they need not be actual simpliciter, i.e.,

actual objects of *our* world. What are we to make of such discourse? There are four options:

(i) the discourse is taken to be unintelligible; (ii) it is taken to be intelligible but nonfactual, i.e. as not in the business of stating facts; (iii) it is taken to be factual but reducible to discourse involving no reference to possibilia; (iv) it is taken to be both factual and irreducible.(3) These options range from a fullblooded form of actualism at one extreme to a full-blooded form of possibilism at the other. The two intermediate positions are possibilist in that they accept the intelligibility of possibilist discourse but actualist in that they attempt to dispense with its prima facie commitment to possibilia. All four positions have found advocates in the literature. Quine, in his less irenic moments, favours option (i); Forbes ([85], p. 94) advocates option (ii), at least for certain parts of possibilist discourse; many philosophers, including Adams [74] and myself, opt for (iii); while Lewis [86] and Stalnaker [75] have endorsed versions of (iv), that differ in how full-blooded they take the possible objects to be.

My focus in the present article is on the third option. I wish to see to what extent reference to possibilia might be understood in other terms. Can we regard talk of possibilia as a mere facon de parler, perhaps somewhat in the same manner as talk of the average man or of infinitesimals? (4) I shall not be concerned to argue directly against any of the other options.

However, any argument for the viability of (iii) is indirectly an argument against the plausibility of these other options.

For (iv), especially in its more extreme forms, offends against what Russell has called our 'robust sense of reality', (i) offends against our even more robust sense of what is intelligible, while (ii) offends against our somewhat less robust sense of what is factual. It is therefore preferable to go with the third option, if we possibly can." (pp. 161-162)

(1) Cf Gupta ([80], 20, n.15.

(2) See Kripke [63] for a standard exposition of the semantics.

(3) See Fine [01] for a general discussion of what these various options amount to.

(4) As should be clear from Fine [01], the viability of any reduction will also depend upon its success in accounting for our understanding of modal discourse and our knowledge of modal

truth. See Peacocke [01] for a broader discussion along these lines.

8. ———. 2003. "The Role of Variables." *Journal of Philosophy* no. 50:605-631.

Reprinted in the *Philosopher's Annual* 2003; revised in Joseph Almog, Paolo Leonardi (eds.), *The Philosophy of David Kaplan,* New York: Oxford University Press, 2009 pp. 109-133.

"It is generally supposed - by logicians and philosophers alike - that we now possess a perfectly good understanding of how variables work in the symbolism of logic and mathematics.

Once Gottlob Frege had provided a clear syntactic account of variables and once Alfred Tarski had supplemented this with a rigorous semantic account, it would appear that there was nothing more of any significance to be said. It seems to me, however, that this common view is mistaken. There are deep problems concerning the role of variables that have never been properly recognized, let alone solved, and once we attempt to

solve them we see that they have profound implications not only for our understanding of variables but also for our understanding of other forms of expression and for the general nature of semantics.

It is my aim here to say what these problems are and how they are to be solved, and to indicate the implications fo the rest of semantics. I begin with an antimony concerning the role of variables which I believe any satisfactory account of them should solve (section 1). I then argue that the three main semantical schemes currently on the market - the Tarskian, the instantial and the algebraic -- are unsuccessful in solving the puzzle (sections II-III) or in providing a satisfactory semantics for first-order logic (Sections IV-V). Finally, I offer an alternative scheme that it is capable of solving the antimony (section VI) and of providing a more satisfactory semantics for first-order logic (section VII). It is based upon a new approach to representational semantics, which I call *semantic relationism* ; and I conclude by discussing the implications of this approach for the semantics of names and belief-reports." (p. 605)

9. ———. 2003. "The Non-Identity of a Material Thing and Its Matter." *Mind* no. 112:195-234.

   "Many philosophers have thought that a material thing is, or may be, one and the same as its matter - that a statue, for example, may be the same as the clay from which it is made or a river the same as the water which flows through it. There appears to be a powerful argument against such views, for the thing in each of these cases would appear to have properties not possessed by its matter.

   Thus the clay of a statue may exist even though the statue itself has ceased to exist and the river may be composed of different water at different times even though this cannot be true of the water that composes it at any given time. However, these philosophers have responded to this argument by claiming that the apparent difference in properties represents, not a difference in the objects themselves, but a difference in the descriptions under which they may be conceived. We may

conceive of a given thing as a statue or some clay or as a river or a body of water, for example, and, depending upon how the object is conceived, we will say one thing about it rather than another.

It is the aim of this paper to show that this counter-response cannot be sustained and that the original argument against identity should therefore be allowed to stand. This is no easy task since there would appear to be nothing in the immediate linguistic data to settle the question one way or the other.

However, by working through the consequences of the counter-response for the rest of our language, I think it may be shown to be extremely implausible. The paper is in two main parts. The first (§§1-4) is largely concerned with setting up the problem. We characterize the different forms the identity theory can take (§1), explain how the argument in favor of non-identity might in principle break down (§2), present the most plausible versions of such arguments (§3), and then consider the most plausible counter-response to them (§4). The second part (§§5-8) embarks on a detailed investigation of the difficulties with the counter-response. It is shown to be unable to account for a wide variety of different linguistic data, that is loosely classified according as to how reference to a material thing might be achieved. Four main kinds of case will be considered: those in which a sort is explicitly invoked (§5); those in which it is implicitly invoked (§6); those in which the very notion of reference is itself used in securing reference(§7); and those in which there is reference to a plurality of things (§8)." (p. 195)

10. ———. 2005. "Replies [to Comments on 'Limits of Abstraction']." *Philosophical Studies* no. 122:367-395.

    Replies to critics about *The Limits of Abstraction* .

    "I am extremely grateful to the contributors for their careful, perceptive and sympathetic discussion of my book. For the most part, they have chosen not to criticize what I say but to see how the doctrines of the book might be developed or be used to throw light on other questions. A defense of the book is therefore out of place; and I can do no better than to continue the discussion of some of the questions that they raise. There is

perhaps only one point on which there is a substantive disagreement; and this concerns the status of second-order logic. Weir takes it to be epistemologically problematic; I do not. This issue was not discussed in the book, and I have here attempted to explain the grounds upon which I think its epistemic innocence might be defended." (p. 367)

11. ———. 2005. "Précis [of " *The Limits of Abstraction"*]." *Philosophical Studies* no. 122:305-313.

    Symposium on Kit' Fine's book *The Limits of Abstraction*.

    " Before dealing with the contributors' comments, I would like to provide a selective summary of the book. I will focus on two main themes: the development of a general theory of abstraction; and the critique of Hume's principle as a form of definition. There are several other topics from the book that I would have liked to have covered. They include the question of the identity of abstracts and the viability of the context principle, on the philosophical side (§1.5, §§11.3-5) and the analysis of invariance and the proofs of categoricity, on the technical side (§§6,7). But in the interests of brevity, I have had to exclude them.

    The general idea of abstraction is one that has been discussed by philosophers throughout the ages but it was Frege who first showed how the idea could be put on a rigorous footing. For Frege, the idea of abstraction had two main components. The first related to the items upon which the abstraction was to be performed. These were to be taken to be related by an equivalence relation, i.e. by a relation that was reflexive, symmetric and transitive. As examples, we have the relation of parallelism on lines or the relation of equinumerosity on concepts. The second component related to the abstracts themselves. These were to be obtained from the items by means of a suitable operation of abstraction - the operation of forming directions in the case of parallel lines and of forming numbers in the case of equinumerous concepts. These two components, the equivalence relation and the operation of abstraction, were then to be connected by a principle relating the identity of the

abstracts to the equivalence of the items from which they were formed." (p. 305)

12. ———. 2005. "Class and Membership." *Journal of Philosophy* no. 102:547-572.

    Abstract: "I wish to describe a construction that is capable of yielding a new solution to the set-theoretic paradoxes. Perhaps what is most dis- tinctive about the construction is the reversal in the roles of the predicate of membership and the ontology of sets. On the usual conception of the cumulative hierarchy of Zermelo-Fraenkel set theory (ZF), we think of the membership predicate as given and of the ontology of sets or classes as something to be made out. Thus given an understanding ofmembership, we successively carve out the ontology of sets by using the membership predicate to specify which further sets should be added to those that are already taken to exist. Under the present approach, by contrast, we think of the ontology of classes as given and of the membership predicate as something to be made out. Thus given an understanding of the ontology of classes, we successively carve out extensions of the membership predicate by using conditions on the domain of classes to specify which further membership relationships should obtain. What unfolds is not the ontology of sets or classes but the meaning of membership. This “Copernican revolution” in our conception of class membership, once properly implemented, is capable of yielding a theory of classes that is just as natural as the standard theory of ZF and yet far more powerful in the strength of its principles and the scope of its applications."

13. ———. 2005. "Our Knowledge of Mathematical Objects." In *Oxford Studies in Epistemology. Vol. 1* , edited by Gendler, Tamar Szabo and Hawthorne, John, 89-110. Oxford: Clarendon Press.

    "I have recently been attempting to provide a new approach to the philosophy of mathematics, which I call ‘proceduralism’ or ‘procedural postulationism’.(1) It shares with traditional forms of postulationism, advocated by Hilbert (1930) and Poincaré (1952), the belief that the existence of mathematical objects and the truth of mathematical propositions are to be seen as the

product of postulation. But it takes a very different view of what postulation is. For it takes the postulates from which mathematics is derived to be imperatival, rather than indicative, in form; what are postulated are not propositions true in a given mathematical domain, but procedures for the construction of that domain.

This difference over the status of the posulates has enormous repercussions for the development and significance of such a view. The philosophy of mathematics is faced with certain fundamental problems.

How are we capable of acquiring an understanding of mathematical terms? How do we secure reference to mathematical objects? What is the nature of these objects? Do they exist independently of us or are they somehow the products of our minds? What accounts for the possibility of applying mathematics to the real world? And how are we able of acquire knowledge of mathematical truths? The procedural form of postulationism, in contrast to the propositional form, is capable of providing plausible answers to each of these questions. By going procedural, we convert a view that is beset with pitfalls to one that is worthy of serious consideration.

In what follows I shall focus on the last question concerning our knowledge of mathematics (although this will inevitably involve the other questions). I do this not because this question is the most interesting or even because it provides the most convincing illustration

of the value of our approach, but because it helps to bring out what is most distinctive—and also most problematic—about the approach. If one can go along with what it recommends in this particular case, then one is well on the way to accepting the view in its entirety.

As with the ‘big three’ traditional approaches to the philosophy of mathematics—logicism, formalism, and intuitionism—the present approach rests upon a certain technical program within the foundation of mathematics. It attempts to derive the whole of mathematics—or a significant part thereof—within the

limitations imposed by its underlying philosophy. Since the viability of the underlying philosophical view largely depends upon the possibility of carrying out such a program, it will be helpful to give a sketch—if only in the barest form—of what the program is and of how it is to be executed. I hope elsewhere to provide a much more extensive development of the view in both its philosophical and technical aspects." (pp. 90-90)

    Previously unpublished and written up in the spring of 1984 as a talk for the conference ‘Themes from Kaplan’.

    Chris Peacocke was the commentator.

    "There are three main concerns within current thinking on modality. One relates to the problem of essentialism, of making sense of *de re* modal discourse. Another relates to the problem of transworld identification, of individuating objects across possible worlds. The third relates to the problem of direct reference, of whether any terms can refer to their bearers independently of how they are described.

    It has commonly been supposed that these various problems are connected and that a solution to the one will push us in a certain direction in regard to another. But I shall argue that, once the problems are properly understood, it will be seen that they are quite distinct and that the supposed connections among them are illusory." (p. 19)

15. ———. 2005. "Necessity and Non-existence." In *Modality and Tense. Philosophical Papers* , 321-354. New York: Oxford University Press.

Previously unpublished.

"Is it possible for Socrates to be a man and yet not exist? This is the kind of question that is likely to strike someone from outside philosophy as preposterous and that may not be taken seriously even by philosophers themselves. But I believe that the answer to this question has profound implications for our understanding of the concepts of existence, identity, and modality and for how these concepts connect to one another and to the world.

It is my central contention that, just as there is a distinction between tensed and tenseless sentences, so there is a distinction between worldly and unworldly sentences, between sentences that depend for their truth upon the worldly circumstances and those that do not. It is in terms of such a distinction that we should assess the possibility that Socrates might be a man and yet not exist, since his non-existence will be a matter of the circumstances while his being a man will not. But once the distinction is drawn, it will be seen to have consequences for a wide range of further questions. It will lead us to distinguish, within the realm of what are normally regarded as necessary truths, between the necessary truths proper, those that hold whatever the circumstances, and the transcendent truths, those that hold regardless of the circumstances. It will also lead us to make an analogous distinction, within the realm of what are normally regarded as necessary existents, between the necessary existents proper, those that exist whatever the circumstances, and the transcendent objects, those that exist regardless of the circumstances. Thus some objects will not properly be in the world just as it has been supposed that some objects are not properly in time. Finally, it will be suggested that the identity of an object—what it is—is not, at bottom, a worldly matter; essence will precede existence in the sense that the identity of an object may be fixed by its unworldly features even before any questionof its existence or other worldly features is considered." (p. 321)

16. ———. 2006. "The Reality of Tense." *Synthese* no. 150:399-414.

Expanded version in: *Modality and Tense. Philosophical Papers,* as chapter 8, pp. 261-320.

"Is reality somehow tensed? Or is tense a feature of how we represent reality and not properly a feature of reality itself? Although this question is often raised, it is very hard to say what it comes to. For both sides to the debate can agree to certain tensed claims. They can agree that I am sitting right now, for example, or that Queen Ann is dead. So in a clear and obvious sense there are tensed facts. And so how can it sensibly be denied that reality is tensed?

My own view is that the question can only be made clear by drawing a distinction between how things are (*mere* reality) and how things are in reality (*metaphysical* reality). Thus what the antirealist about tense wishes to dispute is not how things are, which should be common ground between him and his opponent, but how things are in reality. Of course, he will say, Queen Ann is dead but this representation of the facts is not faithful to how things are in reality; and this is so, not because of the reference to Queen Ann or to her being dead, but because of the tense. In a faithful representation of how things are in reality, there will be nothing that corresponds to our use of tense. (1)"

(1) The more formal minded reader may suppose that there is a sentential operator 'in reality,_' by means of which the various realist claims are to be made (Fine 2000). I should add that this paper is a summary of views which are elaborated at much greater length in Fine (2005). In the interests of brevity, I have made no attempt to engage with the extensive literature on the topic.

17. ———. 2006. "Modal Logic and Its Application." *EOLSS Survey of Mathematical Logic* :1-25.

Summary; "Modal logic is a broad and rapidly expanding area of logic with applications to such diverse areas as computer

science, linguistics and philosophy. It deals with the logical behavior of such modal locutions as ‘must’ and ‘might’, ‘was’ and ‘will’, ‘ought’, and ‘may’. It specifies formal languages within which such locutions may be encoded, it lays down axioms and rules by which the locutions are governed, it sets up an interpretation for the resulting symbolism, and it proves various general results concerning the system and its interpretation."

18. ———. 2006. "Arguing for Non-Identity: A Response to King and Frances." *Mind* no. 115:1059-1082.

    "Jeffrey King and Bryan Frances are both critical of my paper, 'The Nonidentity of a Thing and its Matter' (Fine 2003), though in rather different ways. King engages in carpet bombing; his aim is to destroy every argument in sight, even to the extent of showing that the linguistic data cited by the paper favours the monist rather than the pluralist. Frances, by contrast, engages in strategic warfare; by 'taking out' certain key arguments, he attempts to demolish the paper as a whole.

    I remain unmoved -- and, I hope, unscathed -- by their attacks.

    King's carpet bombing may cause a great deal of collateral damage but not to its intended target; and Frances's strategic bombing may hit its target but without inflicting much harm. Still, their papers raise many interesting issues not discussed -- or, at least, not properly discussed -- in my original paper; and I am grateful to them for providing me with the opportunity to take these issues into account.

    My response will be in three main parts: I begin by outlining the central line of argument of my original paper (Sect. 1); I then discuss King's criticisms of the paper (Sects 2, 3, 4); and finally I turn to Frances's criticisms (Sect. 5). I have tried to make my response reasonably self-contained and to bring out the independent significance of the issues under discussion but it would be helpful, all the same, if the reader had all three papers at hand." 19. ———. 2006. "In Defence of Three-Dimensionalism." *Journal of Philosophy* no. 103:699-714.

Reprinted in: Robin Le Poidevin (ed.), *Being: Developments in Contemporary Metaphysics* , Cambridge: Cambridge University Press, 2008, pp. 1-16.

"Let us use the term 'present' in such a way that a material thing can be said to be present both in space and in time. Thus on this usage we can say that the desk in front of me is present at any moment at which it exists and also that it is present at any position within its spatial location at that moment. We might similarly talk of presence throughout a period of time or a region of space and of the presence of other categories of objects, such as states or events.

Some philosophers, the "three-dimensionalists," have thought that there is a distinctive way in which material things are present in time as opposed to space. They have thought that a thing is somehow "stretched out" through its location at a given time though not through the period of during which it exists and that it is somehow present in its entirety at any moment at which it exists though not at any position at which it is located. Other philosophers, the "four dimensionalists," have denied that this was so; they have thought that a material thing is as equally "stretched out" in time as it is in space and that there is no special way in which it is entirely present at a moment rather than at a position.

We might use the term 'existence' for the way in which 3D-ers have thought that a thing is present in time and 'extension' or 'location' for the way in which 4D-ers have thought that a thing is present in space. The 3D-ers have then held that things exist in time but are extended in space while the 4D-ers hold that things are extended both in space and in time. (1)" (p. 699)

(1) My terms 'presence', 'existence', and 'extension' (deriving from my paper, "Compounds and Aggregates," Nous, xxviii, 2 (1994): 137-58) correspond to the more familiar terminology of 'persistence', 'endurance', and 'perdurance'. I prefer my own terminology since it is somewhat more general, allowing one to talk of existence or extension at a moment when one cannot very well talk of endurance or perdurance at a moment and allowing one to talk of existence or extension in space when one cannot very well talk of endurance or perdurance in space.

20. ———. 2006. "Relatively Unrestricted Quantification." In *Absolute Generality* , edited by Rayo, Agustin and Uzquiano, Gabriel, 20-44. New York: Oxford University Press.

"There are four broad grounds upon which the intelligibility of quantification over absolutely everything has been questioned- one based upon the existence of semantic indeterminacy, another on the relativity of ontology to a conceptual scheme, a third upon the necessity of sortal restriction, and the last upon the possibility of indefinite extendibility. The argument from semantic indeterminacy derives from general philosophical considerations concerning our understanding of language. For the Skolem-Lowenheim Theorem appears to show that an understanding of quantification over absolutely everything (assuming a suitably infinite domain) is semantically indistinguishable from the understanding of quantification over something less than absolutely everything; the same first-order sentences are true and even the same first-order conditions will be satisfied by objects from the narrower domain. From this it is then argued that the two kinds of understanding are indistinguishable tout court and that nothing could *count* as having the one kind of understanding as opposed to the other.

The second two arguments reject the bare idea of an object as unintelligible, one taking it to require supplementation by reference to a conceptual scheme and the other taking it to require supplementation by reference to a sort. Thus we cannot properly make sense of quantification over *mere* objects, but only over objects of such and such a conceptual scheme or of such and such a sort. The final argument, from indefinite extendibility, rejects the idea of a *completed* totality. For if we

take ourselves to be quantifying over all objects, or even over all sets, then the reasoning of Russell's paradox can be exploited to demonstrate the possibility of quantifying over a more inclusive domain. The intelligibility of absolutely unrestricted quantification, which should be free from such incompleteness, must therefore be rejected.

The ways in which these arguments attempt to the undermine the intelligibility of absolutely unrestricted quantification are very different; and each calls for extensive discussion in its own right. However, my primary concern in the present paper is with the issue of indefinite extendibility; and I shall only touch upon the other arguments in so far as they bear upon this particular issue. I myself am not persuaded by the other arguments and I suspect that, at the end of day, it is only the final argument that will be seen to carry any real force. If there is a case to be made against absolutely unrestricted quantification, then it will rest here, upon logical considerations of extendibility, rather than upon the nature of understanding or the metaphysics of identity." (pp. 20-21)

21. ———. 2007. "Response to Correia." *Dialectica.International Journal of Philosophy* no. 61:85-88.

    "Correia's paper contains two highly novel and interesting suggestions. The first is to generalize the Priorian perspective so that all that is required for there to be a fact about an object is that there be something that is the object though not necessarily something that exists. The second, building on the first, is to see essence as a form of Priorian implication. There is no doubt that these suggestions help to illuminate the concept of essence, in regard to both its Priorian underpinnings and its connection with modality. But I do not think that they are in tension with the central claims of ' *Essence and Modality* ' and nor do I think that they should lead usto suppose that essentialist statements might be formulated more directly in terms of an 'arrow' rather than a 'box'." (p. 88)

22. ———. 2007. "Response to Garcia-Carpintero." *Dialectica.International Journal of Philosophy* no. 61:191-194.

"I attempted to argue for a supervaluational account of vagueness in an early paper, 'Vagueness, Truth and Logic' (VT&L) and Manuel García-Carpintero is concerned, in his rich and wide-ranging paper, to defend such an account against two objections from M. Andjelkovic and T. Williamson, 'Truth, Falsity and Borderline Cases', *Philosophical Topics* 28, 2000, pp. 211–244. I no longer hold a supervaluational view but am inclined to agree with García-Carpintero that the objections are not successful, though not quite for the reasons that he gives." (p. 191)

23. ———. 2007. "Response to Horwich." *Dialectica.International Journal of Philosophy* no. 61:17-23.

    "In a sustained series of articles and books, Horwich has attempted to deflate the pretensions of philosophy by showing how many of its problems are not problems at all and how many of its 'theories' are explanations of phenomena standing in no need of explanation and, in keeping with this general line of thought, he is concerned, in the present highly interesting and provocative paper, to show how even the modest aims of ' *The Question of Realism* ' go too far in attempting to breathe some life into realist disputes. He is concerned to argue, in particular, that two of the principles that are meant to belong to the common ground between the realist and the antirealist might plausibly be questioned and that the strategy of the paper therefore fails (p. 11)." (p. 17)

24. ———. 2007. "Response to Koslicki." *Dialectica.International Journal of Philosophy* no. 61:161-166.

    "Koslicki's paper is an extraordinarily perceptive and comprehensive discussion of my published work on the nature of material things. Although she is sympathetic to my criticisms of the standard mereological approaches to this topic, she is not so happy with my positive views. She has three main objections in all, which shesummarizes as follows:

    Fine's theory gives rise, first, to a proliferation of primitive sui generis relations of parthood and composition, whose characteristics must be imposed on them stipulatively by means of distinct systems of postulates, tailored to the different

domains of objects. Secondly, we noted that, given its 'superabundance' of objects, Fine's theory is committed to its very own population of 'monsters'. Thirdly, once rigid embodiments are abandoned, the explicitly mereological aspect of Fine's hylomorphic theory is preserved only at the cost of abandoning the Weak Supplementation Principle. This, in turn, along with the other formal properties of Fine's system, makes us wonder why one should consider the primitive sui generis operations introduced by Fine's theory to be genuinely mereological at all (pp. 157–158).

Let me briefly consider the first and third of these objections but devote most of my attention to the second." (p. 161)

25. ———. 2007. "Response to MacBride." *Dialectica.International Journal of Philosophy* no. 61:57-62.

"Fraser MacBride's paper is a deep and searching treatment of the topic of neutral relations. He very clearly explains the motivation for wanting a theory of neutral relations, providing much more than my own paper by way of philosophical and historical context, and he subjects the available theories to a number of interesting and difficult challenges. Although he is critical of my own antipositional line, he shows a keen appreciation of the problems it was meant to solve and of the considerations that led me to adopt it.

I should like to take up two main issues from his paper – one concerning the question of symmetric relations and of whether the positionalist can provide an adequate account of them and the other concerning the question of 'solitary' relational states and of whether the anti-positional can provide an adequate account of how their relata are related." (p. 58)

26. ———. 2007. "Response to Weir." *Dialectica.International Journal of Philosophy* no. 61:117-125.

"In a recent paper, 'Our Knowledge of Mathematical Objects' (KMO), I have outlined a new approach to the foundations of mathematics. I call it 'procedural postulationism' and it is based upon the idea that one may lay down procedures for the expansion of a given domain. The ontology of mathematics is

taken to result from the execution of such procedures; and our knowledge of mathematics is to be attained by seeing what would true upon their execution.

Weir has raised some sharp and significant objections to this approach – one concerning the constraints by which postulation is governed, another concerning the ontological neutrality of second-order logic, upon which my approach is based, and a third concerned with my realist construal of the expanded domains.

Let me deal with each in turn." (p. 117)

27. ———. 2008. "Coincidence and Form." *Aristotelian Society.Supplementary Volume* no. 82:101-118.

Paper read at the Kit Fine Day: Ontology Talks, February 11, 2008, Paris.

Abstract. "How can a statue and a piece of alloy be coincident at any time at which they exist and yet differ in their modal properties? I argue that this question demands an answer and that the only plausible answer is one that posits a difference in the form of the two objects."

"Many philosophers are pluralists about material things. They believe that distinct material things may coincide at a time, i.e. that they may occupy the very same spatial region and be constituted by the very same matter at that time. A familiar example is that of an alloy statue and the piece of alloy from which it is made. They are clearly coincident, and they would also appear to be distinct, given that the piece of alloy may exist before the statue is created or after it has been destroyed.

A number of these philosophers also believe that two distinct material things may coincide in a world, i.e. that they may exist at the same times in the world and coincide at each time at which they exist." (p. 101)

(...)

"The account of an object as a given rigid or variable embodiment may be regarded as a *fundamental* account of what the object is, one that itself stands in need of no further

explanation. We may therefore claim, with some plausibility, to have traced the various features and differences of such objects to their source." (p. 116)

28. ———. 2008. "The Impossibility of Vagueness." *Philosophical Perspectives* no. 22:111-136.

    "I wish to present a proof that vagueness is impossible. Of course, vagueness is possible; and so there must be something wrong with the proof. But it is far from clear where the error lies and, indeed, all of the assumptions upon which the proof depends are ones that have commonly been accepted. This suggests that we may have to radically alter our current conception of vagueness if we are to make proper sense of what it is.

    The present investigation was largely motivated by an interest in what one might call the 'global' aspect of vagueness. We may distinguish between the indeterminacy of a predicate in its application to a single case (the local aspect) and in its application to a range of cases (the global aspect). In the first case, it is indeterminate how a predicate, such as a bald, applies in a given case; and, in the second case, it is indeterminate how a predicate applies across a range of cases.

    Given such a distinction, the question arises as to whether one might understand the indeterminacy of a predicate in its application to a range of cases in terms of its indeterminacy in application to a single case; and considered from this point of view, the result can be seen to show that there is no reasonable way in which this might be done." (p. 111)

    (...)

    "I begin by giving an informal presentation of the result and its proof and I then consider the various responses that might be made to the alleged impossibility. Most of these are found wanting; and my own view, which I hint at rather than argue for, is that it is only by giving up on the notion of singlecase indeterminacy, as it is usually conceived, and by modifying the principles of classical logic that one can evade the result and thereby account for the possibility of vagueness. There are two

appendices, one providing a formal presentation and proof of the impossibility theorem and the other giving a counter-example to the theorem under a certain relaxation of its assumptions. The mathematics is not difficult but those solely interested in the philosophical implications of the results should be able to get by without it.

The general line of argument goes back to Wright [1987] and further discussion and developments are to be found in Sainsbury [1990, 1991], Wright [1992], Heck [1993], Edgington [1993], Gomez Torrente [1997, 2002], Graff-Fara [2002, 2004], and Williamson [1997, 2002]. It would be a nice question to discuss how these various arguments relate to one another and to the argument in this paper. I shall not go into this question, but let me observe that my own approach is in a number of ways more general. It relies, for the most part, on weaker assumptions concerning the underlying logic and the logic of definitely and on weaker constraints concerning the behavior of vague terms; and it also provides a more flexible framework within which to develop arguments of this sort." (p. 112)

29. ———. 2009. "The Question of Ontology." In *Metametaphysics: New Essays on the Foundations of Ontology* , edited by Chalmers, David J., Manley, David and Wassermann, Ryan, 157-177. New York: Oxford University Press.

"There are a number of difficulties with the standard quantificational view. They are for the most part familiar but it will be worth spelling them out, if only to make clear how far removed our understanding of the ontological question is from our understanding of their quantificational counterparts. Philosophers may have learned to live with the disconnect between the two, but their tolerance of the situation should not lull us into thinking that it is tolerable." (p. 138)

"This account of our method for settling ontological dispute requires that we have a grasp not only of an absolute conception of reality, of there *being nothing more than …*, but also of a relative conception, of *there being nothing more to … than …* , since it is through our assessment of the relative claims that we attempt to adjudicate the plausibility of the absolute claims. Many philosophers seem to have supposed that our having a good working grasp of such notions depends upon our being able to define them in other terms, so that questions of metaphysics or ontology thereby become questions of semantics or epistemology or total science. I consider this to

be a serious methodological error: upon careful reflection we can see that our intuitive grasp of these notions is a sufficient guide in itself to their proper employment; and the attempt to define these notions in other terms has served merely to distort our understanding of the metaphysical questions and of the methods by which they are to be resolved." (p. 176)

30. ———. 2010. "Towards a Theory of Part." *Journal of Philosophy* no. 107:559-589.

    Paper read at the *Kit Fine Day: Ontology Talks,* Paris, February 11, 2008.

    "My aim in this paper is to outline a general framework for dealing with questions of partwhole. Familiar as this topic may be, my treatment of it is very different from more conventional approaches. For instead of dealing with the single notion of mereological part or sum, I have attempted to provide a comprehensive and unified account of the different ways in which one object can be a part of another. Thus mereology, as it is usually conceived, becomes a small branch of a much larger subject. (1)

    My discussion has been intentionally restricted in a number of ways. In the first place, my principal concern has been with the notion of absolute rather than relative part. We may talk of one object being a part of another relative to a time or circumstances (as when we say that the tire was once a part of the car or that or that the execution of Marie Antoinette was as a matter of contingent fact a part of the French Revolution) or in a way that is not relative to a time or the circumstances (as when we say that this pint of milk is a part of the quart or that the letter ‘c’ is part of the word ‘cat’). Many philosophers have supposed that the two notions are broadly analogous and that what goes for one will tend to go for the other. (2) I believe this view to be mistaken and a source of endless error. But it is not my aim to discuss either the notion of relative part or its connection with the absolute notion. (3)

    In the second place, I have focused on the ‘pure’ theory of part-whole rather than its application to our actual ontology. Once given a theory of part-whole, there arises the question of how it

applies to the objects with which we are already familiar. This question becomes especially delicate and intricate on my own approach since, although we may recognize that such and such a familiar object is a part or whole, it may not be clear, according to the theory, what kind of whole or part it is. But despite the considerable interest of this question, my focus has been on the abstract development of the theory itself and not on its application to ontology.

Finally, I have only provided the merest sketch of the framework (on which I hope say more elsewhere). Many points are not developed and some not even stated. I have, in particular, said relatively little about the technical foundations of the subject, which are mathematically quite distinctive, or about some of the broader philosophical issues to which they give rise. I have given a rough map of the terrain rather than a guided tour, but I hope I have done enough to bring out the interest of the approach and to make clear how a more systematic and philosophically informed account might proceed." (pp. 559-560)

(1) The material outlined in this paper has been developed over a period of thirty years. It was most recently presented in a seminar at Princeton in 2000; and I am grateful to Cian Dorr, Michael Fara, Gail Harman, Mark Johnston, David Lewis and Gideon Rosen for their comments.

I am also grateful for some comments I received from Ted Sider and two anonymous referees for the journal; and I owe a special debt of thanks to Achille Varzi for his encouragement.

(2) As in T. Sider, *Four Dimensionalism* (Oxford: Clarendon Press, 2001), for example.

(3) The matter is briefly discussed in K. Fine, Things and Their Parts, *Midwest Studies in Philosophy* XXIII (1999), 61-74.

31. ———. 2010. "Some Puzzles of Ground." *Notre Dame Journal of Formal Logic* no. 51:97-118.

"In recent years there has been a growing interest in the concept of ground—of one thing holding in virtue of another, and, in developing an account of ground, a number of

philosophers have laid down principles which they regard as unquestionably true of the concept. (1) The purpose of this note is to show that these principles are in conflict with seemingly impeccable principles of logic. Thus a choice must be made; either one or more of the metaphysical principles or one or more of the logical principles should be given up.

Some philosophers—and especially those already unsympathetic to ground—may think that the conflict reveals some underlying defect in the concept. For if acceptance of the concept of ground has such untoward consequences, then this can only be because the concept was no good in the first place. My own view—which I suggest toward the end of the paper—is quite different. It is not that considerations of ground should be ignored or even that the principles of ground should be given up in the light of their conflict with the principles of logic. Rather we need to achieve some kind of reflective equilibrium between the two sets of principles, one that does justice both to our logical intuitions and to our need for some account of their ground. Thus the conflict, far from serving to undermine the concept of ground, serves to show how important it is to arriving at a satisfactory view of what in logic, as in other areas of thought, can properly be taken to hold.

The puzzle to which the conflict of principles gives rise bears some resemblance to the paradoxes of self-reference. It is not itself a paradox of self-reference: the puzzle, on the one side, makes no direct use of self-reference; the paradox, on the other side, makes no direct appeal to the notion of ground. But considerations of ground are often used to motivate certain solutions to the paradoxes, and the puzzle makes clear the reasoning behind these considerations and brings out the critical role played by the notion of ground. (2)" (pp. 97-98)

(1) They include Audi [1], Batchelor [2], Correia [3], Correia [4], Rosen [10], Schneider [11], and Schneider [12].

(2) I especially have in mind the kind of solution to the semantic paradoxes to be found in Kripke [8].

32. ———. 2010. "Semantic Necessity." In *Modality: Metaphysics, Logic, and Epistemology* , edited by Hale, Bob and Hoffmann, Aviv, 65-80. New York: Oxford University Press.

"In the recent monograph ‘Semantic Relationism’, I made use of a certain notion of what was semantically necessary, or required, in arguing that it might be a semantic requirement that two names were coreferential even though there were no intrinsic semantic features of the names in virtue of which this was so. In the present paper, I wish to consider the bearing of the notion on the nature and content of semantic enquiry. I shall argue that a semantics for a given language is most perspicuously taken to be a body of semantic requirements and that the notion of a semantic requirement should itself be employed in articulating the content of those requirements. There are two main alternatives to this conception to be found in the literature. According to one, a semantics for a given language is taken to be an assignment of semantic values to its

expressions; and according to the other, a semantics for a given language is taken to be a theory of truth for that language. I attempt to show how these alternatives do not provide us with the most perspicuous way of representing the semantic facts and that it is only in terms of our conception that one can properly appreciate what these facts are.

The importance of the notion of metaphysical necessity for metaphysics has long been appreciated, in regard to both explicating the nature of the subject and articulating the content of its claims. If the argument of this paper is correct, then it will help to show that the notion of semantic necessity has a similar and equally important role to play in understanding the nature and content of semantics." (p. 65)

33. ———. 2010. "Comments on Scott Soames' 'Coordination Problems'." *Philosophy and Phenomenological Research* no. 81:475-484.

"A major theme of 'Semantic Relationism' was that many of the familiar worries over the substitutivity of names in belief contexts may be resolved by going relational. But Soames, in his interesting and actionpacked paper, has argued that even if the more familiar worries are removed there are variants of them that will remain." (p. 475)

(...)

"So we see that the relationist does have a response to the worry that Soames raises. However, the way relationism comes in is not through embedding the speaker's report in a larger context of belief attributions, as Soames had supposed, but through seeing the speaker's report and the agent's belief as forming a single context, in which relationships of coordination relevant to the truth of the report may then be discerned."(p. 476)

34. ———. 2010. "Reply to Lawlor's 'Varieties of Coreference'." *Philosophy and Phenomenological Research* no. 81:496-501.

"The focus of Krista Lawlor's challenging paper [*] is on cases of confused reference. By way of illustration, she asks us to suppose that 'Wally says of Udo, " He needs a haircut" , and

Zach, thinking to agree, but looking at another person, says, ‘he sure does” (p. 4). Zach is confused, since he takes the person he is looking at to be the same as the person Wally was referring to. This might not be a semantic confusion, which is what I think Lawlor is after, but a straight confusion over the facts.

For Zach’s primary intention may be to refer to the same person as Wally or, alternatively, to the person he is looking at and he may mistakenly believe that these two people are the same. But let us suppose that Zach means to use use ‘he’ indifferently as a pronoun anaphoric on Wally’s original use of ‘he’ and as a pronoun that is deictic on the person he is looking at. We would then have a case of confused reference of the kind Lawlor has in mind." (p. 496)

[* Krista Lawlor, "Varieties of Coreference", *Philosophy and Phenomenological Research* 81, 2010, pp. 485-495.]

35. ———. 2010. "Comments on Paul Hovda’s ‘Semantics as Information About Semantics Values’." *Philosophy and Phenomenological Research* no. 81:511-518.

"In SR [*Semantic Relationism*] (7-9), I posed the ‘antimony of the variable’. How can the pair of variables x, y have a different semantic role from the pair x, x when x has the same semantic role as y? In attempting to solve this antimony, I suggested that we appeal to the idea of the values that are taken, not merely by a single variable, but by a sequence of variables (SR, 23-4).

The semantic role of the two pairs of variables can then be distinguished, since the first pair will take a distinct pair of objects from the domain as values (assuming that the domain contains at least two objects) while the second pair will not.

Hovda’s makes a marvelous alternative suggestion. [*] ‘The basic idea’, he writes (pp. 4-5) ‘is that a variable can refer to anything and must refer to exactly one thing.’ The more usual idea is that a variable actually takes all of the objects in the domain as values (or ‘referents’). My own relational account of variables is an instance of this approach, but with the modification that variables can now take their values simultaneously and not merely singly." (p. 511)

[* Paul Hovda "Semantics as Information About Semantics Values", *Philosophy and Phenomenological Research* 81, 2010, pp. 485-495.]

36. ———. 2011. "Aristotle's Megarian Manoeuvres." *Mind* no. 120:993-1034.

Abstract: "Towards the end of *Theta* 4 of the *Metaphysics* , Aristotle appears to endorse the obviously invalid modal principle that the truth of A will entail the truth of B if the possibility of A entails the possibility of B. I attempt to show how Aristotle's endorsement of the principle can be seen to arise from his accepting a non-standard interpretation of the modal operators and I indicate how the principle and its interpretation are of independent interest, quite apart from their role in understanding Aristotle."

"I begin by considering the different ways in which Aristotle's two principles might be formalized within the framework of propositional modal logic (Sect. 1). I then consider the deductive and semantic consequences of the different ways in which these principles might be formalized, using the apparatus of contemporary modal logic (Sect. 2). It is shown that the difficulties confronting Aristotle are even greater than might have been thought, since the second principle leads to 'modal collapse', the collapse of possibility to actuality, which is something that Aristotle had previously argued explicitly against.

Three recent attempts to get Aristotle 'off the hook' — those of Brennan (1994), Makin (1999 and 2006), and Nortmann (2006) — are considered and found wanting (Sect. 3). I then propose an alternative solution, which rests upon distinguishing between a world as the locus and as the witness of possibilities (Sect. 4). Once the semantics for Aristotle's use of the modalities is understood in this way, it becomes perfectly explicable why he would have wanted to endorse the converse principle and how he can avoid modal collapse. I defend this interpretation of Aristotle against some objections and try to indicate why it is of independent interest (Sect. 5). I conclude

with an attempt to vindicate Aristotle's argument for the first principle (Sect. 6)." (pp. 994-995)

37. ———. 2011. "An Abstract Characterization of the Determinate/Determinable Distinction." *Philosophical Perspectives* no. 25:161-187.

"My aim in this paper is to provide an account of what it is for the world to have a determinate/determinable structure. Patches have colors, people have heights, particles have mass. These are all instances of the determinate/determinable structure, with a given state of the world consisting in something's possessing a determinate (be it a given color or height or mass) from within a given determinable (color, height or mass). But what is it for the world as a whole to possess such a structure?

In the *Tractatus* , Wittgenstein took the atomic propositions, by which the world is to be described, to be completely independent of one another. But he later revised his view (Wittgenstein [1929]) and allowed that the atomic propositions might exhibit the kind of dependence that is characteristic of the way in which different determinants of a given determinable are exclusive of one another. Our question might therefore be put in the form: how in the most abstract terms should we conceive of the post-Tractarian world?" (p. 161)

James Garvey interview Kit Fine.

"We come finally to Fine’s influential views on vagueness and the so-called “sorites” paradox.

The name comes from the Greek word for heap, “soros”. Eubulides, an ancient Greek philosopher with a thing for paradoxes, asked, roughly, when do you go from a few grains of wheat to a heap? One grain doesn’t count, neither do two or three or four, but keep adding grains and, eventually, you’d say that you do have a heap. The trouble is that for a range of borderline cases, we don’t know what to do with the predicate “is a heap”. There are a number of instances in which “This is a heap” is neither true nor false, but how could that be? When I ask Fine about his views on vagueness, he thinks for a very long minute, noticeably brightening as he does so, and finally tells me he’s found an entirely new way to think about vague predicates.

“I can briefly outline my new view, which is very radical.” He goes on, half smiling, “If I’m right almost everyone else is wrong.” I lean in.

“Predicates can be vague. Take a predicate like bald. It’s vague. Perhaps one way of expressing that is that the predicate is not completely determined in its application. Many people have thought that the phenomenon of vagueness is to be understood though borderline cases: what it is for a predicate to be vague is for there to be borderline cases. My view is that this approach to the problem of vagueness is fundamentally misguided. There is no intelligible notion of borderline case which is relevant to the phenomenon of vagueness. We have to achieve an understanding of vagueness in some other way.

(…)

The new thought is that that's a mistake, that the indeterminacy cannot be localised in that way.

We cannot point our finger at any one case.

"It means everyone else has been wrong. It leads to a very different conception of vagueness, the logic of vagueness, how you handle various problems. It leads to a completely new logic. It's something I've been thinking about." (p. 27)

Kit Fine: annotated bibliography. Papers 2012-2022

Papers 2012-2022

1. Fine, Kit. 2012. "What is Metaphysics?" In *Contemporary Aristotelian Metaphysics* , edited by Tahko, Tuomas E., 8-25. Cambridge: Cambridge University Press.

   "There are, I believe, five main features that serve to distinguish traditional metaphysics from other forms of enquiry. These are: the aprioricity of its methods; the generality of its subject-matter; the transparency or `non-opacity' of its concepts; its eidicity or concern with the nature of things; and its role as a foundation for what there is. In claiming that these are distinguishing features, I do not mean to suggest that no other forms of enquiry possess any of them. Rather, in metaphysics these features come together in a single package and it is the package as a whole rather than any of the individual features that serves to distinguish metaphysics from other forms of enquiry.

   It is the aim of this chapter to give an account of these individual features and to explain how they might come together to form a single reasonably unified form of enquiry. I shall begin by giving a rough and ready description of the various features and then go into more detail about what they are and how they are related." (p. 8).

2. ———. 2012. "Guide to Ground." In *Metaphysical Grounding: Understanding the Structure of Reality* edited by Correia,

Fabrice and Schnieder, Benjamin, 37-80. Cambridge: Cambridge University Press.

"A number of philosophers have recently become receptive to the idea that, in addition to scientific or causal explanation, there may be a distinctive kind of metaphysical explanation, in which explanans and explanandum are connected, not through some sort of causal mechanism, but through some constitutive form of determination. I myself have long been sympathetic to this idea of constitutive determination or "ontological ground"; and it is the aim of the present chapter to help put the idea on a firmer footing – to explain how it is to be understood, how it relates to other ideas, and how it might be of use in philosophy. (1)" (p. 37)

(1) A number of other philosophers (they include Audi [forthcoming], Batchelor [2010], Schaffer [2009b], Correia [2005, 2010], Raven [2009], Rosen [2010], Schnieder [2011]) have done related work in defense of the notion; and I have not attempted to make a detailed comparison between their ideas and my own.

I am grateful to the participants at the Boulder conference on dependence and to Neil Tennant for many helpful comments on an earlier draft of the chapter. I should add that, for reasons of space, some of the material in the chapter originally submitted to the volume had been abridged.

3. ———. 2012. "A Difficulty for the Possible Worlds Analysis of Counterfactuals." *Synthese* no. 189:29-57.

"A number of different accounts of counterfactual statements have been proposed in the literature. It has been thought that they should be understood in terms of the closeness of possible worlds, for example, with the counterfactual from A to C being true if all sufficiently close worlds in which A is true are worlds in which C is true or that they should be understood in terms of some notion of cotenability, with the counterfactual from A to B being true if A in conjunction with truths cotenable with A entails C. But a common presupposition of almost all of these accounts is that counterfactual claims should be intensional. If the sentences A and AN or C and CN are necessarily equivalent then the substitution of AN for A or CN for C in the antecedent or consequent of a counterfactual should preserve its truth-value. Thus, under the usual form of the possible worlds account, the truth-value of a counterfactual will simply turn on the possible worlds in which the antecedent and the consequent are true and so the account will be unable to distinguish between the truth-values of counterfactuals whose antecedents or consequents are true in the same possible worlds and hence are necessarily equivalent while, under the entailment-based accounts, the entailments will remain the same under the substitution of necessary equivalents and so the truth-values of the counterfactuals will also remain the same. (1)

It is the aim of this paper to show that no plausible account of counterfactuals should take them to be intensional and that if we are to describe the different kinds of counterfactual scenarios in the way we want and to reason about them in the way we would like, then the assumption of intensionality should be abandoned. Indeed, it is not merely the assumption of 'modal' intensionality that will fail but also the weaker assumption of'logical' or 'classical' intensionality. For the cases we shall consider are ones in which the substitution of AN for A or CN for C should not be permitted, even though they are logical and not merely necessary equivalents." (pp. 29-30)

(1) The present paper expands on material in the first part of Fine, 'Counterfactuals without Possible Worlds', to appear in Journal of Philosophy [2012].

4. ———. 2012. "Counterfactuals Without Possible Worlds." *Journal of Philosophy* no. 109:221-246.

"Ever since the pioneering work of Stalnaker and Lewis (1), it has been customary to provide a semantics for counterfactuals statements in terms of possible worlds. Roughly speaking, the idea is that the counterfactual from A to C should be taken to be true just in case all of the closest worlds in which A is true are worlds in which C is true. Such a semantics is subject to some familiar difficulties - counterfactuals involving impossible antecedents, for example, or counterfactuals involving big changes consequential upon small changes. But it is not clear how seriously to take these difficulties - either because they might be met through some modification in the notion of closeness or because the intuitions on which the cases depend might be challenged or because the cases themselves might be dismissed as peripheral to the central use of the counterfactual construction; and nor has it been clear what a more satisfactory alternative to the possible world semantics might be put in its place." (p. 221)

5. ———. 2012. "Modal Logic and its Applications to the Philosophy of Language." In *The Routledge Companion to Philosophy of Language* , edited by Russell, Gilliam and Graff Fara, Delia 609-623. New York: Routledge.

   "Modal logic is the logic of possibility and necessity and of other such notions. It began, as did logic in general, with Aristotle, in his theory of the 'modal syllogism'; and various notions and principles of modal logic were extensively discussed in the middle ages.

   But the subject only came into its own at the beginning of the twentieth century (see Goldblatt 2005 for an account of its recent history).

   I begin by presenting some basic material on the possible worlds' approach to modal logic and then show how it relates to certain key topics in the philosophy of language.

   For reasons of space, I have had to be very selective and, inevitably, a great deal of interesting material has not been covered." (p. 609)

   (...)

   "7.6 Limitations

   The possible worlds approach to meaning is subject to some well-known limitations. It cannot distinguish, for example, between knowing one necessary truth from knowing another. Or again, it may be permitted that I post the letter but not permitted that I post the letter or post the letter and burn down the post office, even though the two embedded clauses are true in the same possible worlds.

   There is a question of how seriously to take these difficulties. My own view is that they cannot properly be overcome or ignored and that the possible worlds approach, for all of its success, can only be regarded as the first step towards a more adequate account of meaning." (p. 622)

6. ———. 2012. "The Pure Logic of Ground." *The Review of Symbolic Logic* no. 5:1-25.

   "Ground is the relation of one truth holding in virtue of others. This relation is like that of consequence in that a necessary connection must hold between the relata if the relation is to obtain but it differs from consequence in so far as it required that there should also be an explanatory connection between the relata. The grounds must account for what is grounded. Thus even though P is a consequence of P & P, P & P is not a ground for P, since it does not account for the truth of P.

   It is the aim of this paper to develop a semantics and proof theory for the pure logic of ground. The pure logic of ground stands to ground as Gentzen’s structural rules stand to consequence. One prescinds from the internal structure of the propositions under consideration and simply asks what follows from what in virtue of the formal features of the underlying relation. Thus the claim that ground is transitive, that if P is a ground for Q and Q a ground for R then P should be a ground for R, is plausibly regarded as part of the pure logic of ground; but the claim that P is a ground for P & P will be part of the applied as opposed to the pure logic of ground, since it turns on the logical properties of &." (p. 1)

7. ———. 2012. "Mathematics: Discovery or Invention." *Think* no. 11:11-27.

   Abstract: "Mathematics has been the most successful and is the most mature of the sciences. Its first great master work – Euclid's ‘Elements’ – which helped to establish the field and demonstrate the power of its methods, was written about 2400 years ago; and it served as a standard text in the mathematics curriculum well into the twentieth century. By contrast, the first comparable master work of physics – Newton's *Principia* – was written 300 odd years ago. And the juvenile science of biology

only got its first master work – Darwin's 'On the Origin of Species' – a mere 150 years ago. The development of the subject has also been extraordinarily fertile, particularly in the last three centuries, and it is perhaps only in the last century that the other sciences have begun to approach mathematics in the steady accumulation of knowledge that it has been able to offer. There has, moreover, been almost universal agreement on its methods and how they are to be applied. What we require is proof; and, in practice, there is very little disagreement over whether or not we have it. The other sciences, by contrast, tend to get mired in controversy over the significance of this or that experimental finding or over whether one theory is to be preferred to another."

8. ———. 2013. "A Note on Partial Content." *Analysis* no. 73:413-419.

   "Some philosophers have looked for a notion of partial content for which the content of A is in general part of the content of A & B but the content of A v B is not in general part of the content of A. (1) But they have realized that these two requirements are in tension with one another. For A is logically equivalent to (A _ B) & A and so, if the content of (A _ B) is part of the content of (A v B) & A, it should also be part of the content of A.

   There is a related difficulty for allied notions. Thus, one might want A & B to be partially true via A being true though not want A to be partially true via A v B being true (since A v B might be true through B being true, which has nothing to do with A). Or one might want A & B to have at least much truth in it as A even though A does not in general have at least much truth in it as A v B. Or one might want A to confirm A & B but not want A v B to confirm A (since A v B might in its turn be confirmed by B).

   In this note, I show that this difficulty is of a quite general nature and does not simply arise from the desire to have the content of A be part of the content of A & B but not have the content of A v B be part of the content of A." (p. 413)

Comments on Siders' 'Writing the Book

of the World' [*]

"Ted Sider's 'Writing the Book of the World' is a bold and ambitious work, offering original and provocative answers to a wide range of questions within metaphysics and meta-metaphysics. The book is focused on the topic of fundamentality—of what is fundamental and of what it is to be fundamental and, although Sider is largely concerned to develop his own positive views on the topic, he does devote a couple of sections (§§8.1-2) to my views, as laid out in the paper, 'The Question of Realism'. (1) I hope I may therefore be forgiven for devoting my attention to some of the more critical points that he makes in these sections." (p. 725)

10. ———. 2014. "Truth-Maker Semantics for Intuitionistic Logic." *Journal of Philosophical Logic* no. 43:549-577.

Abstract "I propose a new semantics for intuitionistic logic, which is a cross between the construction-oriented semantics of Brouwer-Heyting-Kolmogorov and the condition-oriented semantics of Kripke. The new semantics shows how there might be a common semantical underpinning for intuitionistic and classical logic and how intuitionistic logic might thereby be tied

to a realist conception of the relationship between language and the world."

"I wish to propose a new semantics for intuitionistic logic, which is in some ways a cross between the construction-oriented semantics of Brouwer-Heyting-Kolmogorov (as expounded in [8], for example) and the condition-oriented semantics of Kripke [6]. The new semantics is of some philosophical interest, because it shows how there might be a common semantical underpinning for intuitionistic and classical logic and how intuitionistic logic might thereby be tied to a realist conception of the relationship between language and the world. The new semantics is also of some technical interest; it gives rise to a framework, intermediate between the frameworks of the two other approaches, within which several novel questions and approaches may be pursued.

I begin with a philosophical discussion and conclude with a long technical appendix. In principle, the two can be read independently of one another but it is preferable if the reader first gains a formal and informal understanding of the semantics and then goes back and forth between the philosophical and technical exposition. (1)" (pp. 549-550)

(1) An earlier version of this paper was presented at a conference on truthmakers in Paris, 2011, and at a conference on the philosophy of mathematics in Bucharest, 2012. I should like to thank the participants of these two conferences for helpful comments and also an anonymous referee for the journal. After completing the paper, I learned that Ciardelli's thesis [1] on inquisitive logic contains some related work.

In particular, the system HH of the appendix is similar to the system for inquisitive logic while lemma 22 corresponds to the disjunctive-negative normal form theorem for inquisitive logic. It would be worthwhile to explore the connections between the two approaches in more detail. I should like to thank Ivano Ciardelli for bringing his thesis to my attention and for helpful correspondence.

"I propose a new theory of vagueness. It differs from previous theories in two main respects. First, it treats vagueness as a global rather than local phenomenon, i.e. vagueness always relates to a number of cases rather than a single case. Second, it treats vagueness as a logical rather than a material matter, i.e. vagueness can be expressed by logical means alone without the help of additional vagueness-theoretic primitives. I shall criticize alternative views, develop a logic and semantics for my own view, and explain how it deals with the sorites."

12. ———. 2014. "Recurrence: A Rejoinder." *Philosophical Studies* no. 169:425-428.

"I am grateful to Nathan Salmon (in Salmon [2012]) for being willing to spill so much ink over my monograph on semantic relationism [2007], even if what he has to say is not altogether complimentary. There is a great deal in his criticisms to which I take exception but I wish to focus on one point, what he calls my ‘formal disproof’ of standard Millianism. He believes that ‘the alleged hard result is nearly demonstrably false’ (p. 420) and that the disproof contains a ‘serious error’ (p. 407). Neither claim is correct; and it is the aim of this short note to explain why." (p. 425)

13. ———. 2014. "Permission and Possible Worlds." *Dialectica* no. 68:317-336.

"It is often taken for granted, by philosophers and linguists alike, that one can give an account of the truth-conditions of statements of permission in terms of possible worlds, that it will be permissible to see to it that p just in case p is true in some permissible or ‘deontically accessible’ world. In this paper, I shall argue that if statements of permission are to serve their purpose as a guide to action then no possible worlds account of their truth-conditions can possibly be correct. In a previous paper, I presented a simple argument against the possible worlds account of counterfactuals (The author [2012a], p. 45); and the present paper arose from my seeing that a similar form of argument applied with even greater force against the possible worlds account of statements of permission.

The objection may be briefly and loosely stated as follows. Suppose God has placed infinitely many apples a1, a2, a3, ... in Alternative Eden and tells Eve (for some reason, this is not mentioned in the Bible) :

You may eat infinitely many of the apples a1, a2, a3, ...

What then is Eve permitted to do?

She might initially have thought that she is permitted to eat all of the apples, say, or all but one, or every other apple, and so on. But whatever her other failings, she is not lacking in logical acumen. She realizes that eating infinitely many of the apples a1, a2, a3, ... is logically equivalent to eating infinitely many of the apples a0, a1, a2, a3,..., where a0 happens to be the apple from the Tree of Knowledge in Original Eden and so, she reasons, if the truth of permission claims is preserved under the substitution of logical equivalents, as it should be under a possible worlds account, then God might just as well have said:

You may eat infinitely many of the applies a0, a1, a2, a3, ...

But if God has said this she would have been permitted to eat the Forbidden Fruit in combination with an infinite selection of the other apples; and so she goes ahead and eats the Forbidden Fruit.

Yet clearly, there is nothing in God's initial statement of permission that actually justifies Eve in eating the Forbidden Fruit, as she soon discovers to her dismay." (pp. 317-318)

14. ———. 2015. "Unified Foundations for Essence and Ground." *Journal of the American Philosophical Association* no. 1:296-315.

"There are, I believe, two different kinds of explanation or determination to be found in metaphysics - one of identity, or of what something is, and the other of truth, or of why something is so. One may explain what singleton Socrates is, for example, by saying that it is the set whose sole member is Socrates and one may explain why, or that in virtue of which, singleton Socrates exists by appeal to the existence of Socrates. One might talk, in connection with the first, of essence, of what singleton Socrates essentially is and, in connection with the second, of ground, of what grounds the existence of singleton Socrates. (1)

Of course, explanations of identity and of truth also occur outside of metaphysics, but what is characteristic of their occurrence within metaphysics is the especially tight connection between explanandum and explanans. Being a set whose sole member is Socrates is somehow constitutive of what Socrates is; and Socrates' existing is somehow constitutive of the existence of singleton Socrates. It is perhaps hard to say in general what constitutes a constitutive explanation but it is at least required, in any case of a constitutive explanation, that there should be metaphysically necessary connection between explanandum and explanans. Given that singleton Socrates is essentially a set whose sole member is Socrates, then it is

metaphysically necessary that the set is one whose sole member is Socrates; and given that Socrates existence grounds the existence of singleton Socrates, it will be metaphysically necessary if Socrates exists that his singleton exists." (p. 296)

(...)

"My present view is that the relationship between the two kinds of explanation is much closer than I had originally taken it to be. The decisive step towards achieving the desired rapprochement is to see both kinds of explanation as having a generic, as well as a specific, bearing on the objects with which they deal; they must be allowed to have application to an arbitrary individual of a given kind and not just to specific individuals of that kind. Once this step is taken, the initial disparities between essence and ground disappear and we are able to provide a unified and uniform account of the two notions. I had previously referred to essence and ground as the pillars upon which the edifice of metaphysics rests (Fine [2012], p. 80], but we can now see more clearly how the two notions complement one another in providing support for the very same structure." (p. 297)

(1) I should like to thank the members of audiences at Birmingham, Oxford and Oslo for many helpful comments. The present paper is a companion to my paper 'Identity Criteria and Ground' and the reader may find it helpful, if not essential, to have the other paper at hand. I should note that Correia [2014] attempts to provide unified foundations, of a very different sort, in terms of an underlying notion of factual identity.

There has been a growing literature on essence and ground in the recent philosophical literature. My own work on essence dates back to Fine [1994]; and a useful reference on ground is the anthology of Correia & Schnieder [2012].

15. ———. 2016. "Angellic Content." *Journal of Philosophical Logic* no. 45:199-226.

"In a number of publications dating from 1977, Angell developed various systems of analytic entailment. The intended interpretation of a statement A → B of analytic entailment is that the content of B should be part of the content of A, and a guiding principle behind the understanding of partial content is that the content of A and of B should each be part of the content of A ∧ B but that the content of A ∨ B should not in general be part of the content of either A or B. Thus partial content cannot be understood as classical consequence or even as relevant consequence under its more usual interpretation.

Quite independently of Angell’s work, I had attempted to develop a semantics for partial content in terms of truthmakers. It was taken to be an intuitive requirement on a truthmaker, or verifier, for a given statement that the verifier should be relevant to the truth of the statement and I had thought that one might take the analytic entailment A → B to hold if every verifier for A contained a verifier for B and if every verifier for B was contained in a verifier for A.

I was naturally interested in the resulting logic of entailment.

Much to my surprise, I discovered that the resulting logic coincided with the first degree fragment of Angell's system. Under the proposed account of partial content, his system exactly captures the logic of partial content, once the content of a statement is identified with a suitable set of verifiers."

(...)

"The paper has 10 sections in all. I detail the systems of analytic entailment to be considered (§1). I provide an outline of the truthmaker semantics (§2), give a definition of containment as a relation between contents (§3), and relate containment to the notion of subject-matter (§4). I establish soundness (§5) and then establish completeness by means of disjunctive normal forms (§§6-7). I consider two alternative semantics for the system, one in terms of falsifiers as well as verifiers (§8), and the other in terms of a many-valued logic (§9). I conclude by briefly considering some of the ways in which the system might be extended (§10)."

16. ———. 2016. "Identity Criteria and Ground." *Philosophical Studies* no. 173:1-19.

"Philosophers often look for criteria of identity or think they are not to be found. They may ask for a criterion of identity for sets, for example, or for propositions, or for persons across time, or for individuals across possible worlds. And in response to such requests, they have said such things as: a criterion of identity

for sets is their having the same members; or a criterion of identity for persons across time is their psychological continuity. (1)

But what are these philosophers asking for when they ask for such criteria? I shall argue that the usual way of construing these questions is seriously misguided. I shall also propose an alternative - and, I hope, preferable - way of construing these questions and shall briefly indicate its significance for our more general understanding of metaphysical explanation. In what follows, I shall often use the criteria of identity for sets and for persons as examples. But it is important to bear in mind that they are just that, examples, and that the points I make concerning them are meant to apply, across the board, to all identity criteria." (p. 1)

17. ———. 2016. "Williamson on Fine on Prior on the reduction of Possibilist Discourse." *Canadian Journal of Philosophy* no. 46:548-570.

"Timothy Williamson's *Modal Logic as Metaphysics* (2013; MLM) is a tour de force — comprehensive in its scope, brilliant in its argumentation, and startling in its conclusions. It merits discussion on a wide range of different fronts, but I hope I can be forgiven for focusing on chapter 7 of the book, in which Williamson criticizes my attempt to carry out Prior's project of reducing possibilist discourse to actualist discourse.

My response is in three main parts. I begin by discussing what the reductive project should be. Williamson and I disagree on this question and, although it is not important for the evaluation of my own reductive proposal, it is important for a broader understanding of the metaphysical issues at stake. I then discuss and evaluate Williamson's criticisms of my original reductive proposal. Although I believe that these criticisms can to some extent be met, they point to the need for a more satisfactory and less contentious form of reduction.

Finally, I lay out the new proposed reduction; it is based on the idea of finding a general way of extending a reduction of first-order discourse to higher order discourse." (p. 548)

18. ———. 2017. "The Possibility of Vagueness." *Synthese* no. 194:3699-3725.

    "I wish in this paper to propose a new approach to the topic of vagueness. It is different from the supervaluational approach, which I had previously advocated in Fine (1975), and from almost all other approaches in the literature of which I am aware.(1) There are two principal respects in which it differs from previous approaches: one concerns the global character of vagueness, of how vagueness relates to a whole range of cases and not merely to a single case; the other concerns the logical character of vagueness, of how it is capable of being conveyed by logical means alone. And so let me say a little more about these two features of the view before proceeding to the account itself." (p. 3699)

    (1) The one exception appears to be Zardini (2014), although his view appears to be very different from mine in a number of fundamental respects.

19. ———. 2017. "A Theory of Truthmaker Content I: Conjunction, Disjunction and Negation." *Journal of Philosophical Logic* no. 46:625-674.

    Abstract: "I develop a basic theory of content within the framework of truthmaker semantics and, in the second part, consider some of the applications to subject matter, common content, logical subtraction and ground."

    "The paper is in two parts - the present part dealing with the familiar concepts of conjunction, disjunction and negation and

the subsequent part dealing with the less familiar concepts of subject-matter, common content, logical remainder and ground.

We shall provide an account of the quasi-structural notions of conjunctive and disjunctive part in the present part, but it is only in the second part that the approach will come into its own and its distinctive contribution to the theory of content become most apparent. Each of the two parts begins with an informal exposition of the material and concludes with a technical addendum. In principle, the exposition and addendum could be read independently of the other, though the reader may find it helpful to go back and forth between them." (p. 626)

20. ———. 2017. "A Theory of Truthmaker Content II: Subject-matter, Common Content, Remainder and Ground." *Journal of Philosophical Logic* no. 46:675-702.

    "We continue with the development of the theory of truthmaker content begun in part I, dealing with such 'non-standard' topics as subject matter, common content, logical remainder and ground. This is by no means an exhaustive list of topics that might have been considered but it does provide an indication of the nature and scope of the theory. As before, the paper is divided into an informal exposition and a technical addendum. Both can be read independently of the other but it would be helpful, in either case, to have the first part of the paper at hand." (p. 675)

21. ———. 2017. "Naive Metaphysiscs." *Philosophical Issues. A Supplement to NOÛS* no. 27:98-113.

    "Metaphysics has two central concerns. One is with the nature of things, with what they are like; and the other is with reality, with what there is.

    (...)

    We therefore arrive at a traditional distinction within metaphysics between *ontology* , which is concerned with what there is, and what one might call *metaphysics proper* , which is concerned with the nature of what there is.(2) I wish, in this paper, to argue that this traditional division in the subject-

matter of metaphysics is misguided and the connection between its two branches misconceived and that it should be replaced by a different division of the subject matter — into what I call *naive* and *foundational metaphysics* — and by a different conception of how the two branches are related. If I am right, then a good deal of metaphysical enquiry has labored under a false or unduly limited view of what the questions of metaphysics are and of how they are to be answered and it is only by reconfiguring the metaphysical landscape that we can obtain a proper view of how the subject should be pursued." (p. 98)

(2) I have in mind here a recent tradition within analytic philosophy, perhaps derived from Quine, and not the more historical tradition deriving from Aristotle.

22. ———. 2017. "Truthmaker Semantics." In *A Companion to the Philosophy of Language. Second Edition. Vol. II* , edited by Hale, Bob, Wright, Crispin and Miller, Alexander, 556-577. Malden: Wiley Blackwell.

    "My aim in the present chapter is to explain the basic framework of truthmaker or 'exact' semantics, an approach to semantics that has recently received a growing amount of interest, and then to discuss a number of different applications within philosophy and linguistics." (p. 556)

23. ———. 2017. "Form." *Journal of Philosophy* no. 114:509-535.

    "This paper is a belated sequel to my paper on Cantorian abstraction.(1) In that paper, I attempted to defend Cantor's account of cardinal numbers as sets of units, using a theory of arbitrary objects that I had previously developed to explain what the units were.(2) Of course, no one now adopts Cantor's own account of cardinal number, preferring instead von Neumann's elegant treatment of cardinal numbers as initial ordinals; this may have led some readers—or potential readers —of my earlier paper to dismiss it as being of purely scholarly interest. But as I had already mentioned in the paper on Cantorian abstraction, "the Cantorian theory can be extended to provide a more general theory of types—covering not merely the abstract formal types of mathematics but also the more

concrete types of ordinary and scientific discourse" [p. 602]; in the present paper, I wish to consider the extension of the account to these other kinds of types (or what I now also wish to call *forms*)." (p. 509)

24. ———. 2018. "Compliance and Command I, Categorical imperative." *The Review of Symbolic Logic* :1-25.

"The main aim of this series of papers is to develop a truthmaker semantics for the logic of imperative and deontic sentences. The first part deals with categorical imperative sentences, the second with deontic sentences and their interplay with categorical imperative sentences, and the third part with the interplay between indicative, imperative and deontic sentences and with conditional imperative and deontic sentences in particular. It would be helpful, though not strictly necessary, to have some standard exposition of truthmaker semantics at hand (such as Fine [2015]). I have for the most part been content with informal exposition but the reader may consult the appendix for some technical detail." (p. 1)

25. ———. 2018. "Compliance and Command II, Imperatives and deontics." *The Review of Symbolic Logic* :1-25.

"In this part of the paper, I am interested in providing a semantics and logic for deontic sentences and working out their connection with the previous semantics and logic for imperatives.

(...)

The plan of the paper is as follows. I begin by making some distinctions and stipulations which will be useful in the rest of

the paper (§1); I introduce and explain the key notion of a code of conduct, relative to which deontic formulas are to be be interpreted (§2); I give the clauses for when a deontic formula is true or false relative to a code of conduct (§3) and spell out some of the consequences of these clauses, especially in regard to the contrast with the standard possible worlds semantics for deontic logic (§4); I consider various ways of reformulating the criterion of validity for deontic formulas and point, in particular, to a very close connection between this criterion and the criterion of validity for imperative inference proposed in part I (§5); I consider some of the characteristic inferences that are or fail to be valid (§6) and outline a system of deontic logic within the truthmaker approach (§7); I show how one might deal with the problem of deontic updating within the truthmaker framework (§8); and I conclude with a brief formal appendix.

I assume the reader is familiar with the basic material from part I, including the truthmaker semantics for imperatives and the definition of validity for imperative inference; and it would also be helpful for her to have some knowledge of the standard possible worlds semantics for deontic logic." (p. 1)

26. ———. 2018. "The World of Truthmakers." In *Being Necessary: Themes of Ontology and Modality from the Work of Bob Hale* , edited by Fred-Rivera, Ivette and Leech, Jessica, 36-59. Oxford: Clarendon Press.

"It is a common idea that the full resources of possible worlds semantics are not required to provide an intensional semantics for classical logic. For these purposes, one need only appeal to partial possibilities, or what I shall call ‘states’, as long as one is willing to modify the usual clauses for the connectives or the definition of validity or perhaps both.

Humberstone (1981), Hale (2013), Rumfitt (2015), and Holliday (2015) are among those who have attempted to develop a semantics of this sort; and manifestations of the same idea are to be found within situation semantics and in the more recent work on inquisitive semantics. It is an approach to semantics to which I myself have been attracted, both in earlier

unpublished work and in some recent work on ‘exact’ truthmaking; and, indeed, it was from the attempt to relate ‘exact’ truth-maker semantics to the other semantical approaches that the present work arose." (p. 36, notes omitted)

28. ———. 2019. "Verisimilitude and Truthmaking." *Erkenntnis* no. 86:1239-1276.

Abstract: "I provide and defend a hyper-intensional account of verisimilitude within the truthmaker framework."

"The main aim of this paper is to apply the recently developed framework of truthmaker semantics to the problem of verisimilitude, or likeness to the truth. Some important initial steps in this direction were taken by Gemes (2007); and some further steps have been taken by Yablo (2014, §6.7). My own thinking on the topic is somewhat different from theirs, however, both in its general conception of truthmaker semantics and in the specific application of the semantics to the concept of verisimilitude; and my hope is that these various

accounts, when taken together, will go some way towards demonstrating the general fruitfulness of the approach." (p. 1239, a note omitted)

29. Fine, Kit, and Jago, Mark. 2019. "Logic for Exact Entailment." *The Review of Symbolic Logic* no. 12:536-556.

    Abstract: "An *exact truthmaker* for *A* is a state which, as well as guaranteeing *A* 's truth, is wholly relevant to it. States with parts irrelevant to whether *A* is true do not count as exact truthmakers for *A* .

    Giving semantics in this way produces a very unusual consequence relation, on which conjunctions do not entail their conjuncts. This feature makes the resulting logic highly unusual. In this paper, we set out formal semantics for exact truthmaking and characterise the resulting notion of entailment, showing that it is compact and decidable. We then investigate the effect of various restrictions on the semantics. We also formulate a sequent-style proof system for exact entailment and give soundness and completeness results."

30. Fine, Kit. 2020. "The Identity of Social Groups." *Metaphysics* no. 3:81-91.

    "I am of the opinion, along with a number of other philosophers, that social groups and organizations are of the same general nature as material things: the differences, insofar as they exist, are intra- rather than extra-categorical. Thus if we wish to understand what it is to be a member of a group, or to understand how a group can change its members while remaining the same, or to understand how two groups can have the very same members, then the answers we should give will be essentially the same as the answers we should give to the questions as to what it is to be a constituent of a material thing,

or how a material thing can change its constitution over time, or how two material things can have the very same material constitution.

I have attempted to answer these questions in the case of material things in an earlier paper (Fine 1999). My view, roughly speaking, is that there are three basic operations by which material things may be formed from some underlying matter. One of these is the familiar operation of compounding or fusion, whereby two or more things may combine to form a sum. The other two operations are less familiar and their admission constitutes a fundamental departure from standard mereological doctrine. I call them rigid and variable embodiment. Rigid embodiment is an operation whereby various objects are combined into a whole whose component parts bear certain properties or stand in certain relations to one another. Thus the component parts are not merely fused but integrated into some kind of structured whole. Variable embodiment, on the other hand, is an operation whereby we may form an object that is manifested as different, more particular, objects at different times or in different counterfactual circumstances. The one operation accounts for the constitution of the object at a time, while the other accounts for the actual or possible changes in its constitution." (p. 81, notes omitted)

31. ———. 2020. "Semantics." In *The Routledge Handbook of Metaphysical Grounding* , edited by Raven, Michael J., 501-509. New York: Routledge.

"It has often been supposed that there need only be a modal connection between a truth-maker and the sentence it makes true or that the truth-maker need only be partially relevant to the sentence it makes true, so that the fact that it is raining and windy, for example, would then be a truth-maker for the sentence ‘it is raining or snowing’. It is therefore important to note that the notion of ground gives rise to a quite distinctive notion of truth-making, which requires not merely a modal connection but also a very strong relevant connection.

Truth-making has been used for two quite distinct ends, one metaphysical and the other semantical. By attempting to discern the truth-makers of sentences, it has been thought that we might achieve a better understanding of the world via an understanding of *what* makes the sentences true and also that we might achieve a better understanding of language via an understanding of *how* the sentences are made true." (p. 502, note omitted)

32. ———. 2020. "Yablo on subject-matter." *Philosophical Studies* no. 177:129-171.

    Abstract: "I discuss Yablo's approach to truthmaker semantics and compare it with my own, with special focus on the idea of a proposition being true of or being restricted to some subject-matter, the idea of propositional containment, and the development of an 'incremental' semantics for the conditional. I conclude with some remarks on the relationship between truth-maker approach and the standard possible worlds approach to semantics."

    "I have recently developed a new approach to vagueness and, in this chapter, I wish to show how this approach applies to ontic indeterminacy—or vagueness in the world.

    Although the supervaluational approach, which I previously endorsed in Fine (1975), is often associated with a

representational conception of indeterminacy—vagueness in language or in thought, it is worth noting that I have always been sympathetic to the idea of ontic indeterminacy. Thus in footnote 10 of the earlier paper, I write “Philosophers have been unduly dismissive over intrinsically vague entities.” I am therefore especially pleased that the present approach is not only able to rehabilitate the ontic conception of indeterminacy but to rehabilitate it in such a way as to make it continuous with the more usual representational conception of indeterminacy.(1)" (p. 141)

    "Kroon and McKeown-Green's (K/M) chapter is a careful and thoughtful discussion of my views on a number of issues concerning the nature of ontology. These include: the connection between what I say on the topic in three different, though related, papers—"What is Metaphysics?" (WM), "The Question of Ontology" (QO), and "The Question of Realism" (QR); my objection that standard quantificational accounts are unable to do justice to full ontological commitment; and the concerns I have against skeptical forms of anti-realism which run counter to received nonphilosophical opinion. In what follows, I shall, for reasons of space, focus on the first two of these issues, although the third is of great interest and importance in its own right." (p. 397)

36. ———. 2020. "Comment's on Philip Percival's "Beyond Reality?"." In *Metaphysics, Meaning, and Modality: Themes from Kit Fine* , edited by Dumitru, Mircea, 403-411. New York: Oxford University Press.

    "Percival is interested in what Kierland and Monton (2007: 487) call the "Reality Principle":

(RP) Reality consists, and only consists, in things and how things are.

He is interested in two different ways in which the all-encompassing conception of reality suggested by this principle may be challenged. We may, on the one hand, wish to restrict reality to only some of the things or to only some of the ways in which things are. This is how my reality predicate from QO and my reality operator from QR work; they effect a division within things or within how things are. We may, on the other hand, wish to allow for something beyond the things or how things are and hence beyond reality itself if reality only consists in things and how things are. Percival considers a number of different ways in which each of these two restrictive conceptions of reality might play out and he considers a striking application of the second conception to the case of time: for under a certain restrictive version of presentism, one may wish to claim both that reality consists in present things or how things presently are and that the past is somehow beyond reality as so conceived.

In what follows, I shall simply focus on the application of the second restrictive conception of reality to the case of time, since I think the framework suggested by my RT and TR may help in providing a proper formulation of the view." (p. 403)

37. ———. 2020. "Comments on Joseph Almog’s “One Absolutely Infinite Universe to Rule Them All: Reverse Reflection, Reverse

Metaphysics”." In *Metaphysics, Meaning, and Modality: Themes from Kit Fine* , edited by Dumitru, Mircea, 412-417. New York: Oxford University Press.

"Joseph Almog’s chapter is a daring and dazzling investigation into the nature of the universe, situated within the grand tradition of absolutist metaphysics, but motivated more by the comparison of the absolute with the set-theoretic universe than with God. It is impossible for me to deal adequately with the deep and difficult issues which his chapter raises and so I hope I may be forgiven if I focus on a few remarks he makes in his Appendix on “the Nature versus Concept/Essence of BO and {BO}.”

Some of my comments are relatively minor and serve simply to clear up possible misunderstandings of my position, but others raise substantive and neglected issues concerning the possible “absolutist” source of necessary truth." (p. 412)

38. ———. 2020. "Comments on Alasdair Urquhart’s “Fine on Arbitrary Objects”." In *Metaphysics, Meaning, and Modality: Themes from Kit Fine* , edited by Dumitru, Mircea, 418-422. New York: Oxford University Press.

    "Alasdair Urquhart’s chapter is a wonderful mix of observations on the theory of arbitrary objects, ranging over a number of historical, logical, and philosophical aspects of the theory. I was especially interested in what he had to say about the evolving conception of variables in the history of mathematics and, in the light of my own previous somewhat casual remarks on the topic, I would now like to follow up on his discussion." (p. 418)

39. ———. 2020. "Comments on Gabriel Sandu’s “Indefinites, Skolem Functions, and Arbitrary Objects." In *Metaphysics, Meaning, and Modality: Themes from Kit Fine* , edited by Dumitru, Mircea, 423-428. New York: Oxford University Press.

    "The main focus of my monograph *Reasoning with Arbitrary Objects* (Fine 1985) was on the application of arbitrary objects to systems of natural deduction. But as Sandu points out, I also thought that appeal to arbitrary objects “would be useful for the semantic analysis of both mathematical and ordinary

language.” Although I spent a great deal of effort at the time in working on these further applications, I did not write up my work. I therefore hope it may be helpful if I say a little more on how I intended these applications to proceed. However, I should warn the reader that my thoughts on the topic are still somewhat tentative and underdeveloped and that I have here made no attempt to defend the position or to compare it with any of the many other competing views on the topic." (p. 423)

40. ———. 2020. "Comments on Kathrin Koslicki’s “Essence and Identity”." In *Metaphysics, Meaning, and Modality: Themes from Kit Fine* , edited by Dumitru, Mircea, 429-434. New York: Oxford University Press.

    "Kathrin Koslicki’s chapter is a wonderfully bold and innovative attack on the question of crossworld-identity: Quine thought Aristotelian essentialism was the problem; and she takes Aristotelian hylomorphism to be the solution." (p. 429)

41. ———. 2020. "Comments on Graeme Forbes’s “Fine’s New Semantics of Vagueness”." In *Metaphysics, Meaning, and Modality: Themes from Kit Fine* , edited by Dumitru, Mircea, 435-443. New York: Oxford University Press.

    "Graeme Forbes is well known for his advocacy of a degree-theoretic approach to vagueness, especially in application to questions of identity; and I am grateful to him for casting his expert and critical eye over my own, very different, approach." (p. 435)

42. ———. 2020. "Comments on Steven T. Kuhn’s “Necessary, Transcendental, and Universal Truth”." In *Metaphysics, Meaning, and Modality: Themes from Kit Fine* , edited by Dumitru, Mircea, 444-449. New York: Oxford University Press.

    "I should begin with an apology. In my paper “Necessity and Non-existence” (NN), I made no reference to the importantly related work of Prior in appendix C of Prior 1957 and to the importantly related work of Steven Kuhn in his superb thesis (Kuhn 1977). The oversight was doubly unfortunate in that Prior was my mentor and Kuhn my student; and my only excuse is that, in the haste to prepare my own paper for

publication, I failed to take proper heed to the previous literature, even when it was already known to me.

In NN, I attempted to argue for a distinction between worldly and unworldly sentences, analogous to the distinction between tensed and tenseless sentences. Kuhn is willing to accept the distinction, but he does not like my argument for the distinction and thinks that I mischaracterize the connection between the necessary and the unworldly." (p. 444)

43. ———. 2020. "Comments on Gideon Rosen's "What is Normative Necessity?"." In *Metaphysics, Meaning, and Modality: Themes from Kit Fine* , edited by Dumitru, Mircea, 450-455. New York: Oxford University Press.

    "Gideon Rosen supports the central theses of "Varieties of Necessity" (VN) concerning the distinction between metaphysical and normative necessity and the proper formulation of moral supervenience; and he takes the defense of these theses much further than I did in my own paper and makes the case for them especially vivid and compelling. I was especially impressed by his attempt to find out what might lie behind the distinction between metaphysical and normative necessity and the doctrine of supervenience and to show how the resulting metaphysical view might have significant implications for the epistemology of moral belief.

    In what follows, I would like to draw a further distinction and to work through some of the consequences of this distinction for various of the issues that Rosen raises. Some of the points I make in this regard may be familiar, though not the general context in which they are made." (p. 450)

44. ———. 2020. "Comments on Bob Hale's "The Problem of *de re* Modality"." In *Metaphysics, Meaning, and Modality: Themes*

from Kit Fine , edited by Dumitru, Mircea, 456-460. New York: Oxford University Press.

"There is a great deal in Hale's chapter which I admire and with which I agree. In particular, I would go along with him in drawing a distinction between the syntactic and semantic *de re* , in finding no reasonable basis for modality *de re* within a linguistic conception of modality, and in diagnosing where Quines's argument (or what I would call his "logical" argument) goes wrong. However, in typical philosophical fashion, I shall focus on two points of disagreement, one concerning the problem of accounting for the *de re* form of modality within the linguistic conception, and the other concerning whether Quine should be regarded as having one or two arguments against quantifying into modal contexts." (p. 456)

45. ———. 2020. "Comments on Penelope Mackie's "Can Metaphysical Modality Be Based on Essence?"." In *Metaphysics, Meaning, and Modality: Themes from Kit Fine* , edited by Dumitru, Mircea, 461-465. New York: Oxford University Press.

"Penelope Mackie's chapter raises a serious challenge to the essentialist account of modality." (p. 461)

"I would like to think that in a properly systematic account of first-order metaphysical enquiry we could simply take the notion of necessitist essence as primitive and that nothing would be thereby lost, and something even gained, by defining the other notions in terms of it in the way I have explained. But I have to admit that, for certain—perhaps quite limited—purposes, this point of view may be unduly restrictive and that we should therefore be open to there being independently given notions of neutral essence or metaphysical necessity." (p. 465)

46. ———. 2020. "Comments on Fabrice Correia's "More on the Reduction of Necessity to Essence"." In *Metaphysics, Meaning, and Modality: Themes from Kit Fine* , edited by Dumitru, Mircea, 466-470. New York: Oxford University Press.

"I have long admired Fabrice Correia's work on the conceptual foundations of metaphysics and his present chapter is a

characteristically judicious and original contribution to the subject.

He is principally concerned with certain reductive theses that I propounded in “Essence and Modality” (EM; 1994). These are that a metaphysical necessity is a proposition true in virtue of the nature of all objects, that a conceptual necessity is a proposition true in virtue of the nature of all concepts, and that a logical necessity is a proposition true in virtue of the nature of all logical concepts. Given that there are different notions of what it is for a proposition to be true in virtue of the nature of some objects, Correia’s interest is in what notion or notions of this sort might underwrite these various reductive claims and, to this end, he is prepared in principle to relinquish any other desiderata one might wish to impose upon these notions." (p. 466)

47. ———. 2020. "Comments on Jessica Wilson’s “Essence and Dependence”." In *Metaphysics, Meaning, and Modality: Themes from Kit Fine* , edited by Dumitru, Mircea, 471-475. New York: Oxford University Press.

"Jessica Wilson’s paper is a wonderfully sympathetic account of my general approach to metaphysics; and there is a special satisfaction to be had in being, not merely understood, but understood so well.

(...)

But her paper is not all praise. For she wishes to criticize my account of ontological dependence in terms of essence - perhaps as part of a larger critique of the use of a general notion of dependence in etaphysics (§ 4). In a number of papers, I have suggested that an object x will depend upon an object y if and only y figures in the essence of x, i.e., if and only if, in giving an account of what x is, reference must be made

y. But she thinks that this equivalencemay fail in the right to left direction, that an object y may figure in the essence of x without x depending upon y (she may be perfectly happy with the left to right direction, though this is not something that she discusses)." (p. 471)

48. ———. 2020. "Comments on Scott Shalkowski's "Essence and Nominalism"." In *Metaphysics, Meaning, and Modality: Themes from Kit Fine* , edited by Dumitru, Mircea, 476-481. New York: Oxford University Press.

    "Scott Shalkowski and I share a distaste for the ontological extravagance of modal realism and it is a delight to read him write with such eloquence and passion on the need for "sober metaphysics."

    However, there is a point on which we appear to disagree and this has to do with the formulation and defense of nominalism; and it will perhaps help to illuminate the general doctrines of QR and QO by drawing out the contrast between our different views in this particular case." (p. 476)

    QR = Question of Realism

    QU = Question of Ontology

49. ———. 2020. "Comments on Robert Goldblatt's "Fine's Theorem on First-Order Complete Modal Logics"." In *Metaphysics, Meaning, and Modality: Themes from Kit Fine* , edited by Dumitru, Mircea, 482-484. New York: Oxford University Press.

    "I am grateful to Robert Goldblatt for his lucid and masterly chapter on "canonicity" in modal logic.

    (...)

    I have nothing of a technical interest to add to what Goldblatt writes, but I did think that it might be helpful to say something more about the context in which I pursued some of these early enquiries into the mathematical foundations of modal logic. There is no doubt that the Lemmon Scott notes served as a great stimulus to those of us who were working in the area. Kripke's original completeness proofs in terms of semantic tableaux were inelegant and unwieldy (as pointed out by Kaplan in his review; 1966), and the Lemmon Scott method of canonical models held out the hope of providing a simple and

uniform method of proving completeness for a wide range of modal logics." (p. 482)

"Gary Ostertag’s chapter is an intriguing and probing investigation into the concept of coordination, or *de jure* co-reference, in which he is concerned not only to criticize the views on coordination which I presented in “Semantic Relationism” (SR) but also to develop a view of his own, one in which coordination is not a feature of what we say, but of how we say it.

There are perhaps two main points on which Ostertag takes us to disagree: one concerns whether coordination is syntactic in nature; and the other concerns whether a coordinated sentence expresses a oordinated, as opposed to an uncoordinated, proposition. However, as I read through his chapter, it was hard for me to get a firm sense of where our disagreement lay; and I was inclined to think, at the end of the day, that there was perhaps no real disagreement between us at all." "Paolo Bonardi has written extensively and illuminatingly on direct reference theory, and I am grateful for his present comments on the conceptual foundations of semantic relationism.

Central to the doctrine of semantic relationism is the relation of coordination.

(...)

As I mention in *Semantic Relationism* (p. 40), “other philosophers can acknowledge the phenomenon [of coordination]”; and, indeed, I think that any reasonable view should recognize the distinction between the two kinds of co-reference. What is distinctive about semantic relationism is that the phenomenon of coordination is taken to be both semantic (as opposed to syntactic) and essentially relational (as opposed to supervening on the intrinsic meanings of the individual terms)." (p. 491)

    "The present paper is a characteristically rich, original and thought-provoking contribution to the subject; and I am afraid that I can do no more than pick my way through one or two of the many interesting issues that she raises. However, any criticisms I make on this score should not be seen to detract from my broad agreement with much of what she says." (p. 496, a note omitted)

53. ———. 2021. "Constructing the Impossible." In *Conditionals, Paradox, and Probability: Themes from the Philosophy of Dorothy Edgington* , edited by Walters, Lee and Hawthorne, John, 141-163. New York: Oxford University Press.

    "In recent years, I have been working on a version of situation semantics - one might call it ‘truthmaker semantics’—which is meant to provide an alternative to possible worlds semantics. One of the things that has struck me about this alternative semantics is how easily it is able to accommodate the impossible. Rather than being an artificial addition to the possibilist semantics, the impossible emerges as a natural —one might almost say *inevitable* — extension of the possible, in much the same way in which the system of real numbers emerges as a natural extension of the rational number system or the system of complex numbers emerges as a natural extension of the real number system. It is the aim of this paper

to show how this is so; and, if I am successful, then this will constitute an argument for the admission of the impossible into semantics—something which I myself have been slow to appreciate — but also for truthmaker semantics itself as a viable and valuable alternative to the possible worlds approach.

I begin with an exposition of a standard approach to truthmaker semantics, using possible states in place of possible worlds (Section 9.1). I go on to describe a key construction, analogous to the extension of the rationals to the reals, for extending a space of possible states to one that also contains impossible states (Section 9.2). This has a number of advantages — mathematically and in theory and application — over the more usual approaches (Section 9.3-9.4). I then describe another construction, somewhat analogous to the extension of the reals to the complex numbers, which provides further resources for countenancing the impossible and further applications (Section 9.5).

I conclude with a lengthy formal appendix." (pp. 143-144)

54. ———. 2021. "Truthmaking and the is–ought gap." *Synthese* no. 198:887–914.

Abstract: "This paper is an attempt to apply the truthmaker approach, recently developed by a number of authors, to the problem of providing an adequate formulation of the is–ought gap. I begin by setting up the problem and criticizing some other accounts of how the problem should be stated; I then introduce the basic apparatus of truth-making and show how it may be extended to include both descriptive and normative truth-makers; I next consider how the gap principle should be formulated, attempting to deal as systematically as possible with the 'harmless' counter-examples; I also consider the relationship between the gap principle and various other doctrines concerning the separation between the normative and descriptive realms; and I conclude this part of the paper with some general remarks in favor of adopting the truth-maker approach over some of the alternative approaches. The paper concludes with a formal appendix, which gives precise

expression to some of claims made in the previous informal part of the paper."

55. ———. 2021. "Some Remarks on the Role of Essence in Kripke's “Naming and Necessity”." *Theoria* :1-3.

    First on line.

    Abstract: discuss the use Kripke makes of the concept of essence in "Naming and Necessity"."

    "So much has already been written about *Naming and Necessity* ; and all that I would like to do in what follows is to make a few brief remarks about the relationship between the notions of essence and de re necessity in that work. Now, it might be thought that these remarks could be very brief indeed." (p. 1)

56. ———. 2021. "Critical Notice. The Metaphysics and Mathematics of Arbitrary Objects, by Leon Horsten. Cambridge: Cambridge University Press, 2019." *Mind* :1-16.

    First online.

    "This book is an attempt to develop a metaphysical and mathematical account of arbitrary objects. It is focused on two main applications: structuralism in the philosophy of mathematics; and the concept of a random variable in probability theory. However, the book deals with a host of other topics along the way.

    (...)

    "Clearly, I cannot deal with all of these topics in a single review. (1)

    But what I would like to do is to focus on certain central issues over which there is room for reasonable disagreement, even for those of us who are already willing to accept arbitrary objects." (pp. 1-2)

    (1) hope to deal with some of these topics, and especially the issue of how the theory of arbitrary objects should be axiomatized, in a new introduction to the re-issue of ‘Reasoning with Arbitrary Objects’ (Fine (1985)), to be published by OUP.

57. Fine, Kit, Boghossian, Paul, and Peacocke, Christopher. 2021. "The Live Concert Experience: Its Nature and Value." In *Classical Music* , 7-13. Open Edition Books.

    "Virgil Thomson, the composer and music critic, wrote thatwe never enjoy a recorded performance in the same way aswe enjoy a live performance (2014: 251). The same applies to live performance in the theatre and to attendance at a sports event, as opposed to seeing a performance or game on DVD or a TV recording. This difference is of great value to us. But why?" (p. 8)

Kit Fine: bibliography of the unpublished papers available on line

Unpublished papers

1. Fine, Kit. 1969. *For some Proposition and so many Possible Worlds*, University of Warwick.

   Available at: For some Proposition and so many Possible Worlds

   "In this thesis, I deal with the notions of a condition holding for some proposition and a proposition being true in a certain number of possible worlds. These notions are called propositional quantifiers and numerical modalizers respectively.

   In each chapter, I attempt to dispose of a system. A system consists of: a language; axioms and rules of inference; and an interpretation. To dispose of a system is to prove its decidability and its consistency and completeness for the given interpretation. I shall, in passing, make applications to de finability, translatability and other topics." (From the Abstract)

2. ———. 2010. "The Structure of Joint Intention (Draft)."1-50.

   Available at The Structure of Joint Intention (Draft)

   "The topics of joint intention and response dependence are not normally thought to be connected. But it is my belief that that there are problems concerning the very possibility of joint intention that can only be satisfactorily resolved by providing a

response dependent account of what it is. Our having a joint intention will in part be realized by our responding to it as a joint intention.

I shall begin by outlining the problems and then consider various attempted solutions to them. None of them turns out to be satisfactory. I shall then outline a theory of response dependent concepts and show how it is able to solve the problems and provide a satisfactory account of joint attention. I conclude by briefly considering the application of the theory of response dependence to other topics in social philosophy, including the prisoners' dilemma and the concept of law.

The paper was hurriedly written and very rough. Many important topics are barely discussed and some are not even mentioned. But I hope I have said enough to make clear how a number of issues concerning joint intention can be put on a firmer footing and how a theory of response dependence can be of help in resolving them." (p. 1)

3. ———. 2012. "The Essential Glossary of Ground."1.

   Available at The Essential Glossary of Ground

   "ground - a philosophical foodstuff, considered by some to be the elixir of life and by others to be

   a deadly poison." (p. 1)

4. ———. 2015. "Mathematics and the Method of Abstraction."1-10.

   Available at Mathematics and the Method of Abstraction

   Public Lecture.

   "It is a familiar thought that mathematics derives from abstraction.

   (...)

   Abstraction may be a familiar idea but it is also vague. What exactly is abstraction?

   From what do we abstract? To what do we abstract? And how do we get from the one to the other?

These are questions which have been discussed since the beginning of mathematics and philosophy. But what I want to consider is the discussion of the questions in a particular period and by a particular group of people. The period was the end of the nineteenth century and the early twentieth century. And the people in question were mathematicians who had a strong interest in foundational issues. They were not only concerned to do mathematics but also to put the subject on a firm foundation. All of the mathematicians involved - with one or two exceptions - were German. I do not know whether or not this was accidental, though it does speak to the great contribution that German mathematicians were then making to their subject." (p. 1)

5. ———. 2015. "A Theory of Truth-Conditional Content I: Conjunction, Disjunction and Negation."1-40.

   Available at A Theory of Truth-Conditional Content I: Conjunction, Disjunction and Negation

   "The semantic content of a statement is often taken to be its truth-conditional content, as constituted by the conditions under which it is true. But there are somewhat different ways to understand what these truth-conditions are. On the clausal approach, especially associated with the name of Davidson, the truth-conditions of a statement are not entities as such but the clauses by which a truth-theory specifies when a statement is true. On the objectual approach, by contrast, the truth-conditions are objects, rather than clauses, which stand in a relation of truthmaking to the statements they make true.

   Under the most familiar version of the objectual approach, the truth-conditions of a statement are taken to be possible worlds and the content of a statement may, accordingly, be identified with the set of possible worlds in which it is true. Under a somewhat less familiar version of the entity-based approach, the truth-conditions are not - or not, in general - possible worlds but possible states or situations - fact-like entities that make up a world rather than the worlds themselves; and the content of a statement may, in this case, be identified with the set of verifying states or situations in which it is true.

In this paper I pursue the last of these options. However, my understanding of what it is for a state to verify a statement is somewhat unusual. It is often supposed that verification is monotonic; if a state verifies a statement then so does any more comprehensive state. But on the account that I wish to adopt, this will not be generally true. For it is to be a general requirement on verification that a verifier should be relevant as a whole to the statement that it verifies; and in extending a verifier with additional material, this holistic relevance of the verifier to the statement may be lost." (p. 1)

6. ———. 2015. "A Theory of Truth-Conditional Content II: Subject-matter, Common Content, Remainder and Ground."1-25.

   Available at A Theory of Truth-Conditional Content II: Subject-matter, Common Content, Remainder and Ground

   "We continue with the development of the theory of truth-conditional content begun in part I, dealing with such 'non-standard' topics as subject matter, common content, logical remainder and ground. This is by no means an exhaustive list of topics that might have been considered but it does provide an indication of the nature and scope of the theory. As before, the paper is divided into an informal exposition and a technical addendum. Both can be read independently of the other but it would be helpful, in either case, to have the first part at hand.

   One feature of great interest in the present account is that it deals with a number of the topics that lack an adequate treatment either within the possible worlds account or under a structural conception of propositions. The notion of common content, for example, can be readily handled within the present framework but cannot be properly handled in the other two frameworks without either introducing or deriving something like the present conception of verification. Thus we should not simply regard the present 'extensional' conception of content as a mere approximation to a structural conception but as an important conception in its own right." (p. 1)

7. ———. 2015. "The Sorites."

Available at The Sorites

"No treatment of vagueness is complete without an account of the sorites argument. This argument, in a familiar form, starts with the premiss that a given man (with no hairs on his head) is bald, it proceeds to the intermediate conclusion that a man with very slightly fewer hairs on his head is bald, given the assumption that a slight difference in the number of cranial hairs can make no difference to whether someone is bald, and it then proceeds, by a large number of further steps of this sort, to the final conclusion that a man with a full head of hair is bald, which is clearly absurd." (p. 1)

8. ———. 2016. "Acts and Embodiment." In, 1-17.

   Available at Acts and Embodiment

   "I wish in this paper to consider how the theory of embodiment outlined in some of my earlier papers (Fine [1982], [1999]) [2006]) can be applied to questions concerning the identity of acts. This will involve going over some old ground. But I also hope to elaborate on what I previously said and to relate it to some of the more recent literature on the topic." (p. 1)

   Available at Mathematical Existence

   "Anyone who has thought about the nature of mathematics has probably been puzzled over the status of its objects. Are the objects with which mathematics deals - numbers, sets,

functions and the like - created or are they discovered? Should we think of them in the manner of the stars and the planets, whose character and existence is entirely independent of our investigations and activities? Or should we think of them in the manner of the objects of fiction, whose existence and character is entirely dependent upon what their authors make of them?" (p. 1)

10. ———. 2019. "Chisholm's Puzzle and Unconditional Obligation."1-19.

    Available at Chisholm's Puzzle and Unconditional Obligation

    "In this paper, I would like to suggest a new angle on Chisholm's puzzle concerning contrary-to-duty obligations. It differs from previous approaches in its conception of what the problem is and how it is to be solved. I shall argue that the problem is, in no small part, about unconditional, rather than conditional, obligation and that, once it is viewed in this light, we obtain a somewhat different perspective on how the puzzle might be solved." (p. 1)

11. Fine, Kit, and Martin, Errol. 2020. "Progressive Logic." In, 1-45.

    Available at Progressive Logic

    "An argument is commonly taken to be circular when the truth of its conclusion is presupposed by its premisses. But exactly what is meant by such an account is not at all clear. For there is a sense in which the truth of the conclusion of any deductively valid argument is presupposed by its premisses. Thus if there is to be a significant distinction between those valid arguments that are circular and

    those that are not, then some basis must be found for distinguishing between the trivial kind of presupposition and one that is more substantive." (p. 1)

12. Fine, Kit. 2021. "A Theory of Partial Truth." In.

    Available at A Theory of Partial Truth

"I develop a theory of partial truth within the framework of truth-conditional content developed in two earlier papers (Fine [2015a] and [2015b]). It will be helpful, though not essential, to have these two other papers at hand, and especially the first, while reading the present paper. The paper should have interest both as an account of partial truth and as a partial vindication of the truth-conditional framework within which it is developed. For without something like the present framework, it is hard to see how a reasonable alternative account of partial truth might be developed. The concept of partial truth is intimately related to the concept of partial content, since we naturally suppose that a proposition is partially true when some part of it is true. The connection between the two concepts can also be put to work in the opposite direction, since we may provide a semantics for the logic of partial content by appeal to partial truth (as in §9 of Fine [2015]).

There is also a close connection with the concept of verisimilitude. For a proposition will be partially true when it has 'more truth' than a proposition that is not partially true; and the investigation of the concept of partial truth may, in fact, serve as a useful prolegomena to the investigation of the more complicated concept of verisimilitude.

(...)

I begin with an informal introduction to some of the main ideas and conclude with a formal appendix. The introduction and appendix can in principle be read in isolation from the other though they are best read together. The most extensive previous treatment of the topic that I know of is in Humbersone [2003]; and a related account of partial truth is given in §1.3 of [2014]. The major difference from Humberstone is that he stipulates the truth-tables for a logic of partial truth while I derive them from an underlying account of partial truth; and the major difference from Yablo is that I provide an account of partial truth directly in terms of truthmakers and not indirectly through the notion of partial content." (p. 1)

14. Fine, Kit, and de Rosseet, Louis. 2021. "A Semantics for the Impure Logic of Ground."

    Avalaible at A Semantics for the Impure Logic of Ground

    "This paper establishes a sound and complete semantics for the impure logic of ground. Fine [2012a] sets out a system for the pure logic of ground, one in which the formulas between which ground-theoretic claims hold have no internal logical complexity; and it provides a sound and complete semantics for the system.

    Fine [2012b, §§6-8] sets out a system for an impure logic of ground, one that extends the rules of the original pure system with rules for the truth-functional connectives, the first-order

quantiers, and λ-abstraction. However, it does not provide a semantics for this system. The present paper partly fills this lacuna by providing a sound and complete semantics for a system GG containing the truth-functional operators that is closely related to the truth-functional part of the system of [Fine, 2012b].(1)" (p. 1)

(1) The main differences between the two systems are that we now only allow finitely many formulas to occur to the left of the ground-theoretic operator and that we have added the Irreversibility Rule, which should have been part of the original system.

    Available at The Logic of Logical Necessity

    Abstract: "Prior to Kripke's seminal work on the semantics of modal logic, McKinsey offered an alternative interpretation of the necessity operator, inspired by the Bolzano-Tarski notion of logical truth. According to this interpretation, `it is necessary that A' is true just in case every sentence with the same logical form as A is true. In our paper, we investigate this interpretation of the modal operator, resolving some technical questions, and relating it to the logical interpretation of modality and some views in modal metaphysics. In particular, we present an hitherto unpublished solution to problems 41 and 42 from Friedman's *102 problems* , which uses a different method of proof from the solution presented in the paper of Tadeusz Prucnal."

Kit Fine. Annotated bibliography of the studies on His philosophy

Studies on the Philosophy of Kit Fine

1. Correia, Fabrice. 2005. *Existential Dependence and Cognate Notions* . München: Philosophia Verlag.

   Contents: Preface 3; Introduction 7; 1. Preamble; 13; Introductory Break 35; 2. Simple Dependence: Presentation, and Rejection of Some Accounts 39; 3. Metaphysical Grounding 53; 4. Simple Dependence: The Foundational Approach 65, 5. Some Other Notions of Existential Dependence 89; 6. A Cognate Notion: Supervenience 131; Appendix 151; Bibliography 151; List of Figures 165; List of Symbols and Notations 167; List of Named Propositions, Conditions and Rules 169; Index 171.

   "This is a work in analytic metaphysics. Its main purpose is to clarify a notion of central importance in metaphysics since Aristotle, to wit the notion of existential dependence. All currently available analyses of the notion are examined and then rejected, and a new account is defended. This work is the first comprehensive one on the topic. The first chapter is devoted to introducing and explaining some notions which are crucial for the central parts of the work, namely the notions of existence, necessity, (individual and plural) quantification and essence. In chapters 2 and 4 focus is made on the relation of " simple" existential dependence, the relation which holds between two objects when the first cannot exist without the other. Three accounts of simple dependence - each endorsed by

some contemporary philosophers, among them Kit Fine, E. Jonathan Lowe, Kevin Mulligan, Peter Simons and Barry Smith - are presented and then rejected. A new account, inspired by suggestions by Fine and Lowe, is defended. According to that account - the " foundational" account - simple dependence is to be defined in terms of a relation called *grounding* , which is presented in chapter 3. Chapters 5 and 6 deal with relations belonging to the family of simple dependence, among others (i) generic dependence, (ii) various forms of temporal dependence, and (iii) supervenience, a complex dependence relation largely invoked in current debates on the philosophy of mind. It is shown that foundationalist accounts of these notions - i.e. accounts framed in terms of grounding - are superior to other existing accounts. These chapters also contain some applications of the foundational conception of dependence, in particular a characterization of substances and a formulation of the distinction between two well known conceptions of universals, the Aristotelian and the Platonician conception. The last part of the work is a technical appendix where one can find, among other things, a system for the logic of essence, which is proved to be sound and complete with respect to a possible world semantics."

"The notion of metaphysical grounding is close to a notion Fine introduces in [Fine, 2001] (§5) and which he calls ‘ground’. In Fine’s sense, the proposition that A is grounded in the propositions that B, C,... iff its being the case that A consists in nothing more than its being the case that B, C,... According to Fine, grounding propositions explain what they ground. Fine’s notion of ground is strictly stronger than metaphysical grounding: I wish to leave room for the view that the existence of a set is explained by, but does not merely consist in, the existence of its members. And it is likewise strictly stronger than logical grounding.

It is also close to Bolzano’s notion of grounding. (2) One difference is that Bolzano takes this notion to express a relation between propositions or pluralities of propositions, construed as genuine, mind-independent entities. (3) For my part, as I previously stressed, I leave aside the question as to whether

statements of ground point to propositions, facts or states of affairs. A second difference lies in that Bolzano takes it that causal connections give rise to facts of grounding: for every causal fact, a proposition describing some relevant features of the effect is grounded in a proposition describing some relevant features of the cause. (4) This presumably does not hold of metaphysical grounding. Bolzano's notion of grounding is perhaps equivalent to the "logical sum" of all qualified notions of grounding." (p. 56)

3. Rieber, Steven. 2002. "A Defense of Indeterminism." *Acta Analytica* no. 17:75-82.

   Abstract: "My goal is to defend the indeterminist approach to vagueness, according to which a borderline vague utterance is neither true nor false. Indeterminism appears to contradict bivalence and the disquotational schema for truth. I agree that indeterminism compels us to modify each of these principles. Kit Fine has defended indeterminism by claiming that ordinary ambiguous sentences are neither true nor false when one disambiguation is true and the other is false. But even if Fine is right about sentences, his point does not seem to generalize the utterances. What the indeterminist needs -- and what ordinary ambiguity does not provide -- is an ambiguous utterance where what is being said is indeterminate between two different propositions. I will show that such cases exist. These cases imply that the modifications that indeterminism makes to bivalence and the disquotational schema are required independently of indeterminism, in fact independently of vagueness."

4. Suster, Danilo. 2005. "The Modality Principle and Work-relativity of Modality." *Acta Analytica* no. 20:41-52.

   "If we accept Fine's theory then modal properties, contrary to the modal principle, are not an independent guide to constitutive properties of an artwork. Rather, they depend on a prior decision on the identity of a work. Of course, all essential properties are necessary, so those modal intuitions that track the nature of the object in question still remain a guide to essentiality. But in the first part of my comment I expressed a fear that even those modal intuitions are not a reliable guide, they do not fix something objective and unique. Individual essences are murky properties and I am afraid that our appreciative engagement with a work of art cannot offer

objective answers about them. My scruples could be read as scruples about contextualism in general and not directed specifically to Davies' proposal. (*)

Anyway, maybe this is the price we have to pay when we evaluate ontological proposals on the basis of their fit with a more comprehensive philosophical framework that makes sense of our artistic practice as that practice is 'codified' upon rational reflection." (p. 52)

[David Davies, *Art as Performance* , Oxford, Blackwell 2004.]

5. Sosa, David. 2010. "The Fine Line." *Analysis* no. 70:347-358.

   Critical notice of Kit Fine, *Semantic Relationism* (2007).

   "The purpose of Fine's book is to show how the guiding idea, the 'semantic relationism' of the title, helps with deep puzzles in philosophy of language and mind. Russell's antinomy of the variable, Frege's puzzle in both a linguistic and a cognitive version, and Kripke's puzzle about belief are said to be solved adequately only by adopting his relationism. But the book is also a defence of 'referentialism' in philosophy of language. Fine holds that the fundamental semantic relations that need to be added to the assigned intrinsic values in our overall semantic theory, especially the relation he calls 'coordination', can do much of the work of sense. A relationist referentialism 'can secure many of the advantages of the Fregean position without being committed to the existence of sense'.

   In this selective review, I will not evaluate how Fine's line on these matters fares overall. There's a risk of unfairness in that, since part of any view's success can be measured only holistically, by balancing whatever disadvantages it might have with such emergent features as its unifying power and generality, and the consistency of its successes (as against its failures). Having signalled this, however, I will focus on just a few specific passages, and raise some corresponding issues and concerns." (p. 347)

6. deRosset, Louis. 2015. "Better Semantics for the Pure Logic of Ground." *Analytic Philosophy* no. 56:229-252.

Abstract: Philosophers have spilled a lot of ink over the past few years exploring the nature and significance of grounding. Kit Fine has made several seminal contributions to this discussion, including an exact treatment of the formal features of grounding [Fine, 2012a]. He has specified a language in which grounding claims may be expressed, proposed a system of axioms which capture the relevant formal features, and offered a semantics which interprets the language. Unfortunately, the semantics Fine offers faces a number of problems. In this paper, I review the problems and offer an alternative that avoids them. I offer a semantics for the pure logic of ground that is motivated by ideas already present in the grounding literature, and for which a natural axiomatization capturing central formal features of grounding is sound and complete. I also show how the semantics I offer avoids the problems faced by Fine's semantics."

7. Correia, Fabrice, and Rosenkranz, Sven. 2012. "Eternal Facts in an Ageing Universe." *Australasian Journal of Philosophy* no. 90:307-320.

   Abstract: "In recent publications, Kit Fine devises a classification of A-theories of time and defends a non-standard A-theory he calls fragmentalism, according to which reality as a whole is incoherent but fragments into classes of mutually coherent tensed facts. We argue that Fine's classification is not exhaustive, as it ignores another non-standard A-theory we dub dynamic absolutism, according to which there are tensed facts that stay numerically the same and yet undergo qualitative changes as time goes by. We expound this theory in some detail and argue that it is a serious alternative to the positions identified by Fine."

8. Simons, Peter M. 2008. "Modes of Extension: Comments on Kit Fine's 'In Defence of Three-Dimensionalism'." In *Being: Developments in Contemporary Metaphysics* , edited by Le

Poidevin, Robin, 17-22. Cambridge: Cambridge University Press.

"The debate between 3- and 4-dimensionalists is one of the most lively and pervasive in current metaphysics. At stake is a glittering prize: the correct metaphysical analysis of material things and other objects commonly thought to persist in time by enduring. Since we count ourselves among such objects the outcome of the debate is of more than merely academic interest to us. Obviously the ramifications of the debate, even of the points raised by Kit Fine, go far beyond what I can discuss here, so I shall simply select some salient issues and comment on them from my own somewhat heterodox point of view." (p. 17)

9. Cook, Roy T., and Ebert, Philip. 2004. "Discussion Note: Kit Fine's *Limits of Abstraction* ." *British Journal for the Philosophy of Science* no. 55:791-800.

   "Kit Fine's recent *The Limits of Abstraction* , an extended version of his [1998] paper, contains four chapters. The first two deal with philosophical aspects of abstraction, while the latter two provide the formal framework for a general theory of abstraction. Here we focus on the philosophical material, and, given the depth and complexity of the material, cannot attempt even a superficial summary of the entirety of the philosophical material. Thus, we content ourselves with sketching the contents. Two particular issues will then be examined in greater detail."

10. Evnine, Simon J. 2009. "Constitution and Qua Objects in the Ontology of Music." *British Journal of Aesthetics* no. 49:203-217.

    Abstract: "Musical Platonists identify musical works with abstract sound structures but this implies that they are not created but only discovered. Jerrold Levinson adapts Platonism to allow for creation by identifying musical works with indicated sound structures. In this paper I explore the similarities between Levinson’s view and Kit Fine’s theory of qua objects. Fine offers the theory of qua objects as an account of constitution, as it obtains, for example, between a statue and the clay the statue is made out of. I argue that Fine’s theory

does not adequately characterize the constitution relation and that the problems it faces extend to Levinson's account of musical works as indicated structures. I develop an alternative theory of constitution, based on the notion of being made out of. This approach to constitution enables me to offer an account of musical works as abstract objects that are constituted by sound structures. I argue that my account has several advantages over the Levinson/Fine approach."

12. Correia, Fabrice. 2007. "(Finean) Essence and (Priorean) Modality." *Dialectica.International Journal of Philosophy* no. 61:63-84.

    Abstract: "In Fine 1994, Kit Fine challenges the (widespread) view that the notion of essence is to be understood in terms of the metaphysical modalities, and he argues that it is not essence which reduces to metaphysical modality, but rather metaphysical modality which reduces to essence.

    In this paper I put forward a modal account of essence and argue that it is immune from Fine's objections. The account presupposes a non-standard, independently motivated conception of the metaphysical modalities which I dub Priorean. Arthur Prior never endorsed that very conception, but in some respects his own views on the topic are so close to it, and different from all (most?) currently accepted views, that the label 'Priorean' is perfectly appropriate."

13. García-Carpintero, Manuel. 2007. "Bivalence and What Is Said." *Dialectica.International Journal of Philosophy* no. 61:167-190.

    Abstract: "On standard versions of supervaluationism, truth is equated with supertruth, and does not satisfy bivalence: some truth-bearers are neither true nor false. In this paper I want to confront a well known worry about this, recently put by Wright as follows: 'The downside . . . rightly emphasized by Williamson . . . is the implicit surrender of the T-scheme'. I will argue that such a cost is not high: independently motivated philosophical distinctions support the surrender of the T-scheme, and suggest acceptable approximations."

14. Horwich, Paul. 2007. "The Quest for Reality." *Dialectica.International Journal of Philosophy* no. 61:5-16.

    Abstract: "A widespread concern within philosophy has been, and continues to be, to determine which domains of discourse address real, robust, not-merely-deflationary facts, and which do not. But a threat to the legitimacy of this concern (together with the claims provoked by it) is the extreme lack of consensus amongst philosophers on the question of how to tell whether or not a given domain is oriented towards ‘robust reality’. The present paper criticizes Kit Fine’s attempt to settle that question. This discussion is followed by some considerations suggesting that there is no good answer to it, that (as the ‘quietists’ maintain) the notion of ‘robust reality’ is defective and ought to be abandoned."

15. Koslicki, Kathrin. 2007. "Towards a Neo-Aristotelian Mereology." *Dialectica.International Journal of Philosophy* no. 61:127-159.

    Abstract: "This paper provides a detailed examination of Kit Fine’s sizeable contribution to the development of a neo-Aristotelian alternative to standard mereology; I focus especially on the theory of ‘rigid’ and ‘variable embodiments’, as defended in Fine 1999. Section 2 briefly describes the system I call ‘standard mereology’. Section 3 lays out some of the main principles and consequences of Aristotle’s own mereology, in order to be able to compare Fine’s system with its historical precursor. Section 4 gives an exposition of Fine’s theory of embodiments and goes on to isolate a number of potential concerns to which this account gives rise. In particular, I argue that (i) Fine’s theory threatens to proliferate primitive sui generis relations of parthood and composition, whose characteristics must be stipulatively imposed on them, relative

to particular domains; (ii) given its 'superabundance' of objects, Fine's system far outstrips the (arguably) already inflated ontological commitments of standard mereology; and (iii) there is a legitimate question as to why we should consider Fine's primitive and sui generis relations of parthood and composition to be genuinely mereological at all, given their formal profile. These three objections lead me to conclude that we ought to explore other avenues that preserve the highly desirable, hylomorphic, features of Fine's mereology, while avoiding its methodological and ontological excesses."

16. MacBride, Fraser. 2007. "Neutral Relations Revisited." *Dialectica.International Journal of Philosophy* no. 61:25-56.

    Abstract: "Do non-symmetric relations apply to the objects they relate in an order? According to the standard view of relations, the difference between aRb and bRa obtaining, where R is nonsymmetric, corresponds to a difference in the order in which the non-symmetric relation R applies to a and b. Recently Kit Fine has challenged the standard view in his important paper 'Neutral Relations' arguing that non-symmetric relations are neutral, lacking direction or order.

    In this paper I argue that Fine cannot account for the application of non-symmetric relations to their relata; so far from being neutral, these relations are inherently directional."

17. Weir, Alan. 2007. "Honest Toil or Sheer Magic?" *Dialectica.International Journal of Philosophy* no. 61:89-115.

    Abstract: "In this article I discuss the 'procedural postulationist' view of mathematics advanced by Kit Fine in a recent paper [*]. I argue that he has not shown that this view provides an avenue to knowledge of mathematical truths, at least if such truths are objective truths. In particular, more needs to be said about the criteria which constrain which types of entities can be postulated. I also argue that his reliance on second-order quantification means that his background logic is not free of

ontological commitment and that his doctrine of ‘creative expansion’ only makes sense from a radically anti-realist perspective."

{* Fine, K. 2005, ‘Our Knowledge of Mathematical Objects’, in: T. Z. Gendler and J. Hawthorne eds., *Oxford Studies in Epistemology* Vol. 1, Oxford: Clarendon Press, pp. 89–109.]

18. Hinzen, Wolfram. 2003. "Constructive versus Ontological Construals of Cantorian Ordinals." *History and Philosophy of Logic* no. 24:45-63.

    Abstract: "In a recent paper, Kit Fine offers a reconstruction of Cantor's theory of ordinals. It avoids certain mentalistic overtones in it through both a non-standard ontology and a non-standard notion of abstraction. I argue that this reconstruction misses an essential constructive and computational content of Cantor's theory, which I in turn reconstruct using Martin-Löf's theory of types. Throughout, I emphasize Kantian themes in Cantor's epistemology, and I also argue, as against Michael Hallett's interpretation, for the need for a constructive understanding of Cantorian 'existence principles'."

19. Kuhn, Steven T. 2006. "Review of *Modality and Tense: Philosophical Papers* , by Kit Fine." *International Philosophical Review* no. 46:492-502.

    "Fine sees himself as defending two very plausible views--that the distinction between the necessary and the contingent is intelligible and that merely possible worlds are not real in the same sense as the actual world–against pervasive philosophical orthodoxies that deny them. I can’t resist noting that his own theories occasionally lead him to views that seem implausible: Ordinary objects (or at least sequences of them) have logical form, abstract objects may exist contingently. A formula of the form [A if and only if the proposition expressed by A is true] may be false. “Being” should to be distinguished from existence and (as was noted above) there is a sense in which the fountain of youth exists. There are good reasons to embrace the view that reality contains contradictory facts. It is a testament to Fine’s meticulous examination of the issues involved and his

skill in communicating it that many of these positions seem quite plausible, and all of them far less implausible, after the book is read." (p. 502)

20. Correia, Fabrice. 2000. "Propositional Logic of Essence." *Journal of Philosophical Logic* no. 29:295-313.

    Abstract: "This paper presents a propositional version of Kit Fine's (quantified) logic for essentialist statements, provides it with a semantics, and proves the former adequate (i.e. sound and complete) with respect to the latter."

    "The present paper can be considered as a companion to Kit Fine's papers 'The Logic of Essence' and 'Semantics for the Logic of Essence'. (1) In the first paper Fine presents a logical system for quantified essentialist statements, E5. (2) In the second he presents a semantics for a variant of the system, and proves this system adequate (i.e. sound and complete) with respect to that semantics. I propose here a Kripke-style semantics for E5π, a propositional counterpart of E5, and prove the adequacy of the latter with respect to the former.

    There are many, more or less natural, more or less interesting, ways to extend E5π (or one of its cousins) to a system of quantified logic of essence. E5π, together with its semantics, is intended to constitute the core of subsequent, more expressive, logics of essence. So, the study of E5π per se, regardless of possible quantificational extensions, is of great interest.

    Another interesting point about the present study lies in the fact that the completeness proof given here is much simpler than the one Fine gives for his quantificational system.

    The reader is strongly urged to take a look at Fine's papers on the logic of essence, if only because no detailed comparison between Fine's material and mine will be offred." (p. 295)

    (1) At the time I worked on the present paper only the first of Fine's papers was available to me. I became acquainted with 'Semantics for the Logic of Essence' after obtaining the results presented here.

(2) Fine aims at developing such a system in response to his own objections to the standard modal contruals of essence. See his ‘Essence and Modality’.

21. Kremer, Philip. 1989. "Relevant Predication: Grammatical Characterisations." *Journal of Philosophical Logic* no. 18:349-382.

    Abstract: "This paper reformulates and decides a certain conjecture in Dunn's *Relevant Predication 1: The Formal Theory* (Journal of Philosophical Logic 16, 347-381, 1987). This conjecture of Dunn's relates his object-language characterisation of a property's being relevant in a variable x to certain grammatical characterisations of relevance, analogous to some given by Helman, in *Relevant Implication and Relevant Functions* (in *Entailment: The Logic of Relevance and Necessity* , vol. 2, by Alan Ross Anderson, Nuel Belnap, and J. Michael Dunn et al.) In the course of the investigation this paper also investigates Kit Fine's semantics for quantified relevance logics, which appears in his appropriately titled *Semantics for Quantified Relevance Logic* ."

22. Mares, Edwin D., and Goldblatt, Robert. 2006. "An Alternative Semantics for Quantified Relevant Logic." *Journal of Symbolic Logic* .

    Abstract: "The quantified relevant logic RQ is given a new semantics in which a formula ∀x *A* is true when there is some true proposition that implies all x-instantiations of *A* . Formulae are modelled as functions from variable-assignments to propositions, where a proposition is a set of worlds in a relevant model structure. A completeness proof is given for a basic quantificational system QR from which RQ is obtained by adding the axiom EC of ‘extensional confinement’: ∀x(A ∨ B) → (A ∨ ∀xB), with x not free in A. Validity of EC requires an additional model condition involving the boolean difference of propositions. A QR-model falsifying EC is constructed by forming the disjoint union of two natural arithmetical structures in which negation is interpreted by the minus operation."

"Kit Fine [10] showed that the quantified relevant logic RQ is incomplete over Routley and Meyer's relational semantics with constant domains. In its place he developed [9] an increasing domain semantics over which RQ is complete, and for which a model includes a set of frames which are related to one another by a number of relations and operators. This semantics is powerful and ingenious.

But Fine's semantics is very complicated. Since it was produced it in the mid-1980s relevant logicians have wanted to simplify it. J. Michael Dunn and Greg Restall say [7, p 83]:

[I]t must be said that while the semantic structure pins down the behaviour of RQ and related systems exactly, it is not altogether clear whether the rich and complex structure of Fine's semantics is necessary to give a semantics for quantified relevance logics.(1)

To those of us who have seriously attempted to simplify Fine's semantics, it is becoming clear that the "rich and complex structure" is in a certain sense necessary.

The elements of the theory seem to work in concert with one another and eliminating even one operator or relation seems to make the entire structure collapse. Thus, in order to create a simpler semantics for quantified relevant logic we need to take an alternative approach.

In this paper, we take an alternative approach. (2)" (pp. 163-164)

(1) Restall also says [14, p 5]: "The groundbreaking work of [9] is formally astounding but philosophically opaque".

(2) After seventeen years of trying to modify Fine's semantics, Mares in particular is glad that an alternative has suggested itself.

23. Savitt, Steven. 2016. "Kit Fine on Tense and Reality." *Manuscrito* no. 39:75-96.

Abstract: "Kit Fine (2005, 2006) recently described and defended a novel position in the philosophy of time, fragmentalism. It is not often that a new (and even perhaps a

radically new) option appears in this old field, and for that reason alone these two essays merit serious attention. I will try to present briefly but fairly some of the considerations that Fine thinks favour fragmentalism. I will also weigh the merits of fragmentalism against the view that Fine presents as its chief rival, relativism, as well as the merits of both against the view that he calls anti-realism. Along the way, we should pick up a clearer picture of fragmentalism itself."

    "Coordination is the central notion of Kit Fine’s (1007) theory of meaning called *semantic relationism* .

    (...)

    The present manuscript attempts to answer the following question: What is coordination between proper names? Fine proposes two characterizations of this sort of coordination, which he also labels *representing as the same:* an intuitive test; and a technical definition. On the basis of the intuitive

characterization, I will maintain that coordination (viz. representing as the same) is grounded in a notion of understanding

distinct from the notion of linguistic competence. Whereas—as I will argue—we need a characterization of understanding in order to elucidate Fine's coordination, it is unclear how to provide one: three *prima facie* appealing proposals to characterize it will be examined and then dismissed as intrinsically implausible or as incompatible with Fine's relational semantics. Not even his technical characterization of coordination, involving the notion of semantic requirement, will enable us to escape the impasse. Ultimately, the problem of determining what exactly coordination between names is will remain open." (p. 360)

26. Correia, Fabrice. 2020. "More on the Reduction of Necessity to Essence." In *Metaphysics, Meaning and Modality: Themes from Kit Fine* , edited by Dumitru, Mircea, 265-282. New York: Oxford University Press.

    "Essence and Modality" has had a considerable impact on subsequent philosophical thinking about essence and modality. The paper argues that the traditional view that essence reduces to metaphysical modality is wrong. Many have found these arguments convincing and have accordingly abandoned the view. The paper also argues that the reduction goes the other way around, that is, that it is metaphysical modality which reduces to essence. Twenty years after the publication of "Essence and Modality," Kit Fine's reductive view has become widely recognized as one of the main contenders for a reductive account of metaphysical modality.

    There are several ways in which such a reductive account can be spelled out. In Correia 2012, I raised objections against one natural way of doing so, and developed an alternative account—the "rule-based" account—which relies on a brief suggestion Fine makes in Fine 1995a. The aim of the present chapter is twofold: first, I wish to strengthen the case for the rule-based account by criticizing alternative accounts,

including some accounts based on other suggestions made by Fine, or inspired by material one can find in his work; and second, I wish to discuss certain objections to the rule-based account and suggest how they can be met." (p. 265)

    "This book is the first edited volume on the philosophy of one of the most seminal and profound contemporary philosophers. Over the last forty-odd years, Kit Fine has been one of the most influential and original analytic philosophers. He has made provocative and innovative contributions to several areas of systematic philosophy, including philosophy of language, metaphysics, and the philosophy of mathematics,

    as well as a number of topics in philosophical logic, such as modal logic, relevance logic, the logic of essence, and the logic of vagueness. These contributions have helped reshape the agendas of those fields and have given fresh impetus to a number of perennial debates." (p. 1)

28. Forbes, Graeme. 2020. "Fine’s New Semantics of Vagueness." In *Metaphysics, Meaning and Modality: Themes from Kit Fine* , edited by Dumitru, Mircea, 164-179. New York: Oxford University Press.

    "My conclusion about Fine’s discussion of the three formulations of Sorites reasoning, then, is that it is a very great strength of compatibilist semantics that it diagnoses a problem in each of the three, using the same formal apparatus, and

other approaches which cannot do something like this are at an immediate disadvantage.

However, I also think that the fuzzy logic analysis of the three formulations is overall equally as effective, in particular because it is independently plausible that embedding fixed-point negation in “it is the case” produces an operator expressing semantic negation. So the seductiveness of apparent ¬∧-formulations is explained by revealing them to be ~∧-formulations." (p. 178, note omitted)

29. Godeon, Rosen. 2020. "What is Normative Necessity?" In *Metaphysics, Meaning and Modality: Themes from Kit Fine* , edited by Dumitru, Mircea, 205-233. New York: Oxford University Press.

    "If the account I have sketched is cogent, you can now entertain an alternative to Strong Supervenience: the view that the normative supervenes on the natural as a matter of normative necessity. (This follows from the normative necessity of pure moral principles, together with the further assumption that all normative facts are ultimately grounded in pure principles plus nonnormative facts.) These views disagree about the modal classification of remote worlds—worlds in which act utilitarianism is true and the natural facts are just as they are, for example. Everyone agrees that such worlds are impossible in a sense. The open

    question concerns the interpretation of the modal word in this formulation.

    Having seen the alternative, are you confident that these remote worlds must be metaphysically impossible—ruled out by the *natures* of the moral properties and relations? If so, you see more deeply into these natures than I do." (p. 228)

"My interest here is in what was arguably the most influential contribution: the paper “Some Connections between Elementary and Modal Logic” (1975b), and in particular its Theorem 3, which will be referred to as *Fine’s Canonicity Theorem* . It states that

any logic that is complete with respect to a first-order definable class of Kripke frames must be valid in its canonical frames ." (p. 317)

31. Hale, Bob. 2020. "The Problem of Modality." In *Metaphysics, Meaning and Modality: Themes from Kit Fine* , edited by Dumitru, Mircea, 234-246. New York: Oxford University Press.

    "There is no doubt that one major reason why *de re* modality has seemed especially problematic lies in the broadly linguistic conception of the source of necessary truth which was widely accepted by analytic philosophers throughout the middle decades of last century, in spite of Quine’s major onslaught on the notion of analytic truth or truth in virtue of meaning. Indeed, Quine himself—somewhat surprisingly, given his

    misgivings about analyticity—finds the essentialism to which he thinks acceptance of *de re* modalities commits us unpalatable precisely because it clashes with the logical empiricist orthodoxy that all necessity is rooted in meanings." (p. 235)

32. Koslicki, Kathrin. 2020. "Essence and Identity." In *Metaphysics, Meaning and Modality: Themes from Kit Fine* , edited by Dumitru, Mircea, 113-140. New York: Oxford University Press.

    "4 Conclusion

    My primary focus in this chapter has been on the question of how essentialists should attempt to meet Quine’s demand for necessary and sufficient conditions for the crossworld identity

of individuals. I examined six contenders for the role of crossworld identity principles: (i) an object's qualitative character; (ii) matter; (iii) origins; (iv) haecceities; (v) world-indexed properties; and (vi) form.

(...)

On balance, then, the sixth option deserves to be taken very seriously as a possible response to Quine's challenge, especially by neo-Aristotelians who are already motivated for other reasons to take on board a

hylomorphic conception of unified wholes. Many of these hylomorphists also accept a non-modal conception of essence and thus face the further difficult task, over and above what is required to meet Quine's challenge, of having to explain an object's *de re* modal profile in terms of facts about its essence. Haecceities and world-indexed properties are unlikely to be of much help with respect to this second challenge, while the forms of hylomorphic compounds are in fact well suited for this purpose." (p. 136)

33. Kroon, Fred, and McKeown-Green, Jonathan. 2020. "Ontology: What's the (Real) Question?" In *Metaphysics, Meaning and Modality: Themes from Kit Fine* , edited by Dumitru, Mircea, 13-37. New York: Oxford University Press.

"One way to philosophize is to ontologize: about physical objects, moral properties, properties, possibilia, numbers, sets, and much else. For Kit Fine, ontologizing differs from what happens in ordinary life when I affirm that there are chairs and from what happens at school when I explain that there is a prime number less than three.

(...)

Fine's most extensive treatment is to be found "The Question of Ontology" (Fine 2009) and related considerations are advanced in "The Question of Realism" (Fine 2001). In the first three, expository, sections of this chapter, we present Fine's ideas in the context of broader views that he elaborates in "What is Metaphysics?" (Fine 2012). Then we offer our responses." (p. 13)

34. Kuhn, Steven T. 2020. "Necessary, Transcendental, and Universal Truth." In *Metaphysics, Meaning and Modality: Themes from Kit Fine* , edited by Dumitru, Mircea, 183-204. New York: Oxford University Press.

    "The argument that Fine's puzzle, as originally formulated, provides evidence that Socrates' humanness is a transcendental, rather than a worldly, fact assumes that we are more reluctant to attribute necessity to propositions true because of the nature of individuals than to propositions true because of worldly circumstances, and that we find it still more difficult to attribute necessity to "hybrid" sentences. A simpler

    version of the argument, however, reaches the same conclusion under a more plausible understanding of the relation between necessary and transcendental truth. We may question Fine's emphasis on his two-premise puzzle and even, perhaps, his principal example of a transcendental truth. It is difficulty to deny, however, the interest and importance of the worldly–unworldly distinction and Fine's thought about it. We should be grateful to him for bringing this, as many other neglected topics in metaphysics, into focus." (p. 203)

35. Mackie, Penelope. 2020. "Can Metaphysical Modality Be Based on Essence?" In *Metaphysics, Meaning and Modality: Themes from Kit Fine* , edited by Dumitru, Mircea, 247-264. New York: Oxford University Press.

    "1 Introduction

    In his hugely influential paper "Essence and Modality" (1994), Kit Fine argued that the then orthodox view that essence can be understood in terms of metaphysical modality is fundamentally flawed. He proposed, in its place, the view that all metaphysical modality has its source in the essences or natures of things, where the notion of a thing's essence or nature can be understood in terms of a broadly Aristotelian notion of real definition.

    (...)

In spite of the attention that it has received, however, one aspect of Fine's revolutionary theory seems to me to have been surprisingly neglected. The theory appears to require that the relevant conception of real definition can itself be isolated without appeal to metaphysical modality. And I do not see how this requirement can be met. Hence I am genuinely puzzled about how an "essence-based" theory of metaphysical modality is possible. In this chapter, I explain my reasons for skepticism about this issue. I then briefly consider the implications of my argument for the relation between essence and metaphysical modality." (p. 247)

36. Moltmann, Friederike. 2020. "Variable Objects and Truthmaking." In *Metaphysics, Meaning and Modality: Themes from Kit Fine* , edited by Dumitru, Mircea, 368-394. New York: Oxford University Press.

    "This chapter will focus on a philosophically significant construction whose semantics brings together two important notions in Kit Fine's philosophy: the notion of truthmaking and the notion of a variable embodiment, or its extension, namely what I call a "variable object."

    The analysis of the construction this paper will develop will be based on an account of clausal complements of intensional verbs that is of more general interest, based on truthmaking and the notion of a cognitive product, such as a promise or a belief, rather than that of a proposition. On that account, the clausal complement of, for example, promise will characterize satisfaction situations of the reported promise,

    and the clausal complement of believe will characterize the truthmakers of the reported belief." (p. 368)

37. Ostertag, Gary. 2020. "Fine on Frege's Puzzle." In *Metaphysics, Meaning and Modality: Themes from Kit Fine* , edited by Dumitru, Mircea, 337-359. New York: Oxford University Press.

    "Kit Fine's *Semantic Relationism* (SR) provides a novel defense of referentialism—novel, in part, because of the specific challenge to referentialism it addresses and in part because of the techniques it introduces in its defense. SR takes on a

number of interrelated concerns, involving, principally, the interpretation of variables and the phenomenon of strict, or de jure, coreference. The purpose of the current chapter is to clarify, and place in a broader context, the problem of strict coreference and to provide a framework for understanding the proposed solution." (p. 337, a note omitted)

38. Percival, Philip. 2020. "Beyond Reality?" In *Metaphysics, Meaning and Modality: Themes from Kit Fine* , edited by Dumitru, Mircea, 38-51. New York: Oxford University Press.

    "My focus is the divide between reality and that which is beyond reality. On what I call an “all-encompassing” view of reality, this is the divide between everything and nothing: reality encompasses everything, and beyond it there is nothing at all.

    Opposed to the all-encompassing view is what I call a “restriction” view of reality: reality is coincident with some kind of restriction on, or partition of, what there is; it is not the case that what resides beyond reality is nothing.

    I have two main aims: to first classify restriction views of reality (§ 1), and then to assess a species of the restriction view that pertains to time and modality (§ 2)." (p. 38)

39. Sandu, Gabriel. 2020. "Indefinites, Skolem Functions, and Arbitrary Objects." In *Metaphysics, Meaning and Modality: Themes from Kit Fine* , edited by Dumitru, Mircea, 98-112. New York: Oxford University Press.

    "1 Introduction: Indefinites

    Indefinites can occur in a nested sequence of quantificational phrases like

    1. Every student read every paper that a professor recommended and also in combination with anaphoric pronouns as in

    2. A man smiles. He is happy.

    The nesting, on one side, and the anaphoric link, on the other, create an interpretational tension. The nesting favors a

quantificational interpretation of the indefinites according to which they behave more like any other quantificational NP, for example they enter into scopal (dependency) relations with other quantificational phrases. But the presence of discourse anaphora creates some pressure to interpret the indefinites referentially in a way which makes their semantical behavior resemble more that of proper names." (p. 98)

40. Shalkowski, Scott A. 2020. "Essence and Nominalism." In *Metaphysics, Meaning and Modality: Themes from Kit Fine* , edited by Dumitru, Mircea, 301-315. New York: Oxford University Press.

    "Kit Fine has produced an extensive and rich body of work bearing on the philosophy of modality.

    (...)

    "What is less than usual, though, I will also argue that essentialism can be made safe for nominalists. Not only should we be unimpressed with philosophy that expands our ontology for the sake of eliminating modality, we should also be unimpressed with philosophy that expands the domain to admit the abstract when it is in the business of being completely sober, serious, and aiming at non-modal truth-telling.

    Abstraction involves not arriving at principled, well-justified beliefs about abstract objects. It simply involves the failure to regard as important more and more features of (concrete) reality. One can hardly discover new ontology by caring less about—or by paying less attention to—the old ontology. The end result will be essentialism that is safe for nominalists." (pp. 301-302, anote omitted)

41. Urquhart, Alasdair. 2020. "Fine on Arbitrary Objects." In *Metaphysics, Meaning and Modality: Themes from Kit Fine* , edited by Dumitru, Mircea, 87-97. New York: Oxford University Press.

    "Introduction

Fine's remarkable theory of arbitrary objects has attracted less attention than it deserves. He expounded his theory in two papers (Fine, 1983; Fine, 19858a), and a monograph (Fine, 1985b). The aim of the present chapter is to provide a brief introduction to the theory, to discuss some of the historical background, and finally to sketch some connections with other areas in logic and philosophy. In the historical section, I shall try to elucidate the extent to which earlier writers anticipated Fine's theory, while in the last section, I attempt to expand on some of Fine's brief but suggestive remarks in his monograph." (p. 87)

"I have offered certain counterexamples to Fine's essence-based account of dependence, which more generally pose a difficulty for some of the principles (e.g., Localization) that he takes to characterize the connection between essence and dependence. Still, it will not have been lost on anyone that my criticisms here accept and aim to implement exactly the methodology that Fine took to show that modal accounts of essence and ontological dependence are incorrect, and for the same reason —namely, that it is of the first importance to characterize the key metaphysical notions in such a way that they do not inappropriately exclude any intelligible applications of those notions." (p. 299)

43. Frances, Bryan. 2006. "The New Leibniz' Law Arguments for Pluralism." *Mind* no. 115:1007-1022.

"Ordinary macroscopic material objects A and B coincide at a time if at that time they share the very same spatial regions and are made of the same underlying matter. Many philosophers hold that some easily possible or even actual material objects that coincide at a time are nonidentical, for example, a statue and the hunk of clay that it is materially coincident with. Following Kit Fine (2003), I will call those philosophers pluralists. Other philosophers, monists, think that there are no pairs of distinct coincident ordinary material objects.

Some of the paradoxes of material constitution are frightfully difficult to solve, and it is almost always agreed that any response to them will be at least somewhat counterintuitive, so the oddity of pluralism is not its refutation. (1) Fine (2003) has developed further than anyone else a new set of Leibniz's Law arguments for pluralism. Using Leibniz's Law to argue for pluralism is not new. Many find intuitive the idea that a statue but not the hunk of clay from which it is made cannot survive being flattened; by Leibniz's Law we can conclude that the statue is not the hunk of clay, or so it appears. The new arguments are intended to be superior to the familiar arguments in two ways: they do not rely on controversial modal and temporal intuitions, and they suggest serious errors in the monist's replies to the old Leibniz's Law arguments.

The new arguments are a welcome addition to the literature, as the traditional Leibniz's Law arguments for pluralism have already been very thoroughly examined. However, it seems to me that the monist has plausible responses to the new arguments. I agree with Fine that monism is probably false, but I do not see how the new arguments mount a good case against it." (pp. 1007-1008)

(1) I do not mean to imply that the problems of coincidence are the only problems of material composition. Even more serious composition problems are found when investigating the questions 'Under what conditions does composition happen?' and 'When taking atoms away from a pumpkin, when does one

no longer have a pumpkin?' Indeed, without a satisfactory solution to the latter problems, I do not see how we can be confident regarding our responses to the material coincidence problems.

44. King, Jeffrey C. 2006. "Semantics for Monists." *Mind* no. 115:1023-1058.

Abstract: "Assume that the only thing before you is a statue made of some alloy. Call those who think that there is one thing before you in such a case monists. Call those who think there are at least two things before you in such a case pluralists. The most common arguments for pluralism run as follows. The statue is claimed to have some property P that the piece of alloy lacks (or vice versa), and hence it is concluded that they are distinct. Most often, the predicates employed in such arguments to express the crucial property are predicates expressing `temporal properties', such as existing at a certain time; or `modal properties', such as possibly being spherical; or `constitution properties', such as being made of a certain sort of material. In a recent paper, Kit Fine has noted that such predicates suffer from various defects that make it possible for the monist to plausibly resist the relevant versions of the pluralist's arguments. For this reason, Fine considers a number of predicates that do not suffer from these defects, and constructs new versions of the above argument using them. Fine argues that any attempt on the monist's part to resist his versions of the argument force the monist to adopt implausible positions in the philosophy of language. As against this, I argue that the monist has perfectly plausible responses to Fine's arguments that require the monist to adopt only quite reasonable positions in the philosophy of language."

45. Tallant, Jonathan. 2013. "A Heterodox Presentism: Kit Fine's Theory." In *New Papers on the Present: Focus on Presentism* , edited by Ciuni, Roberto, Miller, Kristie and Torrengo, Giuliano, 281-306. Munich: Philosophia Verlag.

Abstract: "Kit Fine ([Fine 2005]) has articulated a position according to which reality is fragmented. In this paper I will refer to this view as 'Heterodox Presentism'. I want to try and do two things. First, I want to try and undermine the arguments presented by Fine in favour of Heterodox Presentism and show that the view is unmotivated—in part by the fact that it fails to meet some of the standards that Fine sets for it. The second target aim is to offer some very informal and sketchy remarks as to how we might better construe the 'standard' view of realism, or 'presentism' to which Fine objects —the view that I will define here as 'only present objects exist'. As we shall see, my own view of presentism differs quite substantially from this pithy slogan.

46. Burgess, John P. 2004. "Book Review: Kit Fine. *The Limits of Abstraction* . Clarendon Press, Oxford, 2002." *Notre Dame Journal of Formal Logic* :227-251.

    "Kit Fine's long article [13], introducing his distinctive take on neo-Fregeanism, has now been expanded into a short book of the same title. (For those familiar with the article version, the philosophical material from it appears as chapter 1 in the book, and the echnical material as chapters 3 and 4. According to the book's preface, "The major change is the addition of a new part on the context principle." This addition constitutes chapter 2 of the book. There is also an index of technical terms, which would have been more useful if it had been arranged alphabetically.)

    The present review of that book is divided into three parts of unequal length.

    The long introduction Section 2 surveys recent neo-Fregeanism. Then Section 3 summarizes Fine's technical contributions, which presumably are what is of primary interest for readers of the present journal. The brief conclusion Section 4 touches on more purely philosophical issues.

47. Correia, Fabrice. 2006. "Generic Essence, Objectual Essence, and Modality." *Noûs* no. 40:753-767.

    Abstract: When thinking about the notion of essence or of an essential feature, philosophers typically focus on what I will call the notion of objectual essence. The main aim of this paper is to argue that beside this familiar notion stands another one, the notion of generic essence, which contrary to appearance cannot be understood in terms of the familiar notion, and which also fails to be correctly characterized by certain other accounts which naturally come to mind as well. Some of my objections to these accounts are similar to some of Kit Fine's compelling objections to the standard modal account of (objectual) essence (Fine 1994). In the light of these objections, Fine advances the view that it is metaphysical necessity which has to be understood in terms of essence, rather than the other way around, and takes essence to be unanalyzable. When formulating his view, Fine had only objectual essence in mind (or had both concepts in mind, but assumed that the generic is a special case of the objectual), and for that reason, I will argue, his account fails. I will suggest that Fineans should modify their view, and take it that metaphysical necessity is to be understood in terms of the two notions of essence—a view I myself find appealing.

    Finally, I will end up with suggesting a further move which reduces the objectual to the generic, making metaphysical necessity reducible to generic essence alone—a move with which I myself have some sympathy."

48. Asay, Jamin. 2017. "Run Aground: Kit Fine's Critique of Truthmaker Theory." *The Philosophical Quarterly* no. 67:443-463.

    Abstract: "Kit Fine, the leading proponent of the metaphysical project of grounding theory, has offered a number of potentially

devastating objections to truthmaker theory, the branch of metaphysics dedicated to exploring the ontological grounds for truths. In this paper, I show what presuppositions about truthmaker theory Fine's objections are based upon, and why they are false. I discuss four objections that Fine raises, and demonstrate how truthmaker theorists may respond to them. I then showcase the positive contribution that truthmaker theory can make to metaphysics, including its ability to speak to a core metaphysical topic (the ontological grounds for truths) that Fine's approach to grounding must ultimately remain silent on. I conclude by exploring what I take to be the best option when it comes to understanding how truthmaking and grounding fit together."

49. Shapiro, Stewart. 2004. "The Nature and Limits of Abstraction." *Philosophical Quarterly* no. 54:166-174.

    "To what extent can abstraction principles serve as a foundation for a branch of mathematics? Like logicism, neo-logicism is an epistemological enterprise. The neo-logicist claims that basic arithmetic principles can become known on the basis of a derivation from Hume's principle. But of course the epistemic status of the conclusion of a deduction is closely tied to the status of its premises. Thus one key batch of philosophical issues concerns the epistemic status of acceptable abstraction principles, like Hume's principle. Are they analytic, or otherwise knowable a priori? Fine explores a number of options, and finds them wanting, some more so than others.

    One natural possibility is to think of Hume's principle as a definition. But definitions come in many flavours. An 'orthodox' definition is a linguistic device to identify an item - object, property, function, etc. - which is already in the range of the bound variables of the language or theory in use. There are two types of orthodox definitions. An explicit definition stipulates that a new linguistic term is to be equivalent to a given expression. Abstraction principles do not have the form of explicit definitions. For example, Hume's principle does not provide a single expression that is equivalent to the 'number of' operator." (p. 168)

(...)

"There is gold in these pages, but it is often difficult to mine. The book contains a number of annoying typographical and other minor errors. In most (but not all) cases, I was able to figure out what was meant, sometimes with effort. Part of the difficulty in reading this book can be traced to the fertile mind of its author. Fine explores many highways, byways and alleyways. For example, the philosophical material deals with intensional and extensional equivalence and with abstractions whose relations are contingent as well as necessary. On several occasions, distinctions are made and discussed for a while, and then dropped, sometimes with a remark that it does not matter. On the technical side, the book deals with both standard models and non-standard Henkin models. The play with predominantly logical abstractions is a result of Fine's admirable desire for his results to be as strong as possible, but the extra detail required for this introduces a wealth of intricacy that will challenge all but a diligent reader. The second half of the book is full of new technical terms and abbreviations, and it is easy to get lost in the linguistic jungle. The only help the reader gets in this regard is an 'index of first occurrence of formal symbols and definitions'. Unfortunately, this is arranged in the order in which these terms occur in the book, not in alphabetical order. So the reader who needs to look up a forgotten notion or symbol must look through seven entire columns of terms.

That said, this is a deep and penetrating book. It should be required reading for anyone with more than a casual interest in neo-logicism, or abstraction principles generally. No one can claim to be an expert on these philosophical and logical matters until they have mastered the arguments and ideas contained in this work." (pp. 173-174)

50. Wildman, Nathan. 2013. "Modality, Sparsity, and Essence." *Philosophical Quarterly* no. 63:760-782.

    Abstract: "Rather infamously, Kit Fine provided a series of counter-examples which purport to show that attempts to understand essence in terms of metaphysical necessity are

‘fundamentally misguided’. Here, my aim is to put forward a new version of modalism that is, I argue, immune to Fine's counter-examples. The core of this new modalist account is a sparseness restriction, such that an object's essential properties are those sparse properties it has in every world in which it exists. After first motivating this sparseness restriction, I proceed to show how the resulting sparse modalism circumvents Fine's original counter-examples. After dismissing a potential problem concerning the membership relation, I conclude that, as at least one form of modalism is viable, the project of understanding essence in terms of metaphysical necessity is not so fundamentally misguided after all."

51. Forbes, Graeme. 2008. "Critical Review of Kit Fine’s ' *Modality and Tense* '." *The Philosophical Review* no. 117:275-287.

    "In this critical review I discuss the main themes of the papers in Kit Fine's *Modality and Tense: Philosophical Papers* . These themes are that modal operators are intelligible in their own right and that actualist quantifiers are to be taken as basic with respect to possibilist quantifiers. I also discuss a previously unpublished paper of Fine's on modality and existence."

53. King, Jeffrey C. 1991. "Instantial Terms, Anaphora and Arbitrary Objects." *Philosophical Studies* :239-265.

    In recent work, Kit Fine has sought to resurrect the view that variables in mathematics refer to indefinite or, as he calls them, arbitrary objects. (3) Indeed Fine holds that instantial terms figuring in universal generalization and existential instantiation in systems of natural deduction, and some anaphoric pronouns in natural languages, refer to arbitrary objects as well. As against this, I intend to argue that the arbitrary objects account,

like the theories of indefinite numbers that preceded it, obscures rather than highlights the distinctive features of the various expressions it claims to handle; and that there is another view of the semantics of these expressions which is preferable to the arbitrary objects account. (4)

The plan of the present essay is first, to sketch Fine's theory of arbitrary objects; second, to sketch an alternative to Fine's account; third, to argue that Fine's arguments in support of arbitrary object theory also support the alternative; and finally, to argue that this alternative is preferable to arbitrary object theory." (p. 240)

(3) See 'A Defence of Arbitrary Objects' (henceforth, DAO), *Proceedings of the Aristotelian Society* Supplementary Volume 57, 1983, pp. 55-77; 'Natural Deduction and Arbitrary Objects' (henceforth, NDAO), *Journal of Philosophical Logic* 14 (1985) 57-107; and *Reasoning with Arbitrary Objects* Aristotelian Society Series Volume 3 (henceforth, RAO), Basil Blackwell, Oxford, 1985.

It may seem provincial of me to limit my attention to Fine s view and the alternative I intend to discuss, given the existence of sophisticated theories of anaphoric pronouns such as that outlined in Hans Kamp's 'A Theory of Truth and Semantic Representation' (in *Formal Methods in the Study of Language* , J. Groenendijk, T. Janssen, M. Stockhof (eds.), Mathematisch Centrum, Amsterdam, 1981, pp. 277-322). But Kamp's theory is incapable of handling much of the data that is at issue here. For example, that theory is incapable of handling the anaphoric pronoun in the following discourse

Every female professor has a computer. She is financially responsible for it.

(I intend 'a computer' to have narrow scope with respect to 'Every female professor').

Kamp's rules of DRS [Discourse Representation Theory] construction prevent the construction of what Kamp calls a complete DRS for this discourse; and one must construct a complete DRS for a discourse for Kamp's semantics to handle

the discourse. (In particular, Kamp's rule CR3 (p. 311) prevents substituting the "discourse referent" introduced by the processing of 'a computer' for 'it' in the second sentence, in effect preventing anaphoric connection between 'it' and 'a computer'; similarly for 'Every female professor' and' 'she'.) More importantly, even if the rules were changed in order to allow the construction of a complete DRS for this discourse, the semantics would not come out right. For the value of the pronoun 'it' in the second sentence depends on the value of the pronoun 'She' in the sense that the truth of the sentence requires that for any female professor we choose (value of 'She') there must be a computer (value of 'it') such that the professor is financially responsible for the computer. Kamp's semantics does not include a device for keeping track of such dependence between the values of pronouns.

This lack prevents Kamp's theory from handling instantial terms in natural deduction and English arguments, and variables in mathematics as well. But this is just the sort of data that is the subject of this essay.

54. Shapiro, Stewart. 2005. "Sets and Abstracts – Discussion." *Philosophical Studies* no. 122:315-322.

"Kit Fine's *The Limits of Abstraction* (2002) is loaded with interesting and important model-theoretic results about abstraction principles. I propose to explore the bearing of these and related results on the philosophical goals of neo-logicism. I presuppose familiarity with the main themes of the book, at least as outlined in the précis published here.(1) Section 1 below analyzes particular results concerning abstraction principles, indicating consequences for acceptability of the neo-logicist program, at least as that program is articulated in the Fine study. Section 2 explores the role of set-theoretic meta-theory generally in foundational programs like that of neo-logicism (and logicism). What is an advocate of neo-logicism, or a neutral outsider, to make of the whole enterprise of model theory as based on set theory? What is a mathematician watching the neo-logicist development from the outside to make of neo-logicism?" (p. 315)

(1) K. Fine, Precis [of " *The Limits of Abstraction"*], *Philosophical Studies* , 122, 2005, pp. 305-313.

55. Tappenden, Jamie. 2005. "On Kit Fine's ' *The Limits of Abstraction'* – Discussion." *Philosophical Studies* no. 122:349-366.

    "The best place to begin these comments is to say that I found this to be a wonderful book - genuinely thrilling to read. It is a challenge for me to find a contribution that hasn't been already advanced many times, since the core topics - reference to abstract objects, say, or impredicativity, to choose two among many - have received so much intense attention in recent decades. I'll try not to just repeat arguments that I already know are in the literature. Also, since many other people are in a better position than I am to comment on the technical side of the general theory of abstraction. I will refrain from comment, except to indicate my enthusiasm. Looking to a general account rather than remaining content with *ad hoc* justifications of this or that abstraction principle is clearly a crucial step to understanding the issues. Finally. I will have little that is critical to say, because I'm in broad agreement with those of the central reflections in *The Limits of Abstraction* on which I may have something novel to contribute. (1)" (p. 349)

    (1) This is not to say I agree across the board, only that those disagreements I have – on impredicativity, for example – are for reasons that are completely unoriginal.

56. Weir, Alan. 2005. "On Kit Fine's ' *The Limits of Abstraction'* – Discussion." *Philosophical Studies* no. 122:333-348.

    "Kit Fine's *The Limits of Abstraction* is a magisterial study of the philosophical and technical issues raised by the neo-Fregean or neo-logicist project of founding mathematics on abstraction principles. The current interest in neo-logicism was largely generated by Crispin Wright, in his *Frege's Conception of Numbers as Objects* , and carried forward by Wright and others such as Bob Hale and Neil Tennant. Whatever one thinks of the philosophical plausibility of the project, it has been fortunate to attract the attention of superb logicians such as George Boolos and now Kit Fine, who have unearthed a

wealth of interesting mathematical logic from its technical foundations.

Fine writes not as a committed, card-carrying neo-Fregean (see, for example, p. 46) but more as a sympathetic bystander concernedt o see how much light can be cast on mathematics from that perspective. This discussion, then, is not a critical review of Fine's book; rather I want to ask whether his work, in particular his 'General Theory of Abstraction', can be used by neo-Fregeans to rescue themselves from objections which have been made to their position." (p. 333)

57. Forbes, Graeme. 1993. "But *a* Was Arbitrary...." *Philosophical Topics* no. 21:21-34.

    “I offer a philosophical defense of Gentzen-style quantifier rules which explains why they are sound without employing any such notion as “arbitrary name” or “arbitrary choice”. I argue that while Fine’s arbitrary object semantics directly justifies reasoning in which we seem to appeal to arbitrary objects, a parallel with standard vs. non-standard analysis, in which arbitrary objects are like infinitesimals, suggests that the Gentzen approach is more fundamental.”

58. "Book Symposium - Kit Fine, *Semantic Relationism* ." 2010. *Philosophy and Phenomenological Research* no. 81.

    Scott Soames: Coordination problems 464; Kit Fine: Comments on Scott Soames ”Coordination Problems’ 475; Krista Lawlor: Varieties of Coreference 485; Kit Fine: Reply to Lawlor’s ‘Varieties of Coreference’ 496; Paul Hovda: Semantics as Information about Semantic Values 502; Kit Fine: Comments on Paul Hovda’s ‘Semantics as Information About Semantics Values’ 511-518.

59. Hovda, Paul. 2010. "Semantics as Information about Semantic Values." *Philosophy and Phenomenological Research* no. 81:502-510.

    Abstract: "I suggest that the core ideas of Kit Fine’s *Semantic Relationism* are the notion of semantic requirement and the notion of manifest consequence, the non-classical logical relation associated with semantic requirement.

Surrounding this core are novel “relational” systems of coordinated sequences of expressions, relational (as opposed to intrinsic) semantic values, coordinated propositions, and coordinated content. I take Fine to take the periphery to be reducible to the core (but see below). I will make some primarily exegetical remarks about the two core ideas, and then make more critical remarks about the periphery. I should say that I find the book, as a whole, illuminating and, for the most part, convincing. I hesitantly suggest that the core constitutes an important and novel model for thinking about semantics (and representation in general), while the periphery might result from an attempt to force the new model into the old mold."

60. Lawlor, Krista. 2010. "Varieties of Coreference." *Philosophy and Phenomenological Research* no. 81:485-495.

    Conclusion: "Does a comprehensive theory of language and cognition require primitive semantic relations? Fine thinks so, and I agree. Will incorporating primitive semantic relations have the result that traditional semantics will need to be dramatically re-written? Again, plausibly Yes—our understanding of compositionality, to take one instance, may have to be more subtle. Is strict coreference the right primitive in such a comprehensive theory? No, I think not—the semantic pro-form is a better primitive, because it affords a more general theory.

    Naturally I’ve pressed criticisms here, but I greatly appreciate this book. We have Fine’s work to thank for turning a powerful spotlight on coreference phenomena, illuminating how central they are in thought and language, and forcing us to think harder about how to understand them." (p. 495)

61. Sider, Ted. 2013. "Replies to Dorr, Fine, and Hirsch." *Philosophy and Phenomenological Research* no. 87:733-754.

    Reply to Kit Fine, *Fundamental Truth and Fundamental Terms* , (2013).

    "Kit Fine’s paper raises important and difficult issues about my approach to the metaphysics of fundamentality. In chapters 7

and 8 (*) I examined certain subtle differences between my approach and his. Our approaches are kindred because they share the assumption that fundamentality-theoretic concepts are not to be defined modally, and that some such concepts are themselves to be adopted as conceptually primitive. (1) But they differ over which concepts are to be adopted, and over how those concepts behave."

(*) of Ted Sider, *Writing the Book of the World* , New York: Oxford University Press, 2011.

(1) This is not to say that all the approaches regard the concepts as *metaphysically* primitive.

62. Soames, Scott. 2010. "Coordination problems." *Philosophy and Phenomenological Research* no. 81:465-474.

"Although 'Rxx' and 'Rxy' are both applications of a two-place predicate to a pair of terms, 'Rxx' resembles a one-place predicate in that all one needs to evaluate it is an assignment to 'x'. A similar point applies

to the sequences 'Fx', 'Gx' and 'Fx', 'Gy' – even though neither is a one-place predicate. Kit Fine's semantic relationism aims to extract a common idea uniting these comparisons, and to use it to provide a Millian solution to Frege's Puzzle." (p. 463)

63. Deng, Natalja. 2013. "Fine's Mctaggart, Temporal Passage, and the A versus B-Debate." *Ratio* no. 26:19-34.

Abstract: "I offer an interpretation and a partial defense of Kit Fine's 'Argument from Passage', which is situated within his reconstruction of McTaggart's paradox. Fine argues that existing A-theoretic approaches to passage are no more dynamic, i.e. capture passage no better, than the B-theory. I argue that this comparative claim is correct. Our intuitive picture of passage, which inclines us towards A-theories, suggests more than coherent A-theories can deliver. In Finean terms, the picture requires not only Realism about tensed facts, but also Neutrality, i.e. the tensed facts not being 'oriented towards' one privileged time. However unlike Fine, and unlike others who advance McTaggartian arguments, I take McTaggart's paradox to indicate neither the need for a more

dynamic theory of passage nor that time does not pass. A more dynamic theory is not to be had: Fine's ‘non-standard realism’ amounts to no more than a conceptual gesture. But instead of concluding that time does not pass, we should conclude that theories of passage cannot deliver the dynamicity of our intuitive picture. For this reason, a B-theoretic account of passage that simply identifies passage with the succession of times is a serious contender."

64. Gorman, Michael. 2005. "The Essential and the Accidental." *Ratio* no. 18:276-289.

Abstract: "The distinction between the essential and the accidental is nearly always understood in modal terms. After criticizing some recent writings by Kit Fine that question that understanding, I develop a theory according to which whether a given feature of a thing is essential turns on whether it is explained by other features of that thing. The theory differs from the modal view by leaving room for features that are accidental even though their bearers cannot exist without them. The theory has the additional advantage of being open to the results of scientific theory."

" Fine tries to explain essence in terms of definition but proceeds as if we already know the real definitions of things. I propose that we travel in the opposite direction and say that a good definition of something is a statement of its essence, i.e., a statement of its fundamental characteristic(s). In other words, we first inquire into a thing’s essence, and then, once we know its essence, we can define it. If we do not yet know a thing’s essence, then we are not able to state its real definition, although we might be able to formulate a substitute by invoking some necessary accident that all and only things of that type possess. Such substitutes can be extremely useful. For example, suppose we become convinced that a hydrogen atom’s having exactly one proton is explained by some other fact about it, while being unsure what that other fact might be. In such a situation we would be unsure of the definition of hydrogen, but we would still be able to make a lot of progress investigating the characteristics of ‘atoms with exactly one proton’.(22)" (p. 289)

(22) On substitutes for definitions see Aquinas, *Summa theologiae* I, q. 29, a. 1, ad 3. Oderberg connects essence with definition and also makes a point closely related to my remarks about substitutes, namely, that a grasp of proper accidents is the best means to grasping something's essence; see 'How to Win Essence Back', pp. 36-8, 40.

65. deRosset, Louis. 2014. "On Weak Ground." *Review of Symbolic Logic* no. 7:713-744.

Abstract: "Though the study of grounding is still in the early stages, Kit Fine, in "The Pure Logic of Ground", has made a seminal attempt at formalization. Formalization of this sort is supposed to bring clarity and precision to our theorizing, as it has to the study of other metaphysically important phenomena, like modality and vagueness. Unfortunately, as I will argue, Fine ties the formal treatment of grounding to the obscure notion of a weak ground. The obscurity of weak ground, together with its centrality in Fine's system, threatens to undermine the extent to which this formalization offers clarity and precision. In this paper, I show how to overcome this problem. I describe a system, the logic of strict ground (LSG) and demonstrate its adequacy; I specify a translation scheme for interpreting Fine's weak grounding claims; I show that the interpretation verifies all of the principles of Fine's system; and I show that derivability in Fine's system can be exactly characterized in terms of derivability in LSG. I conclude that Fine's system is reducible to LSG."

"Essentialism as applied to individuals is the claim that for at least some individuals there are properties that those

individuals possess essentially. What it is to possess a property essentially is a matter of debate. To possess a property essentially is often taken to be akin to possessing a property necessarily, but stronger – although this is not a feature of Aristotle's essentialism, according to which essential properties are those properties a thing could not lose without ceasing to exist. Kit Fine (1994) takes essential properties to be those that an object has in virtue of its identity, while other essentialists refer (as Fine also does) to the nature of an object as the source of its essential properties.

It is sometimes important to distinguish the essential properties of a thing and the "full" essence of a thing. The latter is the set of the essential properties of a thing, when that set necessarily suffi ces to determine the thing's identity. One might hold that something has essential properties without agreeing that it has an identity-determining essence.

(...)

"In this chapter I shall fi rst outline certain claims and arguments concerning essentialism concerning individuals (second section). I shall then (third section) introduce the notion of a natural kind in more detail before discussing natural kind essentialism (fourth section)." (pp. 497-498)

Abstract: "In 1985, i n his book *Reasoning with Arbitrary Objects* , Kit Fine observed and stressed three, in his opinion, important differences between A-objects and Skolem functions. The present paper rests on one of them. According to Fine, there is some kind of dependence relationship between objects that cannot properly be represented by any function. We will

analyze this claim from the perspective of natural language, and discuss the improvement that the use of arbitrary objects seemingly provides over Skolem functions in dealing with dependence."

   "This Introduction to Brentano' is primarily aimed at conceptual interpretation even though it has been written with scrupulous regard to the texts and sets out its topics according to their chronological development. I have concerned myself at length with historical questions on other occasion, as when

editing the Italian versions of the three volumes of Brentano's Psychologies published by Laterza in 1997. Again for Laterza, and in accompaniment to the Psychologies I have written a short *Introduzione a Brentano* (Introduction to Brentano) of which this book is the development.

Before these publications, I have sought to outline the origin and influence of the theses put forward by the school of Brentano, and subsequently those of the school of Meinong with colleagues (L. Albertazzi et. al. ed., The School of Franz Brentano, Dordrecht, Kluwer 1996, and L. Albertazzi et. al. ed., *The School of Alexius Meinong*, Aldershot, Ashgate, 2001).

I have concentrated on these matters long enough to realize that it is still premature to attempt an exhaustive monograph on Brentano. Apart from the few texts published by Brentano during his lifetime, his writings -- and especially those published posthumously by his pupils -- are in a parlous state. And at the moment there seems to be no way out of the impasse." p. 1.

Essays

1. Albertazzi, Liliana. 1992. "Is There a Transcendental Object?" In *Theories of Objects: Meinong and Twardowski*, edited by Pasniczek, Jacek, 26-44. Lublin: Wydawnictvo Uniwersytetu Marii Curie-Sklodoskiej.

   "Twardowski's ontology is to be listed among the jungle of ontologies which seem to be in fashion in contemporary philosophy. It has in common with Meinong's *Gegenstandstheorie* the description and definition of objects. But two are peculiar to Twardowski's ontology: the object in general and the general object. This stems from Twardowski's Kantian heritage and has to be related to a general Wolffian influence on the ontology of the Brentanists."

2. ———. 1995. "Forms of Completion." *Grazer Philosophische Studien* no. 50:321-340.

   "The essay underlines the complementarity between theory and experimentation as a characteristic feature of the Meinong-school. In particular, it deals with the nucleus of a theory of

presentation implicit in the theory of production. In fact, on the basis of Benussi's experimental results, I distinguish between presentation and representation, relatively to the various phases of the moment-now as the qualitative primitive of cognition. This result has various consequences which shed light on the act-side: it shows that the production relation relates to the act and not to the produced object, clarifying some difficulties concerning the nature of ideal objects in Meinong's ontology; that the psychological act granter the objects of knowing on the basis of cognitive determinants which are assimilative determinants and determinants of connection. These cognitive aspects of the act are indeed forms of completions of the known objects. Endly, the essay deals with the a-modal development of Benussi's theory of the cognitive aspects of the act as performed by the Italian Gestaltist Gaetano Kanizsa."

   "We owe the concept of formal ontology to Husserl, who called it the 'formal theory' of objects. However, the concept of formal as used by Husserl in his definition should not be understood in the conventional sense, since in his thought 'formal' is equivalent to 'categorial'; it is closely connected with the structures of the intentional acts and, as we shall see, has morphodynamic implications.

In contemporary philosophy, formal ontology has been developed in two principal ways. The first approach has been to study formal ontology as a part of ontology, and to analyse it using the tools and approach of formal logic: from this point of view formal ontology examines the logical features of predication and of the various theories of universals. The use of the specific paradigm of set theory applied to predication, moreover, conditions its interpretation. The second line of development returns to its Husserlian origins and analyses the fundamental categories of object, state of affairs, part, whole, and so forth, as well as the relations between parts and the whole and their laws of dependence - once all material concepts have been replaced by their correlative formal concepts relative to the pure 'something'. This kind of analysis does not deal with the problem of the relationship between formal ontology and material ontology." p. 199. (Notes omitted)

"A not up-to-date premise.

Can metaphysics be a science? The question has long been dismissed as obscurantist and in bad taste, as well as being obfuscatory, impossible to frame and methodologically inadequate. And yet it is an entirely legitimate question when stated in the following simple terms:

(i) what *exists?*

(ii) what are the best methods with which to *describe it?*

and, subordinately, why do things sometimes *appear* differently from what they *are?*

Questions of this kind stem from an empirical and experimental vocation.

The first step to take in analysis of an "elementary doctrine of the components of experience", as Kant put it, is an apparently simple one. One asks oneself, in order to remain on certain ground, what it is that exists here and now in the present moment.

A first answer concerns those apparently indubitable situations in which *something* - that is, *objects* of some kind - are seen, felt, smelt or touched. Yet an immediate certainty based on sounds, colours and things that are experienced apparently without mediations and usually with an emotional connotation - the bold red of a dress, the strident sound of violently applied brakes, the glittering gold of the decoration on the facade of a Viennese building, the pale moon that fades with the morning - at once raises the problem of the *terms used to describe it,* since these are extremely difficult to manipulate. *Here, now, something, object,* and so on, but also and more simply *colour, sound, emotion,* etc., are all terms which are widely abused and apparently bankrupt if analysed on the basis of linguistic definitions. And as for *seeing, feeling, hearing,* etc., these are veritable speculative pitfalls for the unwary. Are they acts? If they are, on what do they rest? Do they have some sort of substratum or are they wholly unconnected? And then, what is their origin? Metaphysics thus seems to oscillate perilously between the mute *deixis ad oculos* of the moment-now and the atemporality of abstract definitions of terms such as *be, exist, become,* and so on.

Not surprisingly, therefore, several philosophers have given up in the attempt and devoted themselves to the much more reassuring theories of epistemological *models* and logics of the existent, declaring metaphysics to be 'off limits'.

For those who persist in their empirical endeavour, the only option is to adopt a different approach: a minimalist one which analyses the *situation* to which these terms refer and their genesis in the duration. This is an essentially *descriptive*

approach; it has close ties with psychology and it is, specifically, an *experimental phenomenology*." p. 257 (Notes omitted)

Brian Cantwell Smith *On the Origins of Objects*

Introduction

Contents: Preface VIII-XII; Introduction 3; Part I. Analysis; 1. Computation 27; 2. Irreduction 77; 3. Realism 85; 4. Particularity 117; 5. Physics 137; Part II. Construction; 6. Flex & slop 191; 7. Registration -- I 213; 8. Registration -- II 243; 9. Middle distance 277; 10. Transition 315; 11. Metaphysics 317; 12. Conclusion 345; Indexes; Sections 379; Figures 383; Sidebars 385; Topics 387; Names 407; References 411.

From the back-cover: "*On the Origin of Objects* is the culmination of Brian Cantwell Smith's decade-long investigation into the philosophical and metaphysical foundations of computation, artificial intelligence, and cognitive science. Based on a sustained critique of the formal tradition that underlies the reigning views, he presents an argument for an embedded, participatory, 'irreductionist,' metaphysical alternative. Smith seeks nothing less than to revise our understanding not only of the machines we build but also of the world with which they interact.

Smith's ambitious project begins as a search for a comprehensive theory of computation, able to do empirical justice to practice and conceptual justice to the computational theory of mind. A rigorous commitment to these two criteria ultimately leads him to recommend a radical overhaul of our traditional conception of metaphysics.

Along the way, Smith offers many fascinating ideas: the distinction between particularity and individuality, the methodological notion of

an "inscription error," an argument that there are no individuals within physics, various deconstructions of the type-instance distinction, an analysis of formality as overly disconnected ("discreteness run amok"), a conception of the boundaries of objects as properties of unruly interactions between objects and subjects, an argument for the theoretical centrality of reference preservation, and a theatrical, acrobatic metaphor for the contortions involved in the preservation of reference and resultant stabilization of objects. Sidebars and diagrams throughout the book help clarify and guide Smith's highly original and compelling argument.".

From the Preface: "This is a book about metaphysics-one that attempts to do justice to the tundra, to gardening, to politics, to rock. As indicated, my path into these subjects has come through computer science, but that is mostly by the way. Although some technical material is reviewed in chapter i, computational considerations are largely set aside, in order to tell a tale about the territory into which that long exploration has led. The result is something of a metaphysical romp-occasionally riding rough-shod over turf already well explored (and well tilled) by generations of writers: from philosophy, feminism, theology, science studies, physics, poetry. Notwithstanding the germ of truth in the remark that "progress is made by stepping on the toes of giants," links with these literatures need to, and at some later point will, be forged. Nevertheless, my aim for the present text is simple: by presenting the story stripped of its computational heritage, to open up a conversation about perspectives, requirements, insights, and struggles-a conversation with others who have been led, via different routes, to this same metaphysical terrain.

To those inspired to take the trip-whether from explicit professional wrestling with such issues, or as the result of late night reservations about how to participate authentically in academic life-I hope to say two things. First: yes, it is possible to base uncompromising theoretical inquiry on alternative foundations: messier foundations, contested foundations, foundations that run closer to the wry and weathered texture of ordinary life. No one, least of all God, has decreed that intellectual rigor must (or even can) be founded on a pristine foundational atomism. Second, though, I also want to make evident just how much such a transformation costs. Politics,

creativity, ambiguity, irreverence-none of these can be grafted, at a later stage, onto a silent steel core, or even poured, like life-giving water, over inherently desiccated foundations. The whole story has to be turned upside down." p. IX-X.

From the Conclusion: "To say that this book has opened more doors than it has closed is not to say much, since anyway it is an argument against closed doors. Still, an attempt has been made to tell a coherent story, a story it will pay to review. For one thing, it is important to see how many of the desiderata laid down in the first few chapters have been met. Since I have barely scratched the surface of a positive proposal, it is also important to understand what work remains to be done. And a number of other loose ends need to be attended to, to bring even this much of an introduction to a close.

Overall, the project was to develop what I called a *successor metaphysics*, one that would honor the following pretheoretic requirements:

1. Do justice to what is right about:

a. *Constructivism*: a form of humility, or so at least I characterized it, requiring that we acknowledge our presence in, and influence on, the world around us; and

b. *Realism:* the view that adds to constructivism's claim that "we are here" an equally profound recognition that we are not all that is here, and that as a result not all of our stories are equally good.

2. Make sense of *pluralism*: the fact that knowledge is partial, perspectival, and never wholly extricable from its (infinite) embedding historical, cultural, social, material, economic and every other kind of context. The account of pluralism must:

a. Avoid devolving into *nihilism* or other forms of vacuous relativism, and in particular not be purchased at the price of (successors notions of) excellence, standards, virtue, truth, or significance; and

b. Not license radical *incommensurability*, provide an excuse to build walls, or in any other way stand in the way of interchange, communion, and struggle for common ends.

Two additional criteria were applied to how these intuitions are met:

3. Be *irreductionist* -- ideologically, scientifically, and in every other way. No category, from sociality to electron, from political power to brain, from origin myth to rationality to mathematics, including the category "human," may be given a priori pride of place, and thereby be allowed to elude contingency, struggle, and price.

4. Be nevertheless *foundational*, in such a way as to satisfy our undiminished yearning for metaphysical grounding. That is, or so at least I put it, the account must show how and what it is to be grounded *simpliciter* - without being grounded in a, for any category a.

Along the way, the account should:

5. *Reclaim* tenable, lived, work-a-day successor versions of many mainstay notions of the modernist tradition: *object, objective, true, formal, mathematical, logical, physical,* etc." (pp. 345-346)

From: Brian Cantwell Smith, *On the Origin of Objects*, Cambridge: The MIT Press 1996.

Critical judgments and B. C. Smith' replies

"Smith's work may be aligned with the situated cognition tradition due to Barwise and Perry (Situations and attitudes, 1983). This approach emphasizes the importance of context in determining meaning. The situated semanticist is inclined to begin her theory of meaning with indexicals and other radically context sensitive representations. Tokens of 'I' have very little meaning independent of how, when, where, and by whom they are used. More generally, the situated approach to cognition places significant emphasis on the contribution of the situation of the organism to that organism's cognitive processes.

Smith argues that as soon as we register the world using a system of representation, we make a set of strong assumptions about the way the world is. His task has been to show the profound consequences of this insight for the study of systems of representation.

Smith makes use of an engaging imaginative strategy to draw attention to the theoretical moves required to explain the occurrence of representation using only the resources of a representation-free

physical world. Smith urges us to consider whether we need to think in terms of objects at all. Might an ontology consisting only of Strawson's (Individuals, 1959) 'features' be sufficient? When we declare that 'It's raining' we are drawing attention to a feature (raining) without being committed to any particular object that has that feature. Smith suggests we begin by thinking of the physicist's world as populated not by objects but field-densities. This field-theoretic description can be comprehensive while admitting only of field-densities for a small range of properties (for example, gravitational fields, electromagnetic fields, etc.).

Smith suggests that the common-sense world of middle-sized objects is an achievement of our representational practices. Representation is achieved when one aspect of the mish-mash of fields is able to separate in a certain way from the rest of the mish-mash. This region, the 's-region', is (or is becoming) the subject-something that represents the world. Smith first emphasizes the distance required between the representation and the represented, and secondly the need for coordination between the two. This coordination is likened to the actions of an acrobat who dances around a stage, but keeps a torch beam focused on one spot. The torch must undergo dramatic changes in orientation to maintain its focus at one point. The intentional acrobat is similarly dynamic in keeping its intentional objects stably registered." (p. 220)

From: Hugh Clapin (ed.), *Philosophy of Mental Representation*, Oxford: Clarendon Press 2002.

"Why re-tool our ontology? If we don't, if we complacently (or opportunistically) cling to the standard inventory, we will commit what Smith calls inscription errors or pre-emptive registration: (1) a tendency for a theorist or observer, first, to write or project or impose or inscribe a set of ontological assumptions onto a computational system (onto the system itself, onto the task domain, onto the relation between the two, and so forth), and then, second, to read those assumptions or their consequences back off the system, as if that constituted an independent empirical discovery or theoretical result. (Smith, On the origin of objects 1996 p.50) Pre-emptive registration is a sort of metaphysical anachronism, back-projecting onto our vision of ultimate-or at any rate more fundamental reality a

category or assumption that is in fact the effect or artefact of some later, higher-level, more 'expensive' development." (p. 224)

Notes

(1) The term 'inscription error' is from Smith (1996). Since writing the book, Smith has shifted to using the phrase 'pre-emptive registration,' on the grounds that it is more illuminating (based on 'pre-emptive representation', from Cussins, Constructions of thought, in preparation).

From: Daniel Dennett: "Brian Cantwell Smith on Evolution, Objectivity, and Intentionality", in: Hugh Clapin (ed.), *Philosophy of Mental Representation*, Oxford: Clarendon Press 2002.

"The first remark has to do with the project of naturalizing ontology. 'Why bother?' asks Dennett. The main reason, of course, is because I believe the subject matter demands it. What ends up as a methodological commitment is grounded in an empirical claim: that the theory of ontology and the theory of representation and intentionality are about intrinsically interconnected phenomena. To study one without studying the other would be like studying time without studying space. Time is not space, of course; no one thinks they are identical. But you would not get an adequate account of either space or time by studying it on its own. So too, I believe, for representation and ontology. How things are and how we take them to be, though by no means identical, are co-constituted in intricate ways.

I might say that I haven't always believed this.(*) During the 1980s I spent a long time trying to develop a theory of representation independent of ontology. I was particularly interested in taxonomies of representational types (symbols, icons, descriptions, models, simulations, etc.)-a theory, I might say, in which isomorphisms figured. Now I didn't have the smarts to invent targets to do the work that representations couldn't do. But my fundamental problem was that I couldn't hold the ontology fixed -- couldn't stabilize it adequately-in order to develop satisfying accounts of the plethora of correspondences that held between them. I was unable to determine (except by fiat, which didn't satisfy me) which items were objects or basic elements, which were properties of those elements, and which

were relations among them. Small variations in how I registered the basic domains wreaked havoc with how I ended up classifying the representations defined over those domains. In the end I was forced to admit that the (ontological) question of whether something was an object could not be answered except with reference to the (epistemological) question of whether it was being objectified by a representing or cognizing subject. That is: my independence assumption did not work. So there is a lot of failure behind this claim that representation and ontology are parts of the same subject matter. That really is the bottom line.

So I started over, to reconstruct ontology and representation together. It is not just an exercise, at the end of which you end up with the same recognizable parts. The theory that comes out-the benefits it gives you -- are different."(*) That's not quite true. What's more accurate is that I haven't always approached the subject, in my intellectual work, from an integrated perspective. Even in graduate school, I believed that ultimately they would have to be understood together. In fact my doctoral dissertation (1982) started out as one chapter in an integrated but unwieldy metaphysical project that, at the time, I was hopelessly unprepared to complete. On the origins of objects is essentially what that project turned into." (p. 238)

From: Brian Cantwell Smith, "Reply to Dennett", in: Hugh Clapin (ed.), *Philosophy of Mental Representation*, Oxford: Clarendon Press 2002.

"The identification and re-identification of objects involves an epistemic process of abstraction over the infinitely rich (and often surpassingly messy) ur-structure of the world. Among other things, the normative character of the intentional projects that agents are engaged in, when they commit these acts of abstraction, figures in the resulting 'clumping' of the world's effectively infinite detail. To be an object is to be a region or patch of the world that is successfully abstracted -- where the issue of 'success' is tied into the normative conditions governing the dynamic project of which the act of abstraction is a constitutive part. The fundamental character of (what it is to be) an object is thus intrinsically hooked into the intentional life practices of the objectifying subject.

One more point on this topic. As a way to muster support for simply availing ourselves of 'common-sense ontology', Dennett says 'Look, why not just assume sub-atomic particles and tables and mountains and galaxies, in the way that science does?' This leads me to mention a radical thesis that I hold, although I can't give it much defence here: namely, that science may not be committed to objects at all. Consider: an amoeba splits. Biology doesn't care about the individuals in the situation: whether one amoeba died and two new ones were born; or whether we now have a spatial distribution of unitary amoeba-ness; or whether one of the two emerging amoebae is the original one, and the other one is new; or any other possibility. Another example: in California I own an ancient redwood tree that has clumps of very substantial shoots (some as much as 50 feet high) sprouting around its base. How many redwood trees are there? Science doesn't know, and science doesn't care. Similar conclusions hold for fog, for the units of selection, for a myriad other examples. What this leads me to believe is that scientific laws (like animals) may in fact deal only in features; and that the objects we think of as constitutive of science may merely be simplifying epistemic devices that allow humans to calculate. Objects in science, that is, are in my view properly understood as part of the epistemic apparatus involved in the conduct of science as an intellectual activity (on a par with mathematical models); they are not ontological commitments of the theory as a whole.

Put it this way: ontology and abstraction need naturalizing as much as meaning, semantics, and content. Assuming a 'standard ontological inventory' for purposes of giving a naturalistic account of intentionality, as Dennett suggests, is thus a doomed project: it is viciously circular. Think about how appalled we would be (or anyway naturalistically unsatisfied) if someone were to propose a theory of representation that dined out on intentional notions, as if they were freely available. The naturalistic challenge is to explain intentionality without viciously presuming intentionality. A similar moral holds for ontology, in my view. Because ontological categories are in part intentionally constituted, attempting to explain representation while dining out on ontology is, for analogous reasons, fatally circular." (pp. 241-242, notes omitted)

2. ———. 1986. "Varieties of Self-Reference." In *Theoretical Aspects of Rationality and Knowledge. Proceedings of the 1986 Conference on Theoretical Aspects of Reasoning About Knowledge*, edited by Halpern, Joseph Y., 19-43. San Francisco: Morgan Kaufmann Publishers Inc.

   Abstract: "The significance of any system of explicit representation depends not only on the immediate properties of its representational structures, but also on two aspects of the attendant circumstances: implicit relations among, and processes defined over, those individual representations, and larger circumstances in the world in which the whole representational system is embedded. This relativity of representation to circumstance facilitates local inference, and enables representation to connect with action, but it also limits expressive power, blocks generalisation, and inhibits communication. Thus there seems to be an inherent tension between the effectiveness of located action and the detachment of general-purpose reasoning.

   It is argued that various mechanisms of causally-connected self-reference enable a system to transcend the apparent tension, and partially escape the confines of circumstantial relativity. As well as examining self-reference in general, the paper shows how a variety of particular self-referential mechanisms --- autonymy, introspection, and reflection --- provide the means to overcome specific kinds of implicit relativity. These mechanisms are based on distinct notions of self: self as unity, self as complex system, self as independent agent. Their power derives from their ability to render explicit

what would otherwise be implicit, and implicit what would otherwise be explicit, all the while maintaining causal connection between the two. Without this causal connection, a system would either be inexorably parochial, or else remain entirely disconnected from its subject matter. When appropriately connected, however, a self-referential system can move plastically back and forth between local effectiveness and detached generality."

History of Truth: *Aletheia* and Related Terms in Ancient Greek

Introduction

"Aristotle defines truth for classical philosophy: 'to say of what is that it is, and of what is not that it is not, is true.' (*Metaphysics* 1011b) This seems simple, but it is important to see that it is not. The formula synthesizes three distinct and in no way obvious or unobjectionable assumptions, assumptions which prove decisive for the career of truth in philosophy.

First, the priority of nature over language, culture, or the effects of historical experience. One can say of what is that it is just in case there exists a what which is there, present, with an identity, form, or nature of its own.

Second, the idea that truth is a kind of sameness, falsity a difference, between what is said and what there is. In another formula Aristotle says, 'he who thinks the separated to be separated and the combined to be combined has the truth, while he whose thought is in a state contrary to the objects is in error' (1051b). To be true, what you think separated must be what is separated-that is, they must be the same (the same form or *eidos*). To accommodate the priority of nature, however, truth has to be a secondary sort of sameness: according to the classical metaphor, the imitation of original by copy. It is up to us to copy Nature's originals, whose identity and existence are determined by causes prior to and independent of local convention. Thus a third feature of classical truth: the secondary and derivative character of the signs by which truth is symbolized and communicated. Classical truth subordinates the being (the existence

and identity) of signs (linguistic or otherwise) to the natural, physical, finally given presence of the non-signs they stand for." (pp. 9-10)

Heidegger remarks that 'in ontological problematic, being and truth have from time immemorial been brought together if not entirely identified (*Sein und Zeit*, 228). He thinks this is a kind of hint. There is, however, reason to think it is an originally meaningless accident of historical grammar. To be is spoken in many ways, but for Aristotle 'it is obvious that of these the what-something-is, which signifies the substance, is the first' (1028a). In a study of the Greek verb 'be' (*einai*), Charles Kahn shows the priority of its use as a predicating copula and the corresponding insignificance of the difference between existing and not existing. 'Both of them,' he writes of Plato and Aristotle, 'systematically subordinate the notion of existence to predication, and both tend to express the former by means of the latter. In their view to be is to be a definite kind of thing.' In contrast to what something is, the factor of existing, if it appears at all, appears secondary and of no distinct significance. For both, 'existence is always *einai ti*, being something or other, being something definite. There is no concept of existence as such.' This is not to say that Aristotle, for instance, is oblivious of the difference between what a thing is and its existence. Joseph Owens observes, 'Aristotle does not for an instant deny existence. He readily admits it in Being *per accidens*. But he does not seem even to suspect that it is an act worthy of any special consideration, or that it is capable of philosophical treatment.' (1) Kahn also describes a so-called veridical use of the Greek 'be' according to which it 'must be translated by 'is true,' 'is so,' 'is the case,' or by some equivalent phrase.' He remarks that 'instead of existence ... it was another use of to be that gave Parmenides and Plato their philosophical starting point: the veridical use of esti and on for 'the facts' that a true statement must convey. Thus the Greek concept of Being takes its rise from ... this notion of what is as whatever distinguishes truth from falsehood ... doctrines of Being first arose in Greece in connection with the question: what must reality be like for knowledge and informative discourse to be possible and for statements and beliefs of the form X is Y to be true?' To ask what reality must be like for sentences to be true implies that truth in sentences is their being like what is. Kahn writes, 'the pre-

philosophic conception of truth in Greek ... involves some kind of correlation or fit between what is said or thought, on one side, and what is or what is the case or the way things are on the other side.' As veridical, the Greek esti 'poses a relation between a given descriptive content and the world to which it refers or which it purports to describe ... truth depends on some point of similarity or agreement between the two.' Truth, in Greek, is the virtue of a discourse that subordinates itself to what is, assuming second hand the same form as the beings whose being makes the discourse true. 'If we bear in mind the structure of the veridical use of the verb, we will easily see how the philosophers' interest in knowledge and truth, taken together with this use of 'to be,' immediately leads to the concept of Being as ... the facts that make true statements true.' (2)" (pp. 14-15)

From: Allen Barry, *Truth in Philosophy*. Cambridge: Harvard University Press 1993 (notes abbreviated).

"Our question is: how is truth related positively to historicity? Our guiding suggestion is that such an investigation itself needs to be conducted in a historical manner, by working through the generation of our present ways of thinking about truth. To propose this way of investigating the topic of truth and historicity is, however, to be

brought face-to-face with a recurring problem. For straight away the topic of our investigation seems to pose a dilemma for us at the level of method.

On the one hand, if we are to take our own historicity seriously, it would seem that the investigation will have to be undertaken in a historical manner; in short, to be an inquiry into the history of the idea of truth and of the idea of historicity. Yet, on the other hand, the topic of the relation of truth to historicity seems, in itself, to be a philosophical issue which a historical survey could, at best, only illustrate. Thus philosophy and history, as two different kinds of inquiry, seem to exhibit just that same polar opposition as do the ideas of truth and historicity. Accordingly, it is not surprising that the enterprise of carrying out an inquiry which is at once historical and philosophical should seem impractical. This methodological stumbling-block warrants careful pondering. (p. 7)

The historian of philosophy is operating with a consciousness different from that of the historical philosopher. The directedness of the former's thinking remains focused upon the thinkers of the past; their thoughts are what the inquiry is about. Thus, there is an inevitable epistemological 'distance' between the historian as subject and the past as object. But whoever philosophizes historically is engaged essentially in a complex act of self-consciousness. One enters into the past only to return to oneself; indeed, one recognizes elements of one's own way of thinking there in the past, and recognizes them as one's own. The historian of philosophy may be struck by flashes of self-recognition too, just as contrariwise the inquiry might lead to the revision of beliefs held now. But from the point of view of the teleology of the discipline, those results are accidental side-effects. For the historical philosopher, such outcomes are essential to the kind of self-conscious reflection engaged upon. Again, unrealized possibilities for thought forgone by past thinkers may be identified by historians of philosophy, especially by those whose procedure is hermeneutically sensitive. But for those who philosophize historically such identifications are only the first step towards the development of one's own position, in full self-consciousness, as both growing out of the inherited past and yet going beyond it." (p. 10)

From: Richard Campbell, *Truth and Historicity*, Oxford: Clarendon Press, 1992.

Alethéia in Ancient Greek

"The study of early Greek notions of truth is still dominated, fifty years later, by Heidegger's influential restatement (1) of the view (2) that *to a-lêthes* is, originally and essentially, *to mê lanthanon* -- i.e., the "unhidden" or "unforgotten". If Heidegger and his followers are correct, *alêtheia* must be a quality inherent in objects perceived or information received: a certain self-evidence, abiding clarity or memorableness (3). Against this view (though also, by implication, against those who reject altogether the correctness or relevance of the derivation from the root *lath-* (4) Bruno Snell has recently suggested (5) that the *lêthê* excluded by *a-lêtheia* is something found in persons rather than things: forgetfulness rather than hiddenness or being forgotten. A-lethes is that which is retained in the memory without any of the gaps to which such *lêthê* would give rise. (p. 7)

In this "subjective" reformulation of the established, "objective" interpretation, aletheia becomes the result of the way an original apprehension remains in the perceiving subject's memory, not an aspect of objects or information as originally apprehended. But perception or apprehension continues to be of major, if no longer central, importance. The discussion which follows accepts Snell's subjective interpretation in the main but argues for further reformulation, this time in terms of the processes of communication rather than perception: *alêtheia* is that which is involved in, or results from, a 'transmission of information that excludes *lêthê* ', whether in the form of forgetfulness, failure to notice, or ignoring (6). The semantic development thus posited, by which a word that originally meant something like "conscientious reporting" became a synonym for truth (*etymon* or *eteon* in the earliest attested Greek) has a close parallel in the transformation of Latin *accuratus* ("careful", usually of speech or writing) into English "accurate". The Greek counterpart to this development is more complex and harder to trace: *alêtheia* absorbs some of the original meaning of two other more specialized terms (*nêmertês, atrekês*) and transmits some of its own to a third (*akribês*) before finally becoming, in the mid-fifth century, the most general and important word for truth. Moreover,

the initial and terminal stages of its history are much better documented than the intervening ones. But the development in all its phases is worth an attempt at reconstruction, even if the consequences for the history of Greek thought are less spectacular here than where the Heideggerian etymology serves as a point of departure.

Snell's subjective reformulation, whether as originally presented by him or in the revised version to be offered here, removes the most 'crucial ' problem posed by its objective alternative. Hiddenness (or failure to be remembered) and its opposite are conditions which should attach to things as well as to the content of statements. Yet it is almost, exclusively to the latter that *alêthes* refers in its first two and a half centuries of attestation. A Greek may, from the very beginning, speak the truth (or "true things"), but it is not until much later that he is able to hear it (Aesch. Ag. 680), or see it (Pind. N. 7,25), or be truly good (Simonides 542,1 Page), or believe in true gods (Herodotus 2, 174, 2). And it is later still that *alêtheia* comes to refer to the external reality of which discourse and art are imitations. Other *lanthanein* derivatives -- *lathra, lathraios* (and *alastos*, if it belongs to this group)--are applied freely, at all periods of their use, to persons, things and situations; why not *alêthes* as well (7). The question becomes fairly easy to answer if *alêtheia* is taken to be, in origin, a kind of "unforgettingness", a specifically human quality and one which is most crucially and consistently important in the realm of human discourse. (p. 28)

Notes

(1) In *Sein und Zeit* 33 and 220-223. Cf., also, *Platons Lehre von der Wahrheit*, 26-33 and ' *Aletheia (Heraklit, Fragment 16)* ', 54-61.

(2) First stated by J. Classen, *Beobachtungen über den homerischen Sprachgebrauch*, Frankfurt 1867, 197 [reprint Hildesheim: Georg Olms, 1977] (*)

(3) See, most briefly, the articles in the etymological dictionaries of Frisk (s.v. *'alethês'*) and Chantraine (s.v. *'lanthanô* '), and, most exhaustively, J.-P. Levet, *Le vrai at le faux dans la pensêe grecque archaique*, Paris 1976.

(4) E.g., A. W. H. Adkins, 'Truth, Kosmos and Arete in Homer', *Classical Quarterly* 66, 1972, 6-7. Cf., also, Friedländer's suggestion (P1ato (2nd edition) vol. 1, eng. transl. New York 1958, 221 -- modified and largely abandoned in Plato (3rd edition) vol. 1, Berlin 1964, 234-236) that the word may not even be Indo-European.

(5) In *ALETHEIA, Festschrift für Ernst Siegmann* (= Wurzbiirger Jahrbücher für die Altertumswissenschaft 1, 1975), 1-18. See, especially, 14 "ἀλήθες ist das rm Gedächtnis lückenlos Festgehaltene (das in seiner Fülle hergezählt werden kann)", and 11, "... in einen bestimmten Wissens-Kontinuum nichts der Lethe anheimfallen lassen". Snell seems indebted to T. Krischer's study, ' *ETYMOΣ und ΑΛΗΘΗΣ*', Philologus 109, 1965, 161-174 for his notion of *aletheia* as the larger whole from all of whose parts the process or idea associated with the lath- root is excluded. For Krischer this idea is that of being "unnoticed" rather than "unhidden" or "forgetful", so that an alethes logos is "... der Bericht der die Dinge darstellt... ohne das dabei etwas unbemerkt bleibt" (op. cit. 167; cf. 165: "... so aussagen das nichts [dem Angeredeten] entgeht) ".

(6) As in the corresponding verbs lanthano and lethomai, the distinction between unintentional forgetting or failure to notice and intentional ignoring is not strictly observed. The meaning posited is broad enough to include both.

(7) Usage thus tells strongly against the relevance of W. Luther's contention (Wahrheit, Licht und Erkenntniss in der griechischen Philosophie bis Demokrit', *Archiv für Begriffsgeschichte* 10, 1966) that the Homeric world is one which knows "keinen Unterschied zwischen Wahrheit und Wirklichkeit" (31), and in which "die Dinge und die sie bezeichnenden Wörter noch in einem untrennbaren Wirkungszusammenhang stehen" (37). This may be true in general, and for *etymos* (text, p. 13), but not for *alêthes* . Cf. Snell (above, n. 5) 11, n. 4, and 17.

(*) [*Note added by Raul Corazzon*: The text by Johannes Classen is: "Wahr ist den Griechen das Unverhüllte, ἀ-λήθες (von λήθω, λανθανω) und die Wahrheit, ἀλήθεια, kommt den Dingen und Worten zu, in so fern sie sich unsrer Einsicht nicht entziehen." in:

Über eine hervorstechende Eigentümlichkeit der griechischen Sprache (1850), reprinted in *Beobachtungen*... cit.]

Remarks on the etymology of Alethéia

"*Aletheia* is the most important Greek counterpart of our 'truth'; *alethes* (true), *alethos* (truly) and *alethein* (to speak the truth) are related words. However, the Greek "truth-family" is much more comprehensive and consists of 14 words, among others (adjectives): *atrekes, nemertes, adolos, ortos, apseudos, etymos and etetymos*. It is characteristic that several words, including aletheia also, belonging to this variety begin with ' *a*'. The most common interpretation of this lexical phenomenon it to consider ' *a*' as a sign of privativum, that is, as a negative noun or adjective. This understanding of *aletheia* was proposed by Sextus Empiricus, Plutarch, Ohimpiodoros and the so-called *Lexicon Gudianum* in antiquity (see [Wilhelm Luther, *"Wahrheit" und "Lüge" im ältesten Griechentum* (1935), pp. 12-13; Paul Friedländer, *Platon: Seinswaheheit und Lebenswrklichkeit,* (1954) pp. 222, 375]). In our times, it was recalled by Leo Myers in his influential *Handbuch der griechischen Etymologie* (1901) and popularized by Rudolf Bultmann (see *[Der griechische und hellenistische Sprachgebrauch von ἀλήθεια,* p. 239]): "aletheia - etymologisch das Nicht(s) - *verheimlichen* - bedeutet". According to this interpretation, we should consider such words as complexes of the following structure: *a-letheia, a-trekes, a-dolos or a-pseudos*; *nemertes* can be understood in a similar way, because ' *ne*' functions as ' *a*', that is, as an indicator of a privative character. As far as the matter concerns *aletheia*, its etymology is derived as *a* + *lethe* + suffix. *Aletheia* as a noun occurred with so-called *verba dicendi*, [verbs of saying] that is, verbs like Greek counterparts of "to tell" or "to hear". So much about matters of lexicology and a simple grammar. Of course, semantic matters are much more important. Very schematically, if *V (aletheia)*, where the letter *V* stands for a *verbum dicendi*, represents an *aletheia*-context, to *V* an *aletheia* consisted in issuing a concrete sentence in the present tense about something, usually supported by direct experience, particularly seeing (see [H. Boeder, *Der frügeschichte*

Wörtgebrauch von Logos und Aletheia (1959) pp. 68-71]). Then, applications of *aletheia*-contexts were extended to past and future events. Finally, *aletheia* became an abstract noun, denoting a property of sentences (judgements, etc.)." (p. 341)

From: Jan Wolenski, *Aletheia* in Greek Thought Until Aristotle, *Annals of Pure and Applied Logic*, 127: 2005, pp. 339-360.

A synthetic overview of Alethéia in Ancient Greek

1. For many years there has been a tendency in biblical studies to over-generalize about the uses of *alétheia* and *aléthes* in classical Greek. This has been done partly with a view to drawing a clear-cut contrast between Greek and Hebraic concepts of truth. It is then argued that whilst some New Testament writers preserve the Hebraic concept, other writers, especially John, achieve a fusion of these two views. Thus R. Bultmann too readily speaks of "the Greek use" of *alétheia* as over against "the semitic use" (*Theological Dictionary of the New Testament* I 238). According to this theory, *alétheia* in classical Greek denotes truth in contrast to mere appearance, whilst in Hebrew the parallel word denotes stability or faithfulness. It is also urged that truth in Greek writers is timeless, raised above the temporal and material world. It relates only to extra-historical being. Most scholars also insist that the basic meaning of *alétheia* in classical Greek is that of unhiddenness or unveiling. These traditional claims of nineteenth- and twentieth-century biblical scholarship are valid up to a point, but can be misleading unless they are carefully qualified.

2. The traditional approach depends largely on three arguments. (a) Much is made of the etymology of *alétheia* in ancient Greek. The word is said to derive from *letho* or *lanthano*, meaning to escape notice or to cause to forget, together with Alpha privative prefix, which negates the idea. The difficulty, however, is to show that the etymology of the word played a decisive part in determining its meaning in later Greek of the classical and Hellenistic periods. Indeed, even Homer shows little evidence that the word has this special nuance.

(b) *alétheia* does indeed mean truth in contrast to mere appearance in much Greek philosophy. But the vast majority of classical Greek writers and readers were not philosophers. J. B. Skemp observes, "There is one particular vice in the theological picture (or rather, caricature) of the Greeks. They are always represented as philosophical thinkers.... Such a description of the Greeks ignores the fact that many other Greeks at all the relevant times thought differently, and that a multitude of them did not think in this systematic way at all" (*The Greeks and the Gospel*, 1964, 3-4).

(c) The notion of truth as against mere appearance and as that which belongs only to the realm of timelessness and immateriality finds strong support in Parmenides and especially in Plato. This need not be denied. Nevertheless, even within Greek philosophy itself there are other views of truth besides Plato's, for example, that of the Sophists, which Plato himself attacks, and also that of Aristotle. In these writers truth has a more positive relation to the material world.

3. (a) In Homer *alétheia* is most frequently used in contrast to the telling of a lie or to the withholding of information, e.g. "Tell me all the truth [*pasan alétheian*] whether my son is by the ship" (*Ilyad* 24, 407); "I will tell you all the truth" (*Odyssey* 11, 507). When Odysseus with cunning "spoke not the truth", he simply tells a lie (*Od*. 13, 254). Achilles set an umpire to tell the truth of a race, i.e. the state of affairs as it really was (*Il*. 23, 361). However, this is not the only meaning of *alétheia* or *alethes* in Homer. In *Il*. 12, 433 *gyne chernetis alethes* means a woman who is careful, honest, accurate, or even perhaps reliable. (b) *alétheia* usually stands in opposition to falsehood in Herodotus, Thucydides and Xenophanes. For example, the cowherd in Herodotus "tells the truth" under threat of violence (l, 116). Thucydides speaks of "the actual truth" in contrast to mere empty boasts (2, 41, 2). An oracle provides true answers to enquiries (Herodotus., l, 55). (c) This usage also persists in later Hellenistic writers. Thus Epictetus contrasts telling the truth with deceiving flatteries (*Discourse* IV, l, 6, 7). Philo writes that Moses marvelled at the delusion (*pseudos*) which the multitude had bartered for the truth (*alétheia*) (*De Vita Moses* 2, 167). The evil spies sent out to view the land prefer deceit (*apate*) to truth (*Vit. Mos*. l, 235). Josephus uses *alétheia* in several different senses.

(i) Truth is that which corresponds to the facts of the matter. Thus Jonathan did not question the truth (veracity) of David's words (*Antiquities of the Jews* 6, 225).

(ii) Truth is also proved to be such by historical events. The words of a prophet are thus proved true (*Antiquities* 2, 209); whilst in the previous passage Jonathan does not wait to see David's words proved true (*Antiquities* 6, 225). (iii) Josephus also uses *alethes* in the sense of "genuine" or "real". Thus Ahab killed the real owner (*ton alethe despoten*) of the vineyard (*Antiquities* 8, 360).

4. The use of *alethes* in Greek philosophical texts is best seen in Parmenides, the Sophists, Plato, and Aristotle. Some of Plato's uses also appear in Philo.

(a) Parmenides asks what is the nature of real being, and draws a contrast between the way of truth and the way of seeming. Change belongs only to the material world, which is the realm of mere appearance. There can be no change in what really exists (Fragment 8, 29). "What is not" is unthinkable and unknowable, but change would be the supposed movement of what is to what is not, or of what is not to what is. Hence truth, in contrast to appearance, belongs to the extra-historical realm of the changeless. That such a view occurs in Greek philosophical literature is therefore clear. What is less certain is the extent to which ordinary Greek writers shared the view of Parmenides.

(b) The Sophists clearly held a different view. In particular Protagoras refused to view the material world as mere illusion. His famous dictum that "man is the measure of all things" was not intended merely, as Plato implied, as an extreme form of relativism. He cited the example of a wind which may seem warm to one person and cool to another. It is not necessary, he urged, to say that one view is true and the other false. Each may be true for the person concerned. In this way Protagoras comes near to the modern notion of existential truth.

(c) Plato rejects this view.

(i) He replied that if "true" and "false" are only relative to the individual thinker, then as soon as someone says that the philosophy of Protagoras is false for him, it is therefore false (*Theaetetus* 171 a).

Falsehood, for Plato, is a matter of deception. It conceals reality (*ta onta*). False words, he believed, are merely a copy (*mimem*) of deception in the soul (*Republic* 2, 21, 382a-383b). Falsehood is the presentation of what is only appearance (*phantasma*). By contrast "the divine and the divinity are free from falsehood [*apseudes ... to theion*]". God is true in deed and word (*alethes en to ergo kai en logo*) and neither changes himself nor deceives others (382e). Plato thus returns to the view, earlier outlined in Parmenides, that truth stands in contrast to appearance and to change, although he goes further than Parmenides in locating it in the realm of eternal ideas.

(ii) At the same time Plato also uses *alétheia* and *alethes* in more ordinary and less metaphysical ways. Truth sometimes means simply "the facts of the matter" (*Epistles* 7, 330). *alétheia* stands in contrast to legend (*Timaeus* 22d). "Equal to equal ... because of truth" (*Legibus* 2, 668a).

(d) Aristotle takes us closest to the view of truth found in modern propositional logic. Firstly, Aristotle distinguishes between the genuine proposition, which is true-or-false, and sentences such as pleas or commands. "We call propositions only those (sentences) which have truth or falsity in them" (*On Interpretation* 4, 17a, 4). Secondly, he considers the logical conditions under which the truth of a proposition entails the denial of its contrary. If it is true to say "Socrates is well", it is therefore false to say "Socrates is ill" (*Categories* 10, 13b, 14-35). Thirdly, he argues that "the truth of a proposition consists in corresponding with facts" (*hoi logoi aletheis hosper ta pragmata*, *On Interpretation* 9, 19a, 33). The principle is said to include statements about future states of affairs (18a-b). Often, however, the actual word *alétheia* is used in its ordinary everyday sense without philosophical content. The philosopher seeks to discover "the truth" that is in the universe (*De Mundo* 4, 39la).

(e) Philo uses *alétheia* in ordinary ways, as we have seen. As a Jewish theologian he speaks of "true doctrine" (*alethes dogma*, *Legum Allegoriae* 3, 229). But as a speculative writer who has been influenced by Platonism he also contrasts truth with mere appearance: "Moses desired truth rather than appearance *[tou dokein*]" (*De Vita Moses* 1, 48). However, he also sees the truth of

God manifested in historical events, as in a quick punishment for unbelief (*Vit. Mos*. 2, 284).” pp. 874-877

Pre-philosophical Concepts of Truth in Ancient Greece

The prephilosophical usage of Alethéia

Homer

Studies:

"As scholars have often pointed out, the word *Aletheia* only occurs in the *Iliad* and the *Odyssey* in connection with verbs of saying, and its opposite is a lie or deception. Someone always tells the truth to another. Of the seventeen occurrences, (a) this triadic pattern is explicit in all but six, and in those few cases the reference to a hearer is clearly implied. Truth has to do with the reliability of what is said by one person to another.

What is not so often pointed out are some quite distinctive features of the Homeric use of Aletheia. This is not the only word Homer uses to mean truth; he has a number of other words which mean 'true', 'genuine', 'accurate', and 'precise' (*atrekes, eteos, etetumos, etumos*). These words, as adjectives or adverbs, occur freely in the midst of stories and speeches. By contrast, Aletheia occurs almost always as a noun or neuter adjective (once the cognate adverb *alethes* is used). It is the word Homer uses when he wishes to signify 'the truth'.

Furthermore, it is very revealing that the sentence, 'Then verily, child, I will tell you the truth', occurs five times in the *Odyssey* with but minor variations. (b) It is a high-sounding formula used to introduce a speech. The repetition of lines and formulaic phrases-sometimes, indeed, a number of lines-is a feature of the Homeric style. That Aletheia should occur in such a context suggests that the sentence is

one that has come down in the tradition as a ready-made formula which Homer inherited.

Again, significantly, the word often occurs in the phrase 'the whole truth' (*pasan alétheien).* (c) To tell the truth in this sense is not just to utter some sentence which is true-that is a much more modern conception. It is to give a whole account, to tell the entire narrative. So, for example, at *Iliad* 23.361, Achilles sets Phoenix as umpire to watch a chariot-race and to report back the truth. The same meaning underlies *Odyssey* 13.254, where Odysseus is about to address Athena, the daughter of Zeus, in a very fulsome account 'yet he spoke not the truth but checked the word ere it was uttered'. In many other occurrences one of the characters is entreated to tell the truth, or undertakes to do so, in relation to certain questions which have been asked. Here again, the notion is that the account given has to be complete and accurate, with nothing held back and with no deception. The Homeric notion of Aletheia which emerges from examining its uses is precisely the same, with the same force and flavour, as that enshrined in the traditional oath or solemn affirmation required of a witness in court proceedings: to tell the truth, the whole truth, and nothing but the truth.

Given this use in Homer, it appears that Aletheia is a matter of being truthful and open in one person's dealings with another, so that what is said can be taken by hearers as reliable and trustworthy. That being so, the meaning discernible in its use coincides with the etymology of the word given by most scholars, both ancient and modern. The word is generally taken to be derived from a root meaning 'to escape notice, detection'. The same root, with much the same meaning, underlies the Latin *lateo*, 'am hidden', 'remain unnoticed', from which English derives 'latent'. The word *lethe* in Greek means 'forgetfulness'. How prominent the nuance of not forgetting is taken to be in Aletheia is debatable. But from the evidence it does appear that in Homer the nuance of not hiding is strong. People speak the truth if they hide or conceal nothing from their hearers. (d)" (pp. 32-33)

Notes

(a) That is, excluding the occurrence of *aléthes* at *Iliad* 12.433, which is probably a corruption of *aletis* -- see H. J. Mette, ' *Aléthes*', in

Bruno Snell (ed.), *Lexicon des frühgriechischen Epos* (Vandenhoeck and Ruprecht, Göttingen, 1955-).

(b) *Odyssey* 3.354, 16.61, 16.226, 17.108, 22.420.

(c) e.g. in the *Odyssey* 3.354 and 16.6, (already cited) and in 11.507, 17.297, and *Iliad* 24.407.

(d) See Mourelatos, *The Route of Parmenides*, 64 ff., and C. H. Kahn, *The Verb 'Be' in Ancient Greek* (Foundations of language Suppl. Series, 16; Reidel, Dordrecht, 1973), 364 ff.

From: Richard Campbell, *Truth and Historicity*, Oxford: Clarendon Press 1992.

"The result is that the epic texts entertain an endless dialogue and conversation on all the topics of archaic Greek thought. To begin with the notion of truth in relation to the language of poetry, the *Iliad*, the *Odyssey*, and Hesiod eavesdrop on each other, the *Odyssey* teasing slightly the notion of *kleos* [glory] in the *Iliad*, the *Odyssey* providing the foil for Hesiod's attack on the poets, *gasteres oion*, "mere bellies." In the age of writers, a man as wise as Xenophanes is not content with attacking by name, author to author, the hexametric poetry of Homer and Hesiod: he goes on to quote, and he quotes by alluding to a line of the poet he is condemning. So Xenophanes fragment 36, which reads *tauta dedoxastho men eoikota tois elumoisin*, "let these things be considered to resemble truth," cannot be separated either from Hesiod *Theogony* 27 or from *Odyssey* 19.203. (10) The textual parallels between Parmenides and the *Odyssey*, as Alexander Mourelatos writes, "have been commonplace for almost a century," and several incorporations of Odyssean phrases by Parmenides' text have in recent years been shown to contain a specific set of allusive interactions. (11)

The perception that the poetic language maintains a difficult and problematic relation with truth belongs to all the texts in question, but the economy of this relation and the strategies that are devised to save the notion of truth from the contiguity of falsity are as different as are the texts.

The question of truth (*aletheia*) in relation to being (*to on*) and to language (*logos*) remains fundamental. Heidegger has elaborated

these questions in the Greek context beginning with *Iliad* 1.70, *ta t'eonta, ta t'essomena pro t'eonta*, in a famous essay, (12) where he defines being of *einai* as presencing and connects the Iliadic *ta eonta* with Anaximander's *ta eonta*. (pp. 242-243)"

Notes

(10) The resemblance between Xenophanes frag. 36 and Hesiod *Theogony* 27 is evident to some critics: see André Rivier, "*Rémarques sur les fragments 34 et 35 de Xénophane*," Revue de Philologie 30 (1956): 37-61.

From: Pietro Pucci, *Odysseus Polutropos. Intertextual readings in the Odyssey and the Iliad*, Ithaca: Cornell University Press 1987.

"*Truth* beginning with the presocratic Parmenides assumed some kind of at least proto-eidetic, non-immediate and reflected status in the Greek culture. This was not the case in Homer's texts, where how a statement "rang true" depended to a much greater extent on its traditional linguistic power than on the idiosyncratic, individual behavior of a specific character or some universalized sense of character that Aristotle was yet to create in the *Nicomachean Ethics*. Homeric truth lay in a factual *mythos* ("myth'), not a fictive *logos* ("argument"). The archaic *mythos* was defined in its factual, even artifactual, relationship to an immediately recognizable "deed" (*ergon*), not to an *ergon* that Aristotle might wish to judge, through a problematically narrated *logos*, "certainly" (*akribes*), "decorously" (*to prepon*), and ultimately universally or "absolutely" (*haplos*). Consequently, as Vico perceived in his *De Antiquissima*, for Homer fact implied truth (*verum-factum*). Vico was to attribute to the ancient Latins the different Aristotelian notion that only certainty implies truth (*verum-certum)*. So arises yet another difference linked to a common source, in this instance '"truth. Again, it suggests a shift

or skew that is central to our rhetoric and its powers of interpretation, that is, its hermeneutics". (p. 64)

"*Der Weg* (*) is an important collection of those essays that most clearly reveal Snell's insights into the idiosyncratic properties of Homeric experience. Chapter 5 ("The Development of the Notion of Truth among the Greeks") was written specifically against Heidegger false notion of archaic "Truth" and, as such, succeeds in dismissing any putative "onto-theological" essence of "Truth" from the Homeric treasure house of nonrepresentational mental activity. The chapter is a shortened version of an earlier essay entitled "ALETHEIA" (*Festschrift Ernst Siegmann* [Würzburg: Schoning 1975], 9-17) which should be read by whose interested in more Homeric examples to bolster the argument. In both pieces, as is the case in Snell's most popular work, *Die Entdeckung des Geistes*, 4th ed. (Göttingen, Vandenhoeck & Ruprecht, 1975), there lies an Aristotelian differentiation that too easily skews the cultural continuity of Homeric experience, with which we all must deal. If indeed, as Snell argues generally, mental activity moves from the concrete sense of Homeric experience to an abstract reflection of the philosophical sort, two reservations must always apply to any statement about how the Greeks or we 'think": (1) the opposition concrete/abstract is purely an Aristotelian formulation designed by him, along with his notion of particulars and universals to arrive at a "proper judgment", and (2) the philosophical penchant for an abstract lexis does not in any way minimize the continual operation of Homeric perception to the present day.

Snell defines "the three significant aspects, under which Homer sees what one later named the truth." Here, too, it is necessary to identify the Aristotelian, philosophical lexis that tends to creep into Snell's modern German prose:

alethes is that consistent, solid surety in memory (that in its fullness can be enumerated), ["Memory" in any functional sense is not found in the Homeric texts; *mnemosyne* appears as hapaxlegomenon at *Iliad* 8.181, with an imperative: *mneomosyne tis epeita pyros deioio genestho* ("then let some memory of blazing fire come about") "Fullness" and "enumeration" are, however, characteristically Homeric perceptions of experience, especially when linked to "cataloguing".]

eteon is the factual [*Tatsächliche*], an objective Being, [*ein objektiv Seiendes*] (that as such draws necessarily specific consequences, in sharp antithesis [*Gegensatz*] to Not-Being [*Nichtseienden*].

["Objective Being" suggests too strongly the *De Anima*, and Snell's argument is not convincing that at *Iliad* 2.299-300, when Odysseus asks the host to wait *ophra daomen / e eteon Kalchas manteuetai, ee kai ouki* ("that we may learn whether what Calchas foretells is true, or whether indeed it is not"), there arises the question of Being and Not-Being (Snell, *Der Weg*, 95-96). "Antithesis" or "opposition," moreover, too easily falls into some Aristotelian readings of a pre-Socratic, not entirely Homeric structure of thought. It is the relationship between *eteon* and the factual that is the insight here.]

nemertes is the Not-Falling [*Nicht-Verfehlende*] in especially the replying word (the "*Ant-Wort*"), that something factual [*ein Tatsächliches*] (*eteon*), at last come about [*trifft*], when one make inquiries about him. (Snell, *Der Weg*, 100)

It is Snell's understanding of *nemertes* as "truth" that forms a common definition of all lexical choices in Homer that attempt to express the force of the human experience. Snell's attempt to color *alethés* with a "subjective" tone over an "objective" one (*Der Weg,* 109) is probably explained by a zeal to crush Heidegger's "objective" fiction. Unfortunately, the philosophical debate tends to blur the central issue of language and human discourse that the root sense of all "truth" in Homer suggests (Cole "Archaic Truth", 27). (For distinctions among *nemertes, atrekes,* and *alethes* that Snell is unwilling to draw [*Der Weg*, 98], see Cole "Archaic Truth", 17)." (pp. 79-80)

"As we look beyond Homeric diction, however, at later stages in the history of Greek poetics, we can find evidence for the emergence of yet another word that marks speech as special -- so special that it is set apart even from *múthos*, which in such contexts then becomes in its own turn "ordinary." I mean "ordinary" only to the extent that the given opposing word becomes even more special. The word in question is *alethés* 'true' or *alétheia* 'truth'. In the diction of a fifth-century poet like Pindar, for example, this word is used in explicit opposition to the word *múthos* in contexts where true speech is being contrasted to other forms of speech that are discredited, that cannot be trusted (αλαθῆ λόγον) versus μύθοι at *Olympian* 1.29-30, μύθοις versus αλαθειαν at *Nemean* 7.23-25)." (42)

There is, to be sure, nothing post-Homeric about the actual word *alethés* 'true' or *alétheia* 'truth', or even about the concept inherent in the formation of the word, which expresses an explicit denial, by way of the negative element *a-*, of forgetting, *leth-*, and thereby an implicit affirmation of remembering, *mné-*. (43) As Martin has shown convincingly, the Homeric word *múthos* is associated with narrating from memory, (44) which he describes as the rhetorical act of recollection. (45) This speech-act of recollection, which qualifies explicitly as a *múthos* (as at *Iliad* 1.273), is the act of *mné-* 'remembering'. An ideal example is the wording of Phoenix in *Iliad* 9.527 as he introduces the story of the hero Meleagros to Achilles and the rest of the audience: μέμνημαι 'I remember [*mné-*]'.(46) The failure of any such speech-act is marked by the act of *léth-* 'forgetting' (as with λήθεαι at *Iliad* 9.259).(47)

The very concept of *aléthés* 'true' or *alétheia* 'truth' expresses the need to avoid such failure in the speech-act, the *múthos*, of recollection or narrating from memory, and Homeric diction can actually combine *aléthés* 'true' with a derivative of *múthos*, the verb *muthéomai* 'make a *múthos'*, as in the expression *alethéa muthésasthai* 'speak true things' at Iliad 6.382 (the whole speech in question is introduced as a *múthos* at 6.381). The Homeric meaning of *muthéomai* 'make a *múthos*' has all the force of *múthos* itself, as we see from this description by Martin: "When this word for speech occurs, the accompanying discourse has a formal nature, often religious or legal; full detail is laid out for the audience, or is expected

by the interlocutor in the poem; at times, a character comments on the formal qualities of the discourse labelled with this verb." (48)

Granted, then, that there is nothing post-Homeric about the actual word *aléthés* 'true' or *alétheia* 'truth'; also, that this word does not enter into opposition with *múthos* in Homeric diction. In post-Homeric traditions, however, as we have seen, for example, in the diction of Pindar, *múthos* has indeed become an opposite of *aléthés* 'true' or *alétheia* 'truth', which is now marked as being distinct from *múthos*. In the Pindaric examples that we have already considered, the word *múthos* has defaulted into a vague plural (μύθοι at *Olympian* 1.30, μύθοις at *Nemean* 7.23), representing a murky multiplicity of discredited versions against which backdrop the singular truth of *alétheia* is being highlighted in shining contrast.(49) In brief, as I have argued at length in my earlier work on such post-contexts, the meaning of *múthos* as a speech-act has thus become marginalized.(50)

There are traces of this marginalization at even earlier stages. Let us consider the expression *aléthea gerúsasthai* 'announce true things' in Hesiod *Theogony* 28, which is a formulaic variant of *aléthea muthésasthai* 'speak true things', as attested at Iliad 6.382. (51) It appears from such variations that *gerúomai* 'announce' has become the marked member in opposition to *muthéomai* 'speak', which then becomes unmarked.(52) Similarly with *aléthea muthé sasthai* 'speak true things', as attested at *Homeric Hymn to Demeter* 121, as also at *Iliad* 6.382: this formula is in turn a variant of *etétuma muthésasthai* 'speak genuine things', as attested at *Homeric Hymn to Demeter* 44. Just as *gerúomai* 'announce' has become the marked member in opposition to *muthéomai* 'speak', so also *aléthea* 'true things' has become the marked member in opposition to *etétuma* or *étuma* 'genuine things'.(53) The latter opposition is made explicit in the quoted words of the Muses themselves in Hesiod *Theogony* 27-28, where the unique truth-value of the *Theogony* itself is heralded by the goddesses as *alethéa* 'true things' (28) in opposition to a multiplicity of versions that look like *étuma* 'genuine things' but are in reality *pseúdea* 'fallacies' ('many fallacies that look like genuine things' 27). (54)

In my earlier work, I have argued at length that such variations result from a chain of differentiations setting off a single marked pan-

Hellenic version from a multiplicity of unmarked versions that are perceived as local or at least more local.(55) For now I need only emphasize that this newer concept is marked as distinct from earlier concepts that thereby default into an unmarked category. As the word *aléthes* ‘true’ or *alétheia* ‘truth’ becomes marked in opposition to mûthos, which in turn becomes unmarked in the context of such opposition, the meaning of mûthos becomes marginalized to mean something like ‘myth’ in the popular sense of the word as it is used today in referring to the opposite of ‘truth’. (pp. 122-124)

(...)

In short, the expression *aléthea gerúsasthai* ‘to herald true things’ in Theogony 28 designates not just the process of speaking something that is privileged: it explicitly marks a speech-act, an utterance with special authority. It seems to me not enough to establish that the adjective *aléthes*can be interpreted as ‘verifiable’, in the etymological sense that it negates the idea of “escape one’s consciousness,” as implicit in the root from which it is derived, *léth-* as in *léthe*‘oblivion’ and *lanthán¯o* ‘escape the consciousness of’.(57) Yes, *aléthes* conveys the idea of seeing something "for real," but there is more to it: the negation of *leth-* serves as the equivalent of the positive concept *mne-*, which as we have seen means not just 'remember' but something like 'narrate from memory'. We may recall the intuitive formulation of Jean-Pierre Vernant, who defines *mne-* as 'recover the essence of being'.(58) In ancient Greek mythical thought, such an essence is beyond sensible reality, beyond time.(59) Even more important, as Marcel Detienne has shown, ancient Greek tradition claims that this essence is controlled by the poet, master of "truth" or *alétheia*.(60)

A problem remains: *alethéa* in *Theogony* 28 is opposed not to *lethe* but to *pseúdea* 'fallacies' in the previous line. It has been argued that such an antithesis represents "a later, more rational way of thinking, where *alétheia* means 'truth'.(61) It is as if a new rationalistic opposition of *alethéa* 'true things' versus *pseúdea* 'fallacies' were superimposed on an older myth-centered opposition of *alétheia* in the sense of 'no lapse of consciousness' versus *lethe* 'lapse of consciousness', with the result that the two oppositions overlap and in fact coexist.(62) Further, it has been argued that there is overlap even between *alétheia* and *lethe*, as also between *aléthea* and *pseúdea*, to the extent that no act of remembering is free of some kind of

forgetting, no telling of the truth is free of some deception.(63) I agree that there is a thought-pattern where *mne-* in the sense of 'remember' includes an aspect of *leth-* 'forget'.(64). I disagree, however, with the notion that the adjective *alethés* and the noun *alétheia* are similarly inclusive; rather, as I have argued at length elsewhere, *alethés* and *alétheia* explicitly exclude a lapse of the mind.(65) The non-ambiguity or even absolutism of the words *alethés* and *alétheia* is a key to their denotation of a speech- act endowed with a distinctly authoritative and authorizing force." (pp. 125-127)

(57) There is an admirable survey of the semantics of *alethés*, and of various interpretations, in Cole *Archaic Truth* (1983), who resists Heidegger's formulation of an "objective" truth-value inherent in the word (the truth not "hidden" in what is perceived). Cole's own interpretation is a reformulation of earlier solutions insisting on a "subjective" truth-value (the truth not "forgotten" by the one who perceives). He suggests (p. 12) that "the forgetting excluded by *alétheia* involves primarily the process of transmission -- not the mental apprehension on which the transmission is based." Thus *alétheia* refers "not simply to non-omission of pieces of information through forgetting or failure to take notice or ignoring, but also to not forgetting from one minute to the next what was said a few minutes before, and not letting anything, said or unsaid, slip by without being mindful of its consequences and implications" (ibid.).

Hesiod

Texts:

ἴδμεν ψεύδεα πολλα᾽ λέγειν ἐτύμοισιν ὁμοι῀α,

ἴδμεν δ', εὖτ' ἐθέλωμεν, ἀληθέα γηρύσασθαι.

"we [*the Muses*] know how to say many lies as if they where true,

and when we want, we know how to speak the truth"

Hesiod's Theogony, 27-28 - Translated, with introduction, commentary, and interpretive essay by Richard S. Caldwell - Cambridge, Focus Information Group, 1987, p. 29.

Studies:

"It was customary for a Greek singer to preface his recitation with a hymn to a god, of the kind represented by the extant 'Homeric hymns'. When the *Iliad* and *Odyssey* were written down, no introductory hymn was attached to them. This might indicate that they were not at that time intended for continuous recitation, though there might be other explanations. The *Theogony* and *Works and Days*, on the other hand, both had hymns attached from the first. The *Works and Days* is introduced by a short invocation of Zeus, the *Theogony* by a much fuller hymn to the Muses. Both types are paralleled in the Homeric collection.

(...)

The hymn to the Muses begins with a description of some of their characteristic activities (dancing and singing on Helicon by night) (1-21). This leads to an account of a particular occurrence in which they were involved -- their epiphany to Hesiod himself (22-34). Then we return to their habitual activities (singing to Zeus on Olympus) (35-52)."

From: Hesiod, *Theogony*, edited with Prolegomena and Commentary by Morris L. West, Oxford: Clarendon Press 1966, p. 150.

"The cryptic words that follow have provoked floods of controversy:

We know how to compose many lies indistinguishable from things that are real;

And we know, when we wish, to pronounce things that are true. (*Theogony* 27-28)

Commentators have traditionally interpreted these enigmatic lines as Hesiod's proclamation of the truth of his song as opposed to the songs of other poets who only pronounce *pseudea polla*. Accordingly, the Muses' declaration should be understood as a polemic directed at Homer or perhaps at heroic epic in general.(38) Svenbro views Hesiod's polemic in social terms as an attack on those poets who depend on their aristocratic patrons, as opposed to Hesiod himself, who prides himself on his autonomy.(39) According to Nagy, on the other hand, Hesiod's targets are the poets who perform theogonies of only local interest, whereas his own is Panhellenic in its scope.(40) Recently, Arrighetti has proposed another interpretation of the Muses' mysterious statement: the object of Hesiod's polemics is not Homer, but his character, Odysseus, or indeed anyone like him, who may possess the ability to persuade and even enchant his audience, but who has not received from the Muses the gift of truthful song. (41)

To offer an exhaustive doxography of the Muses' enigmatic statement would lead too far afield.(42) Nevertheless, the importance of these verses for any reading of the *Theogony* requires us to grapple with their implications." (p. 58)

(...)

Aletheia, then, consists of "the truth, the whole truth, and nothing but the truth".(50) The legal terminology readily springs to mind, since *aletheia* involves a complete and veracious account of what one has witnessed. If the archaic Greek conception *of aletheia* has a far narrower range than our "truth," then the *Greek pseudos* has a wider range of meaning -- to which the Muses' assertion of the multiplicity of lies *(pseudea polla)* draws attention -- in comparison to our notion of falsehood.(51) *Pseudea* embrace not only consciously misleading statements intended to deceive, but also unwitting errors, omissions, and inaccuracies, as well as additions, embroideries, and even figurative speech. While the Muses would seem to be immune from

simple mistakes, they seem quite proud to lay claim to all other kinds of *pseudea*. (52)." (pp. 61-62)

Notes

(38) Cf Puelma (1989) 75.

(39) Svenbro (1976) 46-73. For a critique of Svenbro, see Judet de la Combe (1993) 26-28.

(40) Nagy (1990) 45 Neitzel (1980) believes lines 27 and 28 refer to other poets who composed competing but inferior accounts of the gods. Otto (1952) 51-52, while regarding the lines as Hesiod's claim for the veracity of his song, detects in the *pseudea polla* not polemic, but the "Bezauberung durch die lebensvollen Bilder der Phantasie" which are also part of the Muses domain.

(41) Arrighetti (1996) 53-60.

From: Jenny Strauss Clay, *Hesiod's Cosmos*, Cambridge: Cambridge University Press 2003.

"The beginning of the *Works and Days* with its prayerful attitude clearly differs from the hymnic note struck at the opening of the *Theogony*. Hymns can be sung even on Olympus, but prayers originate on earth. The Muses further emphasize the distance separating gods and men in the *Works and Days* by concluding their celebration of their father with the phrase: "high-thundering Zeus, who inhabits the most exalted halls" (Ζὼς ὑψιβρεμέτης, ὸς ὑπέρτατα δώματα ναίει, 8). Now suddenly, and even more abruptly, Hesiod breaks off a second time, without even the usual hymnic salutation (χαίρε) to Zeus:

δίκῃ δ' ἴθυνε θέμιστας τύνη· ἐγω᾽ δέ κε, Πέρση, ἐτήτυμα μυθησαίμην.

Yours to make straight the decrees with justice,

But, as for me, I would declare to Perses the way things are. (*Works and Days* 9-10) (103)

Here again a significant difference between the *Theogony* and the *Works and Days*. In the former, Hesiod could indeed transmit the words of the Muses, but he could not guarantee the truth of those words, because of his inevitable mortal incapacity to distinguish *aletheia* from *pseudos,* that is, to ascertain the correspondence between the words of the Muses and reality. But in the *Works and Days,* where he speaks of human things whose knowledge is granted to men through their own experience, Hesiod can declare to Perses his intention to tell him *etetuma,* "things as they are." (104) Hesiod will immediately offer an illustration of the differences between the human and divine perspectives that inform the two compositions. In speaking about Eris, he revises the earlier teaching of the Muses by telling us that "on earth, it turns out that there are two Erides" -- not one, as claimed in the *Theogony*. What this means is that from the point of view of the gods, there is only one Eris, whereas for mankind, there are two.

"To summarize the complex scenario of the proem to the *Works and Days:* the Muses are to celebrate, i.e. praise their father Zeus and his

power over mankind, more specifically, his power to punish. Zeus is to listen, observe and act. Zeus's actions, it becomes clear, affect specifically those who would pronounce crooked decrees, i.e. the kings; Hesiod, for his part, will tell *etetuma* to his brother.(105) This cooperative undertaking and its division of labor, outlined in the proem, will structure the poem that follows. If in the *Theogony* Hesiod takes up the Muses' instructions to celebrate, i.e. praise the gods, here he pointedly does not praise; he tells things as they are.""

"Both the formal elements and the contents of the opening lines of the two Hesiodic poems reveal their respective orientations. On the basis of our foregoing analysis of the two proems, we can now offer an admittedly schematic but perhaps still useful diagram that plots the coordinates of the two compositions and demonstrates their complementarities (see the table)." (pp. 77-78)

Poem	*Theogony*	*Works and Days*
Authorization	Super-human authorization	Authorized by human experience
Proem form	Hymnic	Prayer
Subject-matter	Genesis of the gods; Zeus's order	Human life within Zeus's order
Register	Celebratory	Non-celebratory (telling it like it is)
Truth claim	Mixture of lies and truth	Things as they are (*etetuma*)
Emblematic gift	*thespis aude*: Muse-inspired song	*skeptron daphnes*: Muse-inspired eloquence
Role of the poet	Servant of the Muses: *aoidos* (Hesiod in *Theog.*)	Muse-honored king – or his surrogate (Hesiod in *W&D*)
Function	Pleasure Diversion from human pain Forgetfulness of human condition	Resolving quarrels Alleviation of human pain Reminding of human condition

To conclude: from its beginning, the *Works and Days* characterizes itself in opposition to the *Theogony:* the latter, through the mediation of the Muses, offers an Olympian perspective on the cosmos; the *Works and Days,* by contrast, directly and without the need for a divine intermediary, presents the human viewpoint. The task these two poems set for us entails highlighting these two visions and, while respecting their differences, integrating their perspectives into a larger whole. The best way to accomplish this goal would appear to be to examine the presentation of human beings in the *Theogony* and, conversely, the role of the gods in the *Works and Days*. But we must admit right at the outset to a certain lack of symmetry between the two compositions. That the gods should play an important role in human affairs is not surprising; their crucial presence in the *Works*

and Days is hence predictable. But given the announced subject-matter of the *Theogony,* to sing the immortal gods and the "race of those that are forever," the γένος αἰέν ἐόνι ων, seems rather to exclude mention of the mortal race of men, which is, by definition, ephemeral. But if mankind is doomed to die and inevitably evanescent, the human condition, as established by Zeus through his eternal decrees, is nevertheless eternal. Consequently, we may nevertheless discover within the confines of the *Theogony* an exploration of those eternal laws that determine the human condition." (p. 80)

Notes

(103) Rousseau (1996) 106-10 notes the urgent tone here and understands the phrase as "straighten the decrees which are crooked."

(104) Cf. Rousseau (1996) 113-13. Nagy (1990) 68, n. 84 and (1996) 50-52 conceives of ἐρήτυμαμυθήσασθαι as an earlier expression, which becomes an unmarked member as opposed to the newer, marked ἀληθέα γηρύσσθαι. This diachronic interpretation would blur the important distinction Hesiod makes between the contents of the two poems.

(105) Cf. Mazon (1914) 36.

From: Jenny Strauss Clay, *Hesiod's Cosmos*, Cambridge: Cambridge University Press 2003, pp. 58-62

"When the Muses come to the shepherds on Helicon and confer upon the intrepid Hesiod the letters patent for his poetic mission, they

formally declare their authority by means of an opposition.

They inform their audience (at *Theogony* 27-8) that they know how to say 'many false things that are like the genuine' (*pseudea polta etymoisin homoia*), but also, when they wish, how to 'speak true' (*alethea gerysasthai*). (2) Which said, they give Hesiod a sceptre of laurel and invest in him the power to celebrate the gods in song (29-34). Pietro Pucci finds in the Muses' declaration a general thesis about the medium of their power, language (or, as he puts it, 'the logos'): namely, that 'the logos signifies things by imitating them with some obliquity, distortion, and addition', because 'the "original" signified is always absent'; a thesis he explicitly labels as Derridean, comparing 'Derrida's insight that the . . . "signified" is always caught in the web of the differential, deferring, negative relationships that allow the emergence of meaning and can never appear as present hic et nunc'. (3) Pucci's Derridean interpretation has been followed as such and developed by Marilyn Arthur. Summarizing Pucci's position, she asserts that in Hesiod's formulation 'both the true discourse and the false one are "imitations", but the true logos ... imitates "things as they are", while "the concept of false discourse derives from the idea of imitation as difference from things, simulation of identity with things" '; and declares on her own account that 'in order to understand what Hesiod says' we must bring to bear 'the recognition that language itself -- the logos -- is a form of fiction, that representation itself is always, in some sense, a "lie" (4)

Both interpretations of the Muses' words have the merit of appreciating that in so generally phrased a statement, and one put on the lips of poetry's presiding spirits at the moment when the poet is confirmed in his craft, we would do well to look for an insight into how Hesiod conceived of the very workings of language -- the mastery of which he here accepts as the Muses' gift. Alternative interpretations of these much-contested lines, by contrast, have long sought to make the allusion more specific and locate the truth and falsehood to which the Muses refer in particular poems or bodies of poetry, Hesiodic and Homeric. Of course, the two lines of interpretation are not mutually exclusive; Hesiod could perfectly well be putting out a general statement about poetic language with particular targets in mind, or he could be conducting a special polemic which nevertheless through its phrasing reveals how he

conceives of poetic languages as such. And any attempt to settle for one or the other of these latter alternatives would swiftly be reduced to mere speculation. The important point is that the possibility of these lines having a particular target should not be allowed to block exploration of what they reveal, directly or indirectly, about Hesiod's more general conception of language. (5)

That the line of interpretation inspired by Derrida has vaulted this block is a significant achievement. However, the actual thesis that it distils from this passage of Hesiod seems to me to miss what is special -- and especially interesting -- about Hesiod's view of language. What I find striking in these two lines of the *Theogony* is that only of falsehoods, and precisely not of language in general, do the Muses say that they are 'like the genuine'. In expressing their capacity for truth-saying, the Muses make no reference to a relation of likeness or a talent for imitation, but simply state that they know how to 'speak true' (or 'truths'). Pucci and Arthur, invoking Derrida, generalize the 'obliquity' of likeness or imitation to describe the metaphysical relation between words and world; but for Hesiod's Muses such indirectness seems to characterize only the false things we say about the world, not the true things.

In effect, Pucci and Arthur read the couplet as if the line in which the Muses mention their ability to imitate the genuine (or 'real' or 'true') were in fact a general statement of their mastery of language, of which the following line describes a special case: to wit, when the result of their imitation is itself something true. They treat the second line as subordinate to the first, rather than coordinate with it. This is no straightforward misreading on their part. I have reproduced in this section only their conclusions, and have not yet considered the steps by which they come to their opinion. Before I do so, however, I will fill out what I take to be the widespread and philosophically intriguing pattern of archaic Greek thought which shows through this text on my reading of it, and which I feel their reliance on Derrida has led them to miss. I can then appeal to the distinctive character of this material in order to resist their attempted assimilation of it to the Derridean model." pp. 45-47.

Notes

(2) The use of polar opposition to express a god's power is frequent in archaic texts. A famous example is that of the two jars of Zeus at *Iliad* XXIV 527, one containing good, the other bad fortune; so too in Hesiod's *Works and Days* we read that a safe time for sailing is fifty days after the summer solstice, unless Poseidon or Zeus are set against it, 'for in them lies the determination of both good and evil' (669); and cf. *Theognidea* 157-8 (West -- to whose edition of the work I refer throughout this paper). These examples set a positive against a negative value; but this is not invariably the case: e.g. *Odyssey* v 47-8 (Hermes uses his staff both to put mortals to sleep and to wake them from sleep, as he chooses); and x 22 (Aelus has the power to calm and to stir the winds, whichever he wishes). Thus we cannot tell simply from their use of the motif whether Hesiod's Muses in the Theogony, by setting lies against truth, are opposing something bad to something good. I have tried to make my translation of their words broad enough to reflect the fact that the Greek terms rendered as 'true', 'false', 'genuine' do not distinguish 'truth' -- a linguistic property applicable only to propositions -- from 'reality', said of things in general.

(3) The quotations are from P. Pucci, *Hesiod and the Language of Poetry*, Baltimore, MD, Johns Hopkins University Press, 1977, pp. 12, 13 and 13-14 respectively.

(4) I take the quotations from M. Arthur, ' *The dream of a world without women: poetics and the circles of order in the Theogony prooemium*', Arethusa XVI 1, 2, p. 105 (citing Pucci, op. cit., p. 16) and p. 106. Henceforth in this chapter 1 will refer to these two articles simply by author's name and page number.

(5) The variety of non-Derridean interpretations of the Muses' message is considerable, and beyond my brief to consider here. A good conspectus of the range can be extracted from the following sources: W. Stroh, 'Hesiods lügende Musen', in H. Gorgemanns and E. A. Schmidt (eds.) *Studien zum antiken Epos*, Meisenheim am Glan, Anton Hain, 1976; H. Neitzel, ' *Hesiod und die Lügenden Musen'*, Hermes CVIII, 5, 1980, pp. 387-401; G. Nagy, ' *Hesiod*', in T. J. Luce (ed.) *Ancient Writers*, vol. I, New York, Scribner's, 1982, pp. 43-73; E. Belfiore, ' *"Lies unlike the truth": Plato on Hesiod, Theogony 27',* Transactions of the American Philosophical Association CXV, 1985, pp. 47-57.

From: Giovanni Ferrari, *Hesiod's mimetic Muses and the strategies of deconstruction* - in: Andrew Benjamin (ed.), *Post-structuralist Classics*, New York: Routledge 1988, pp. 45-78.

"In the *Works and Days*, Hesiod seems to offer us not only a different model of narrative reference through the *ainos* and its relatives but, in the word *etetuma*, an entirely different model of poetic truth from that suggested by the *Iliad* 2 [484-87] and *Odyssey* 8 [487-91] passages, a notion compatible with fiction in a way that those passages are not. Like *alethes*, *etetumos* is normally translated 'true.' This has encouraged many interpreters to assimilate Hesiod's claim to speak *etetuma* to Homer's claim in *Iliad* 2 and to a larger conception of archaic poetry as committed to *aletheia*. Nonetheless, several scholars who have examined the archaic vocabulary of truth in detail have argued that *etetumos* actually represents a notion of truth distinct from that represented by *aletheia*.(a) I will not discuss that work in detail here, some of which I do not perfectly understand, but I will discuss a few distinctions I think most easily defined.

Aletheia has a subjective component that *etetumos* does not.(b) The speaker of *aletheia* has fully in mind what really happened and wishes to speak it forth honestly and fully; the speaker's knowledge and good intentions are equally essential. A speaker of *etetuma* (or of *etuma*, I do not believe the two are distinguishable) need have no such knowledge or intention. The word merely describes a correspondence between the speaker's words and the reality he or she describes. For example, one may speak *etumon* (singular form) in conjecture, as Nestor does at *Iliad* 10.534, when he wonders if the sounds of approaching horses might signal the return of Odysseus and Diomedes, or as Helen does at *Odyssey* 4.140, where she ventures to identify Telemachus as Odysseus' son. Both ask before they speak, 'Will I say something true (*etumon*), or will I speak a falsehood (*pseusomai*)?' Likewise, dreams may come 'true' (*etuma*). In this case, truth has nothing to do with a knowledgeable or honest .speaker; *etuma* describes the correspondence between reality and the description of reality in the dream. The etymologies of the two words seem to bear this distinction out: *aletheia* entails an absence of deception (*lethe*) that could only be possible in an account given by a knowledgeable and well-intentioned speaker, *etuma* is related to the verb 'to be' and thus reflects only conformity with 'what is.' Though

both words may be opposed to *pseudos* (falsehood), *etumos* is used when that falsehood is of an unintentional kind, and *aletheia* is used when the falsehood is a deliberate fiction.(c)There is a certain amount of overlap between the two concepts. Though all examples of *etetuma* are not *aletheia* -- some are not spoken by a knowledgeable speaker with the desire to reveal what he or she knows -- some clearly are. Moreover, I find it difficult to think of an example of *aletheia* that would not also be *etetuma*. Nonetheless, the two words have different emphases: *aletheia* places a much greater emphasis on the speaker's intentions. Thus, it is virtually always used in promises. In fact, Hesiod deviates rather strikingly from a familiar Homeric formula of promises (*alethea muthesthai*) when he uses the metrically equivalent expression *etetuma muthesaimen*."

Notes

(a) See Krischer 1965 and Levet 1976 on *etumos* and *alethes*.

(b) My conclusions are based on two sets of comparisons: between the use of the adjectives alethes and et(et)umos, and between the use of the neuter substantive et(et)uma and the neuter substantive *alethea* plus the noun *aletheia*. I can see no obvious distinction between *etetumos* and *etumos* or between *alethea* and *aletheia*. It should be noted that *etetuma* and *alethea* are metrically equivalent, so their differing uses can not be explained by metrical exigencies.

(c) See *Odyssey* 14.125, *Theogony* 27-28, and *Hymn to Hermes* 560-63 for the contrast *aletheia / pseudos*. All three passages explicitly mention desire as a necessary criterion for the speaking forth of *aletheia*.

Pindar

Studies:

"Pindar makes only two overt claims to truth (*aletheia*). Both occur in association with oaths and therefore seem intended to vouch for the sincerity of the poet's claims and for his personal knowledge of their validity. In Olympian 2, Pindar introduces his praise of Theron with the line 'I will speak forth a sworn report with truthful [*alathei*] intention' (O. 2.92). With truthful (alathei), Pindar seems to state his intention to reveal fully and honestly what he knows. Pindar also juxtaposes truth and oaths at Olympian 13.98-100. Here the voice of the herald, which is said to be both true (alathes) and made under oath, 'vouches for' (Nisetich, Frank - *Pindar's Victory Songs* - Baltimore, John Hopkins University Press, 1980) or 'lends weight to' (Slater, William J. *Lexicon to Pindar* - Berlin, Walter de Gruyter,1969) Pindar's claims that the victor's family has won sixty victories at the games. There can be little question that Pindar is here using a notion of truth that is both referential and non-fictional. Indeed, Pindar can not acknowledge that in transferring such information, he is making things up or lying. At Nemean 7.63, Pindar claims to speak true (*etetumon*) praise. Here the focus may be more on validity than on the speaker's intent. The net effect of all three claims is, however, the same: to suggest a correspondence between the victor's worth and the praise offered, to insist on the validity of the poet's praise. Again, all of these passages discuss a specific responsibility of the epinician poet and therefore tell us little about the poet's appreciation of fictional narrative.

In two related passages, Pindar not only demands *aletheia* of his poetry, but asks the goddess Truth, *Alatheia*, to fend off lies (*pseudea*; fr. 205). The characterization of Alatheia in this passage as the 'font of great excellence' suggests that we are again in a context where the correspondence between praise and true worth, the evaluation of character, is essential. In a similar way, when Pindar calls on Olympia as the mistress of truth (*alatheias*; *Olympian* 8.2), he seems to have in mind the Olympic games as a testing ground for a man's true worth (Slater 1969).

In the opening lines to Olympian 10, Pindar calls on the Muse and *Alatheia*:

Read out for me the Olympian victor, son of Archestratos, where he is written on my heart. For owing him a sweet song, I forgot [*epilelath*] O Muse, you and Alatheia, the daughter of Zeus, with straight hand, fend off the reproach that I mislead my friends with lies. (*Olympian* 10.1-6)

Here Pindar clearly plays on a notion of *aletheia* as a kind of unforgetting. (a) But this passage does not make truth synonymous with memory, for Pindar also opposes lies (*pseudea*) to truth here. Having made a promise, Pindar forgot; his promise thus turns out to be an invalid kind of speech. In Greek terms, because intentions are not an essential component of the *pseudos*, this makes the initial promise a falsehood (*pseudos*). (b)Pindar now wishes to bring his earlier promise to fulfillment and thereby to make it true. Consequently, he calls on Alatheia. (c) She may also be present to vouch for Pindar's original sincere intention."

Notes

(a) I tend to see this more as deliberate word play than as reflecting a mythical notion of truth.

(b) See also *Iliad* 19.107, 7.351, where the unintentional breaking of a promise and an oath makes the speakers of the oath / promise liar.

(c) The Muses probably represent the presence of memory that can counter Pindar's forgetfulness.

From: Louise H. Pratt, *Lying and Poetry from Homer to Pindar. Falsehood and deception in Archaic Greek poetics*, Ann Arbor: The University of Michigan Press 1993 pp. 118-119.

"In portraying himself as an interpreter of the Muse's oracle, Pindar draws attention to himself as master of an ambiguous code that transmits some divinely certified truth. (5) But he does not mean to suggest, even in the most oblique way, that his interpretations constitute or "construct" a realm of truth. That would imply an interpreter who does not discover truth, but fashions it himself through the persuasive power of poetic language. His use of oracle imagery to set forth his poetics goes out of its way to discourage any view that credits the poet with constructing the truths he communicates. It promotes instead the suggestion that he discovers

them. Oracles utter coded messages of which interpretations are either correct or incorrect; oracular utterances have a determinate meaning, a right interpretation. In likening the poet to the specially skilled interpreter of an oracle, then, Pindar claims that he is able to give the correct interpretation, one that discovers (does not construct) its true meaning. To suppose that Pindar's interpretations aim to provide merely a reading or a theory would be to neglect his model of poetry as interpretation that captures a divinely authoritative message." pp. 63-64 (notes abbreviated)

"We are now in a position to draw some conclusions about Pindar's place in place in the development of early Greek conceptions of literary fiction. Recent criticism emphasizes Pindar's role in a developing awareness of poetic language's persuasive power. Truth is not a matter that pits fact over fiction, but solely a matter of what poetry has the power to make appear convincing through its particular charm. According to this account, Hesiodic poetics began to question the Homeric assumption of poetry's truth by admitting the possibility that the Muses can fashion "lies similar to true things." Pindar pushes things a step closer to Simonides' more blatant claim that "appearance forces even truth." (fr. 598 *Poetae Melici Graeci*)Simonides' remark implies that there is no such thing as truth, but merely appearance; telling the "truth" is simply a matter of saying something persuasive. (25) Pindar is thought to move toward the Simonidean perspective by recognizing the "authenticating power of poetic language" in his own poetry. The power of language to create the appearance of truth is, according to this view, displayed not only by the poetry Pindar criticizes as "deceptive," but, together with a certain amount of self-consciousness, by his own poetry. In his highly self-conscious revision of the Tantalus story, for example, Pindar describes the deceitful versions as "embellished" and "intricate. " (*Olympian* 1. 29) But elsewhere he applies the same terms to his own poetry with no negative connotation. (*Nemean* 8. 15 fr. 94b)

(...)

This account of the development of conceptions of truth confuses several issues and must be adjusted. Hesiod's poetics retains the idea of factual truth and holds to assumptions inconsistent with Simonides' radical view. In adopting the possibility that Muses deceive, Hesiod assumes that there is some reality about which the

Muses are either truthful or deceptive. For the Muses to exercise their powers to deceive by conveying falsehoods, there must be some truths about which they can deceive mortals. Hesiod does not, then, question the idea of factual truth. Unlike Homer, however, he does deny that poetry provides men with knowledge of that truth. Hesiod's innovation is epistemological rather than metaphysical: the audience is no longer provided a knower's master of any truths that Hesiod's poetry may convey. That there are truths to be shared or deceived about remains beyond question for Hesiod. In contrast, Simonides' view leaves no room for Hesiod's deception because for him there is no falsehood of which an audience can be persuaded.

Like Hesiod's, Pindar's poetics assumes that there are facts for poetry to convey. We have seen how, in his version of the Tantalus myth, Pindar promises to provide factual accuracy. Furthermore, in claiming that other versions of the tale are deceptive, he shares Hesiod's assumption that there is something about which to be truthful or deceptive. Pindar renders human access to truth problematic, but in a way very much milder than Hesiod. Pindar's Muse is not a potential deceiver like Hesiod's; in this respect Hesiod's is the more radical, and Pindar's the more traditional, view. But as the interpreter of the Muse's "oracle," Pindar admits the possibility that the poet may misinterpret the Muse. For example, in fragment 205 he prays to avoid stumbling into falsehood. For Pindar, then, human shortcomings rather than divine deception can break the audience's epistemological connection to the truth that poetry can convey. Although he admits the possibility of conveying falsehood, the focus in Pindar is on his poetry's truth.33 It is not the authenticating power of poetic language that lies at the root of that truth, although Pindar indeed advertises the nearly magical power of poetic language and suggests that the particular charm of that language contributes to the persuasiveness of his poetry. But the truth his poetry conveys holds independently of charm or persuasion. As we have seen, the truths that are particularly of interest to Pindar praise his subjects. The Muse reveals such truths to him in a cryptic form that the poet must interpret. If Pindar interprets the Muse correctly and conveys such truths to his audience, then he conveys the moral reality behind the gods' evaluation of the victory, the victor, and his kinsmen. Provided that Pindar's poems interpret their inspiration accurately, they convey the god's evaluation, not the poet's or not only the poet's. From a

Socratic perspective, Pindar's poetics command no authority. Pindar will be vulnerable to the charge of promoting moral authoritarianism, adhering to moral evaluations grounded only in avowed divine authority. Socrates will expose the poet's claim to enjoy a natural, god-given knowledge as more often than not efforts to allow Pindar and others to uphold conventional, aristocratic values without defending them on any grounds more substantial than an appeal to divine decree. pp. 72-74 (notes omitted)

Notes

(5) Pindar explicitly connects the Muse with Truth at Olympian 10. 1-6: ("Read me the name of the Olympic victor, / the son of Archestratos, where it is written / in my mind, for I owe him a sweet song and have forgotten. O Muse, but you and Zeus' daughter, / Truth, with a correcting hand / ward off from me the charge of harming a guest friend / with false promises.") See also *Olympian* 4. 17-18; 6. 20-21; 7. 20-21; 13. 52; 10. 3-4; *Pythian* 1. 86-87; fr. 205.

From: Grace M. Ledbetter, *Poetics before Plato. Interpretation and authority in early Greek theories of poetry*, Princeton: Princeton University Press 2003, p 63 n. 5.

"As Marcel Detienne has documented in his survey of Archaic Greek poetics, the poetic power of *mnemosune* 'remembering' is traditionally associated with light, which is in conflict with the darkness of *Léthé* 'forgetting'. (32) What is illuminated or obscured by poetry is what is respectively preserved or lost in the tradition.

The concept of *léthé* 'forgetting', however, is not only negative. As Detienne points out, *léthé* is not only the opposite of *mnemosune* 'remembering': it can also be an aspect of *mnemosune*. (33) For example, the goddess Mnemosune is described in the *Theogony* of Hesiod as giving birth to the Muses, divine personifications of the poet's power, so that they, through their poetry, may provide *mnemosune* 'forgetting' of sadnesses and of worries for humankind (53-55); whoever hears the Muses no longer *memnetai* 'remembers' his own ills (*Theogony* 98-103). By implication the highlighting of the glory of poetry is achieved by shading over anything that detracts from it. A bright light needs a background of darkness.

Such a concept of *mnemosune* can be achieved only through an ever-present awareness of its opposite, *léthé*. Without the obliteration of what need not be remembered, there cannot be memory -- at least, from the standpoint of Archaic Greek poetics.

Let us reformulate these thought patterns in terms of an opposition between unmarked and marked categories. (34) In an opposition of *mne-* 'remember' vs. *leth-* 'forget', *mne-* would be the unmarked member and *leth-*, the marked, in that *leth-* can be included by *mne-* as an aspect of *mne-*. Besides the passage just considered from the *Theogony*, I cite another striking illustration, from a different source: in the ritual of incubation connected with the cult of Trophonios, the initiate drinks from the springs of both *Lethe* and *Mnemosune*; this way the undesired mental state can be shaded over while the desired mental state is highlighted (Pausanias 9.39.8). (35)

To pursue the subject of these thought patterns even further, I cite an example of unmarked and marked opposition in the English language. In an opposition of the pronouns he and she, he is the unmarked member and she, the marked, in that she is included by he as the feminine aspect of being he. The masculine aspect of being he, by contrast, has to be achieved through an ever-present negation of the feminine. We may say something like: this is not a she, this is a he. Otherwise he does not, of and by itself, convey a masculine aspect. In generalizing statements, for example, he can stand for both he and she, as in "everyone may interpret as he chooses." (36)

Where the unmarked member excludes the marked member through a negation of the marked, the unmarked member receives a minus interpretation; where the unmarked member includes the marked, it receives a zero interpretation. (37) The minus interpretation of the unmarked member is ever- present in the context of a given Archaic Greek poem's references to itself as absolute truth, conveyed by a specialized *mnemosune* 'remembering' that excludes lethe instead of including it. These relationships can be visualized as a larger circle of *mnemosune* 'remembering' that includes an inner area of *lethe* 'forgetting' surrounding a smaller circle of specialized *mnemosune* 'remembering' that excludes the outer area of *lethe* 'forgetting'. The area of forgetting is visualized as the ongoing erasure of things not worth remembering, erasure by way of *lethe* 'forgetting'; the smaller circle of remembering, within the larger circle, is highlighted by the

area of darkness surrounding it, the area of forgetting. In fact, a special word in the diction of Archaic Greek poetry formalizes this specialized and exclusive kind of remembering: that word is the negation of *lethe* 'forgetting', namely *a-letheia*, normally glossed in English as 'truth'. A comparable case of minus interpretation in English can be seen in the word unforgettable. The aletheia 'truth' of the poet is the nonerasure of the poetic glory that is his to confer.38 The same concept is evident in the periphrastic expression *oude me/se/he lethei* 'it does not escape my/your/his-her mind', which conventionally reinforces injunctions to be *memnemenos* 'mindful, remembering'. (39)

Besides contrasting with negative thoughts about human ills, (40) or erroneous thoughts that lead to injustice, (41) the aletheia of Greek poetry tends to contrast with the divergence of local poetic versions in the overarching process of achieving a convergent version acceptable to all Hellenes. (42) This argument brings us back to the observation of Levi-Strauss that the latest performance of myth is in principle an occasion for selecting from and thereby potentially erasing versions available from countless previous performances. (43) In what survives of Archaic Greek poetry -- and now I am using the word poetry in the broadest sense -- what we keep finding is the ultimate extension of this principle, to the point where the latest version becomes the last version, a canonization that brings to a final state of crystallization what had been becoming an ever-less fluid state of variation in performance. (44) I attribute this canonization not so much to the phenomenon of incipient literacy as to the broader social phenomenon of Panhellenization. (45) I reiterate that this phenomenon is relative from the standpoint of an outsider to the tradition, in that some compositions are more Panhellenic in scope than others. From the standpoint of the insider to the tradition, however, in the here and now of performance, the Panhellenic perspective is the absolutist perspective of *aletheia* 'truth' . (46)"

Notes

(32) Detienne *Les maître de vérité dans la Grèce archaique,* Paris 1973 22-27. For example, Léthé or 'Forgetting' personified is descended from Night in Hesiod *Theogony* 227/224; Mnemosune 'Remembering' is contrasted with darkness in Pindar *Nemean* 7.12-16.

(33) Detienne, pp. 69-80.

(34) For these terms, see the *Introduction*, p. 5: The second of the two basic concepts of linguistics that I use throughout this book is the distinction, from a synchronic perspective, between the marked and unmarked members of any opposition within the system of language. These terms are defined as follows by Roman Jakobson: "The general meaning of a marked category states the presence of a certain (whether positive or negative) property A; the general meaning of the corresponding unmarked category states nothing about the presence of A." (R. Jakobson *Shifters, Verbal categories, and the Russian verb* Cambridge, Mass. 1957; reprinted in *Selected writings* The Hague *,* Mouton, 1971 pp. 130-147). The unmarked category is the general category, which can include the marked category, whereas the reverse situation cannot hold.

(35) See the discussion by Detienne, p. 74.

(36) Waugh 1982 compares the French usage of the masculine gender as the unmarked member of an opposition with the feminine, in that the masculine can stand for the category as a whole: thus an adjective describing both masculine and feminine categories will be put into the masculine: *des hommes et des femmes intelligents*.

(37) (omitted)

(38) Given that the smaller circle within the larger circle symbolizes the specialized sort of *mné*, that is, *a-letheia*, I would say that the larger circle that contains *leth-* would correspond to the function of the Muses, who help humans forget some things so that they may remember others. The root * *mna-* of *mne-* 'remember' may in fact be related to the root * *mon-t-* (or * *mon-th-*) of Mousa 'Muse' (Hesiod *Theogony* 53-55, 98-103). The etymological connection is certain if Mousa is to be derived from the root * *men-*, expanded as * *mon-t-* (or * *mon-th-*), which is one of several possibilities entertained by Chantraine *Dictionnaire Étymologique de la Langue Grecque* 716. The relationship of the root * *men-* with the expanded form * *mna-*, as in *mne-,* is clear: Chantraine, p. 703.

(39) The pertinent passages are discussed in Nagy *Sema and Noesis: some illustrations* Arethusa (1983 16:35-55) 44. This expression *oude me/se/he lethei* 'it does not escape my/your/his-her mind' implies a

synchronic understanding of the word *aletheia* as a compound consisting of privative a- and the root *leth-*. In the formulation of Cole 1983 12, the reference of *aletheia* is "not simply to non-omission of pieces of information ... but also to not forgetting from one minute to the next what was said a few minutes before, and not letting anything, said or unsaid, slip by without being mindful of its consequences and implications." (For a critique of Heidegger's celebrated explanation of *aletheia*, see Cole, pp. 7-8.) Cf. also Detienne 1973 48g107.

(40) I cite again Hesiod *Theogony* 53-55, 98-103.

(41) On this theme, see Detienne 1973, 29-50.

(42) This is not to say, of course, that the convergent version may not be complex, containing multiformities within its overarching uniformity.

(43) Cf. p. 57; cf. also p. 80.

(44) A. P. Royce *The anthropology of dance* Bloomington 1977 104 points out, with reference to traditions of dance, that various structures of performance, as they become progressively more rigid, can suffer "abrupt confrontation and loss."

(45) The threat of "abrupt confrontation and loss," to use the expression quoted immediately above, could help promote an impetus for recording by way of writing. But a critical attitude toward myth is caused not by the technology of writing but rather, more fundamentally, by the between variants of myth. See p. 57.

(46) We may well ask: how does the local perspective contribute to the Panhellenic, and to what degree does the Panhellenic perspective recognize the local? From the standpoint of the local tradition, the best chance for self-assertion is a process of self-selection that accommodates the Panhellenic tradition. Note the discussion by Royce 1977 164 of the repertory of some 90 *sones* (dances) among the Zapotec of the Isthmus of Tehuantepec: in asserting their identity to outsiders, the Zapotec tend to select just three of these 90 *sones*. Royce notes (ibid.) that "these three are the dances that any non-Zapotec would name if asked about 'typical' dances of the Isthmus," and that it is these three dances that are synthesized by the Ballet Folklorico in its suite "Wedding in Tehuantepec."

Poets of Alexandrine Age: Callimachus, Theocritus, Apollonius of Rhodes, Herondas

Studies:

"This study aims at identifying and clarifying the meaning carried by the noun ἀλήθεια, the adjectives ἀληθής, ἀληθίνός, and their synonyms in the works of the four most representative authors of the Alexandrine age: Callimachus, Theocritus, Apollonius of Rhodes, and Herondas.

The study breaks down into five chapters.

The first chapter analyses all passages of Callimachus' works featuring the adjectives ἀληθής and ἀληθινός.

Similarly, all excerpts including the lexemes ἀλάθεια, ἀλαθής, and ἀλαθινός in Theocritus, and the lexemes ἀληθείη, ἀληθής, ἀληθίνός in Herondas, are examined in the second and third chapters, respectively.

The fourth chapter is dedicated to Apollonius' *Argonautica*. As no record of either the noun ἀλήθεια or the adjectives ἀληθής and ἀληθινός is available in the four books of the *Argonautica*, the study concentrates on the synonyms of ἀληθής and ἀληθινός used by Apollonius: ἐτεός, ἐτήτνμος, νημερτής, ἀτρεκής.

The fifth chapter focuses on the synonyms of ἀληθής and ἀληθινός which can be found in the works of Callimachus: ἐτεός, ἐτήτνμος, ἔτυμος, ἀτρεκής; Theocritus: ἐτεός, ἐτήτνμος, ἔτυμος, ἀτρεκής; and Herondas: ἔτυμος.

An introductory essay provides a detailed account of the study's general objective and specific aims.

The results of the research are summarised in the conclusions, which offer an overview of the analogies and differences of the authors under consideration with respect to their specific understanding of the notion of 'truth'.

The study also contains a bibliography and an index."

Abstract of the Thesis by Barbara Giubilo: *L'Aletheia e i suoi sinonimi nella poesia alessandrina (Callimaco, Teocrito, Apollonio Rodio, Eronda)* Roma, Università "Tor Vergata", 2007.

Thucydides

Studies:

History of the Peloponnesian War: Chapter 1.1 - 1.23 ("Thucydides' Archaelogy")

"Because the means by which a world is disclosed are hidden and, indeed, withdraw from view, there are several issues in the key programmatic sections of 1.21-3 that I believe have been consistently misunderstood. There is no better way further to illustrate the subtle workings of Thucydides's Archaeology than to dissolve some of the errors that surround it. The issues I will discuss relate to "unconcealedness" (*aletheia*), "what is appropriate" (*ta deonta*), "pre-text" (*prophasis*), "compulsion" (*ananke*), and "kind" (*toioutos*).

Unconcealedness (*Aletheia*)

Thucydides does seem interested in aletheia, which is usually translated as "truth." Truth is understood conventionally as positing a correspondence between word and world, and so, this interpretation maintains, when Thucydides discusses the importance of *aletheia*, he is emphasizing the importance of matching up his language to events (*logos to ergon*). Yet Thucydides uses neither *aletheia* nor *to alethes* particularly often in these opening sections (or generally, especially not in his own voice). He does, as we have seen, employ numerous visual words, such as to saphes, at crucial places. These words are in turn often translated in terms of "truth," even "historical truth," (1) but such translations put the cart before the horse. The converse seems far more apt; that is, *aletheia* should be understood in terms of *to saphes* and other visual terms rather than the other way around.

In Thucydides's *Archaeology* visual metaphors dominate *vis-a-vis* truth claims. (2) Further, in specific contexts, Thucydides is quite able to assert that a claim or description is true in the sense that it corresponds to reality,3 but Thucydides does not do this often, and he does not do it in the Archaeology. And thus we should not efface the explicit visual language as somehow "primitive" (i.e., aspiring to real

truth) or metaphorical, especially when there is a sophisticated philosophical tradition both before and after Thucydides that takes the priority of vision seriously -- see the preceding discussion of the Presocratics, *eros* in both Gorgias's Helen and Plato's Phaedrus (also the allegories in the Republic), and *sophia* in the *Nicomachean Ethics*. And it is not just the philosophical tradition, there is also the tragic tradition, which, as we have seen, relies upon and dramatizes the human situation as bounded by vision of a complex sort. Human vision is further complicated by its tendency not to see that which it has most need of seeing.

The word *aletheia* is generally, though not uniformly, believed to retain the visual force of its etymology -- "as that which is not concealed." (4) If this is true, then we have all the more reason for associating claims concerning *aletheia* with the dominant visual imagery. Thomas Cole has maintained (*contra* Friedlander) that *aletheia* does retain a connection with *lethe* (oblivion) and that this connection is exploited as late as Plato's Phaedrus. (5) Hence the significance of the words *a-letheia* and *a-kribeia* in the key sections of Thucydides's *Archaeology*. These two related alpha privative words convey the difficulty of using logos in a manner that does not cover up as much as, if not more than, it succeeds in bringing to light. (6) In fact, Cole observes that *akribeia* is a characteristic especially associated with written texts, and it is in Thucydides that for the first time *aletheia* too is claimed to be the product of the type of precise method seemingly possible only through writing. (7)

It can be argued that there is a prima facie distinction between "not-not-noticed" and "unconcealed." (8) I must admit that I have a hard time grasping this distinction because in both cases *aletheia* is a visual accomplishment related to *logos*. I presume that somehow not-not-noticed is more reasonable. (9) Heidegger's notion of unconcealedness sounds as if the objects of *aletheia* are glowing, demanding to be seen, (10) whereas what a *logos* can do is merely to keep a hero mentioned among human subjects again and again -- no glowing is required. Heidegger does employ visual vocabulary to illustrate his point about *aletheia*, but in so doing, he sees himself as following a tradition (which he is), and it appears dubious to object to his position merely on account of the violence with which he brings vision to the fore. After all, Heidegger plausibly rejects the whole

subject-object distinction upon which Cole (following Snell) would seem to rely. If it is nonsense to say that truth lights up objects, it is, arguably, at least as nonsensical (though very modern) to claim that to be true is to be kept in the minds of human subjects.

Finally, it is procrustean to read the bulk of Thucydides's narrative as something that corresponds to reality. Correspondence presupposes exactly that separation between logos and the world that I believe Thucydides's text is remarkable for constantly challenging. Indeed, Thucydides's success in opening a world through logos is a decisive argument against reifying this distinction." (pp. 155-157)

Aletheia dans la Pensée Grecque d'Homère à l'Âge Hellénistique

Vrai et Faux dans la pensée del la Grèce ancienne

"Par l'effet d'une particularité tout à fait singulière, la langue grecque désigne cette notion de vérité par des termes négatifs : l'adjectif αληθής et le substantif αλήθεια. II y a là un mystère étonnant, qui n'est peut-être pas dépourvu de liens avec ce que l'en appelle le 'miracle grec'. Mais il ne faut pas oublier qu' ληθής et αλήθεια ne sont pas les seuls mots qui, à l'origine, s'appliquent à l'idée de vérité, bien que Platon et Aristote n'emploient pratiquement qu'eux pour la représenter, bien qu'ils traversent l'histoire du grec, d'Homère jusqu' aujourd'hui, bien qu'enfin, d'Homère à l'âge classique, ils connaissent un prodigieux développement, qui est contemporain de la disparition progressive de leurs anciens parents sémantiques. L'expression du vrai, en grec ancien, relève, en réalité, d'une terminologie complexe, composée de mots négatifs et positifs, que l'on se propose d'étudier ici, sans les séparer de leurs antonymes.

I. Les mots négatifs signifiant vrai.

A côté d'ἀληθής et d'ἀλήθεια, d'ἀληθώς, d'ἀληθεύειν, d'ἀληθίζεσθαι, d'ἀληθινός, d'αληθινώς et d'ἀληθοσύνη (ainsi que des composés dont le premier membre est ἀληθο- ou le second -αληθής), on remarque l'emploi d'ἀτρεκής, ἀτρεκεως, ατρεκείη, ἀτρεκειν (le substantif ἀτρεκότης est tardif) (1), de νημερτής (ναμερτής), νημέρτεια (ναμέρτεια), νημερτεως, d'ἀψευδής, ἀψευδεια, ἀψευδειν, ἀψευδέως (2).

II. Les mots positifs voulant dire vrai.

A époque ancienne, la représentation positive du vrai est assurée par la famille d'ἐτός. Outre ἐτός, qui est connu grâce à une glose d'Hésychius (3) et à des fragments de Callimaque (4) (il apparaît peut-être aussi dans quelques textes anciens) (5), elle comprend ἐτεός, 'τυμος, ἐτύμως, ἐτήτυμος, ἐτηύμως. 'Ετητυμία est tardif (6). 'Ετανός, ἐτυμώνιον, qui est éolien, ἐταυτῶς, ἐτέωνια, ἐτεωνειν, ne figurent que dans des gloses d'Hésychius (7). Les composés en ἐτυμο- se laissent classer en deux groupes différents, puisque l'on peut séparer ἐτυμόδρυς, qui se lit chez Théophraste (8), et ετυμηγόρος (9) des termes dans lesquels ἐτυμο- désigne le vrai sens d'un mot, son sens étymologique. Cette dernière valeur d'ἔτυμος figure pour Ia première fois chez Aristote (10). Les composés en ἐτέο/ω- sont peu nombreux. On doit citer 'Ετἐοζουτάδης, ἐτεοδμώς (dont l'existence même est douteuse), 'Ετεόκρητες, ἐτεόκριθος (11), 'Ετἐόκλέιος, 'Ετεοκληειη et différents anthroponimes.

Bien après l'époque de rédaction des textes homériques, apparaissent dans la langue (en particulier dans la prose classique) quelques formes bâties sur la racine du verbe ειναι (ὀντως, τω ὀντι, συσία) et l'adjectif ακριζής (dont sont issus le substantif ἀκιἰζεια, l'adverbe ακριζώς, le verbe ἀκριζουν et différents composés). Ces mots contribuent à I'expression de concepts voisins de celui de vrai : le concept de réel et celui d'exact." (pp. 1-3)

Notes

(1) Il apparait dans une scholie (Euripide, *Hyppolite*, 1114).

(2) Pour ἀλανές ἀληθές (Hésychius), mot difficile à classer dont l'étymh1ogie est mal connu, voir W. Prellwitz, *Glotta*, 19, 1930, p. 105 sq., et K. D. Georgoulis, *Platon*, 8, 1956, p. 228-229. Hésychius donne encore ἀλανέως ὀλοσχερως, Ταραντϊνοι et αλλανής ασφαλής, Αάχωνες ; W. Prellwitz hésite entre deux étymologies : ἀλανές peut-être apparenté à λανθάνω et αληθής ou à ἀλλανής, ἀλανέως, αλανέως (Elis).

(3) Cf. *infra*, § 39.

Subjectivité et objectivité en grec ancien et en français

"En fin de compte, les analyses proposées ici distinguent quatre niveaux différents dans un énoncé :

- Le niveau de l'énoncé proprement dit détermine un acte de parole avec des interlocuteurs dans une situation de discours.

- Le niveau de la source de l'énoncé détermine un point de vue, ou un énonciateur, ou les deux.

- Le niveau du contenu de l'énoncé détermine la représentation d'une situation événementielle qui a pour support référentiel le référent du sujet.

- Le niveau inférieur est d'ordre lexical. Il détermine un procès abstrait avec sa structure actancielle, mais sans représentation spatio-temporelle (avant la promotion d'un actant en sujet, c'est-à-dire en support référentiel).

On peut admettre que toutes les catégories verbales peuvent être définies par rapport à ces différents niveaux et à leurs éléments. Rien n'empêche donc d'observer des distinctions semblables dans une autre langue, par exemple en français moderne. Cependant, en français moderne, certaines distinctions sont moins nettes, sans doute parce que la syntaxe en est moins subjective. C'est ce que semble confirmer un petit aperçu sur le vocabulaire du vrai et du réel.

1. Aperçu de syntaxe contrastive du grec et du français :

Le français moderne (comme le latin) ne connaît que deux types principaux de systèmes hypothétiques. Ils correspondent respectivement aux hypothèses d'addition et aux hypothèses de substitution du grec :

- Type I : *si* + indicatif quelconque (= I et II du grec).

- Type II : *si* + formes d'indicatif en *-ais* (= III et IV du grec).

Des subdivisions sont cependant possibles, qui correspondent aux divisions du grec, mais imparfaitement :

Dans le type I, l'indicatif futur, souvent exclu, est cependant parfois admis : - Type I, 1 : « Si vraiment tu viendras demain » I du grec) (14).

- Type I, 2 : « Si tu viens demain » II du grec).

Dans le type II, les formes composées sont parfois employées pour marquer une valeur d'irréel, sans considération temporelle :

- Type II, 1 : « Si tu venais demain » (= III du grec).

- Type II, 2 : « Si tu étais venu demain » (= IV du grec).

Voici comment on peut rendre compte des nuances entre I et II du grec et I, 1 et I, 2 du français.

- Le type I, 1 du français suppose une assertion objective, c'est-à-dire une assertion vraie pour tous. Le sens est exactement « s'il est reconnu par tous que » = « s'il est vrai que ». C'est une hypothèse de vérité, pas tout à fait identique à « si quelqu'un dit que », hypothèse d'assertion subjective du grec.

- Le type I, 2 du français suppose un fait objectif et ne correspond pas tout à fait au type II du grec, qui suppose non le fait lui-même, mais l'événement qui le manifeste, qui lui donne sa représentation subjective. En français le sens exact est « s'il arrive que », en grec, c'est « s'il se manifeste que ».

Si le grec distingue nettement hypothèse d'assertion et hypothèse de manifestation, le français distingue peu hypothèse de vérité et hypothèse de réalité, de même que vrai et réel sont peu distincts dans le vocabulaire (15).

Voici comment on peut rendre compte des nuances entre III et IV du grec et I, 1 et I, 2 du français.

- Le type I, 1 du français suppose une situation de vérité non actuelle, donc fictive. Le sens exact « s'il était vrai que » ne correspond pas tout à fait à « s'il apparaissait que », hypothèse de point de vue non actuel du grec (16).

- Or une situation de vérité, notion objective et générale, ne peut être qu'actuelle ou non actuelle, c'est-à-dire liée ou non à la situation de discours. En revanche un point de vue, qui est subjectif et particulier, peut en outre être actuel et non réel, c'est-à-dire être lié à la situation de discours mais en contredisant le point de vue réel du locuteur. C'est le type de point de vue que caractérise l'indicatif secondaire modal du grec.

Le système dominant du français n'a pas d'irréel analogue à celui du grec. Mais il a la possibilité de spécifier comme caduque et devenue impossible une situation de vérité non actuelle. Il a pour cela recours à la forme composée, celle-ci perdant alors sa valeur temporelle pour une valeur modale, comme dans « si tu étais venu demain » qui implique « tu ne viendras pas demain »(17). Il faut cependant pour cela que le contexte empêche toute interprétation temporelle. Ainsi « s'il avait plu hier » n'est pas ainsi spécifié, car on peut le dire sans savoir s'il a plu hier.

Il faut cependant se garder de trop figer les systèmes. Si, dans les protases hypothétiques, l'imparfait français correspond bien à l'optatif grec, il a des emplois différents qui en font un irréel. Dans « Un peu plus, le train partait sans moi », il correspond à un indicatif secondaire modal du grec. Ne serait-ce pas la marque d'une

détermination plus subjective, l'expression d'un point de vue actuellement caduc ? Le plus-que-parfait du subjonctif dans « s'il eût été là » peut aussi déterminer un point de vue subjectif (18). Inversement le grec tend à rendre plus objectives ses déterminations syntaxiques, comme le montrent l'affaiblissement de l'opposition de ὀν et l'emploi devenant mécanique de ἄν, la généralisation de l'augment...

Néanmoins, on peut dire qu'en général grec ancien et français moderne s'opposent comme le plus subjectif au plus objectif, surtout sur les deux points suivants :

- Là où le français détermine un fait, le grec ancien déterminait la représentation d'un fait dans une conscience.

- Là où le français détermine une situation de vérité valable pour tous, le grec ancien déterminait un point de vue particulier.

Ce résultat est une confirmation de l'opinion exprimée par Guillaume, *Temps et Verbe*, Paris 1929, p. 48 : « L'hypothèse, primitivement élément intérieur de visée, est devenue en français moderne un élément extérieur objectivable sur la ligne d'actualité. »

2. Le vocabulaire du réel et du vrai en grec et en français :

Le français parle en principe d'un fait réel et d'une assertion vraie, c'est-à-dire conforme au réel. Mais la distinction n'est pas très tranchée. Réalité et vérité peuvent se confondre dans l'usage courant, et on a vu que réel n'a pas le même sens selon qu'il est opposé à éventuel ou à irréel. Confusion et ambiguïté tiennent sans doute à l'objectivité des termes. En effet la vérité repose directement sur la réalité des faits, vérité et réalité s'impliquent réciproquement.

Rien dans le grec homérique ne correspond exactement aux mots français réel et vrai, qui sont positifs et objectifs. Les deux mots homériques qui s'en rapprochent le plus, αληθής et νημερτής sont négatifs et subjectifs, comme l'a montré Levet, *Le vrai et le faux dans la pensée grecque archaïque. Étude de vocabulaire* (19).

αληθήςς signifie étymologiquement « non voilé ». Ce mot qualifie le réel en tant qu'il est dévoilé à une conscience humaine. Ce n'est pas « le réel qui est », mais le réel qui se manifeste dans l'expérience. Pour un Grec donc, les faits objectifs en eux-mêmes ne suffisent pas à

établir la réalité, et par suite la vérité ; encore faut-il qu'ils soient perçus comme tels. Cette conception subjective de la réalité, que révèle le vocabulaire, se trouve correspondre à ce que que nous avons dit du contenu de l'énoncé à partir de nos analyses syntaxiques : c'est un événement représenté, qui n'est pas ce qui arrive, mais ce qui se manifeste.

Aussi peut-on dire que le mensonge hypothétique d'Euryclée à Pénélope doit être découvert pour exister comme événement.

Νημερτή, quant à lui, qualifie étymologiquement l'absence d'erreur (ἁμαρτάνειν « se tromper »), c'est-à-dire « l'interprétation droite ». Pour un grec donc, la vérité ne découle pas simplement des faits, ni même de leur simple observation, mais d'une juste interprétation de ce qu'on observe. Cette conception de la vérité est illustrée par la notion de point de vue de vérité que nous avons tirée de l'analyse syntaxique de l'énoncé assertif. L'énoncé assertif est fondamentalement senti comme résultant d'un traitement personnel de l'information.

Les termes grecs ne caractérisent donc pas le fait réel et la proposition vraie (au sens logique de cette expression), mais l'expérience révélatrice et le jugement correct. Ces deux notions subjectives sont relativement indépendantes l'une de l'autre, contrairement à celles de réalité et de vérité. En effet l'expérience révélatrice n'implique pas nécessairement un jugement correct, alors que la réalité d'un fait s'exprime automatiquement dans une proposition vraie.

On pourrait facilement poursuivre cet aperçu sur le vocabulaire grec. Ainsi le ψευδος n'est pas le contraire du vrai, c'est-à-dire le faux, mais l'invention subjective (20.

Dans l'ensemble, les termes grecs du vrai et du faux reposent sur des significations plus subjectives que leurs homologues français. Cette plus grande subjectivité se retrouve dans les significations des catégories verbales du grec. De ce fait, celles-ci distinguent plus nettement qu'en, français source énonciative et contenu de l'énoncé verbal. C'est pourquoi l'analyse syntaxique a abouti à distinguer trois sortes d'objets imaginaires qui déterminent les différents types de protases grecques : une assertion (type I, et chez Homère type IV),

un événement (type II), un point de vue (type III, et après Homère type IV)." (pp. 246-250)

Notes

(14) Cf. Grévisse, *Le bon usage*, Paris: Ducoulot 1975, p.1034.

(15) L'emploi de l'indicatif dans « si tu viens demain » suggère que l'indicatif français est moins assertif que l'indicatif grec (en tant que mode non marqué ?). Aussi le français confond-il habituellement l'hypothèse à vérifier (« s'il est vrai que ») et l'hypothèse à réaliser (« s'il arrive que »).

(16) Il y a de même une correspondance imparfaite entre l'optatif oblique du grec (point de vue passé) et l'imparfait français de concordance des temps, qui est « un imparfait de récit » (situation de vérité passée, cf. Le Guern, *Notes sur le verbe français,* 1986, pp. 26-9).

(17) Le tour avec forme en *-ais* composée est apparu au XVIIe siècle, en concurrence avec le plus-que-parfait du subjonctif, qu'il a presque supplanté (Robert Léon Wagner, *Les Phrases hypothétiques commençant par "si" dans la langue française, des origines à la fin du XVIe siècle*, Paris : Droz 1939).

(18) De façon analogue, la valeur parfois non temporelle, mais encore aspectuelle de « j'ai mangé » (= « je suis repu ») suggère une conception plus subjective du contenu verbal (non le fait en lui-même, mais tel qu'il est perçu).

(19) Voir *l.l.* pp. 78-105 pour ἀληθης et 141-60 pour νημερτής. Ετεόὸ, ἐτυμος, ἐτετυμος, signifient « verifié, véridique ». Un autre mot négatif, ἀτρεκής, qualifie l'énonciation sincère (ibid. pp. 124-40).

Extrait de : Louis Basset, *La syntaxe de l'imaginaire. Étude des modes et des négations dans l'*Iliade *et l'*Odyssée, Lyon, Maison de l'Orient, 1989.

Homère

"Dans sa célèbre analyse de la *mimésis*, Éric Auerbach attrait déjà l'attention sur le "réalisme" singulier de l'épopée homérique. En se fondant sur l'étude d'un épisode bien connu de l' *Odyssée*, la "cicatrice d'Ulysse", il y montre l'existence d'une conception de la vérité située aux antipodes de celle que met en scène l'univers biblique : "On a souvent taxé Homère de mensonge ; mais ce reproche ne diminue en rien l'effet des poèmes homériques : il n'a pas besoin de fonder ses récits sur une vérité historique, sa réalité est suffisamment puissante (...). La Bible ne prétend pas seulement à la vérité de façon beaucoup plus expresse qu'Homère, elle y prétend tyranniquement (...) Le monde des histoires de l'Écriture sainte ne revendique pas seulement la vérité historique, il se donne pour vérité unique" (155) Ainsi, à la Vérité conçue comme valeur universelle l'épopée homérique préfèrerait une autre mesure de la vérité, la réalité.

(...)

Il semble, en effet, que l'homme iliadique soit plus vigilant à ne pas déformer ce qu'il rapporte ou conserve de la réalité, qu'à transmettre une vérité objective pour tous. J. P. Levet a bien mis en évidence l'importance des verbes de déclaration dans les conditions de manifestation du "vrai" : "c'est dans l'échange verbal, écrit-il, que se dessine la fonction première de la langue, traitée comme outil privilégié et irremplaçable de communication, entre deux ou plusieurs consciences, d'une science qui est, primitivement, uniquement sensorielle" (159)

Car percevoir est toujours, dans les Poèmes Homériques, un acte concret, indépendant de toute réflexion au sens théorétique du terme (160) et c'est justement parce qu'elle est fondée sur l'observation fine et méticuleuse des phénomènes que la connaissance, qui chez Homère n'est jamais théorique (161), transgresse la démarcation entre les sensations et la raison (162). Or, cette manière sensorielle d'acquérir la connaissance (dont nous avons constaté le rôle essentiel dans la querelle opposant Ajax et Idoménée), et les contraintes liées à sa communication, interdisent à l'homme de raisonner directement sur la réalité en sortant de lui-même pour aller au-devant de ce qui est objectivement. Comme l'a exprimé justement L. Basset, "ce n'est pas le réel qui est, mais le réel qui se manifeste dans l'expérience, qui

constitue le vrai" (163), ce qui revient à souligner l'importance structurelle de la focalisation dans la présentation des choses. L'individu est contraint de "travailler sur le donné installé en lui". Il ne peut transmettre la réalité telle qu'elle est et s'efforce de la rapporter telle qu'elle est reproduite en lui, sans la déformer (164). C'est pourquoi l'adverbe ἀτρεκέως, qui exprime la démarche de l'esprit dans son effort de passivité pour ne pas déformer ce qui est déposé en lui (165), convient bien à une énonciation qui doit à chaque instant capter avec acribie les fluctuations de la réalité en les nommant avec la plus grande précision, comme le fait l'aède dans l'épisode des jeux. Or, nous avons constaté que les locuteurs emploient fréquemment cet adverbe avec le verbe καταλέγειν, ce qui souligne à la fois que ce verbe désigne un mode d'expression bien connu des Grecs archaïques et que "l'on a pris au sérieux cette manière de donner des renseignements, en relation avec une manière de concevoir la réalité et limitée à la situation du donneur de renseignements" (166). Lorsqu'un sujet ne peut pas accéder directement à la réalité ou y faire accéder son interlocuteur (soit parce qu'il ne dispose plus que d'un souvenir, soit qu'il soupçonne son interlocuteur de déloyauté, soit pour une autre raison) tout ce qu'il peut faire, dit J. P. Levet, c'est lui donner un aperçu fidèle "point par point" de la réalité telle qu'elle est conservée en lui.

Pour l'homme homérique, la réalité n'est donc inscrite ni dans les choses (167), ni dans leur seule observation, mais elle prend forme dans la présentation que l'observateur en fait pour son destinataire, c'est-à-dire dans l'interaction où se construit Ie sens. Et le discours en catalogue, dont nous avons observé le pouvoir interactif, se révèle le mode discursif adéquat pour communiquer cette réalité, comme l'illustre avec force l'épisode où Ulysse n'entre en réelle communi(cati)on avec son épouse qu'au moment où il lui décrit en catalogue la fabrication de leur lit (168).

C'est sans doute la célèbre analyse que le philosophe M. Heidegger a menée sur la Vérité comme ἀλήθεια (169), qui explique la fascination des commentateurs des Poèmes homériques pour ce concept, en dépit de la rareté de ses occurrences dans les Poèmes, surtout dans l'*Iliade* (170). Ainsi, tout en critiquant l'interprétation étymologique heideggerienne de l'alétheia comme "dés-occultation" ou "dé-voilement" et "ouverture", T. Krischer pense pouvoir mettre en

relation ce terme avec le verbe καταλέγειν (171). Conformément au sens premier du verbe καταλέγειν que Krischer propose, à partir du sens de l'expression εμέ ἐλαθε, de traduire par "ne pas remarquer" (et non comme on le fait souvent, au prix de ce qu'il considère comme un " glissement sérieux ", par " être caché "), l'adjectif ἀληθής désigne en effet, si l'on tient compte de son préfixe privatif, le fait qu'un objet présent attire l'attention et est perçu par un témoin oculaire (172). T. Krischer préconise alors d'interpréter l'expression ἀλήθέα εἰπειν comme le fait de produire un énoncé qui présente l'objet de façon détaillée afin qu'il ne demeure pas "non remarqué". Or, ajoute-t-il, c'est le verbe καταλέγειν qui exprime en grec cette façon de dire précisément et concrètement quelque chose, d'en faire une "présentation réaliste et exacte qui la traverse point par point", sans rien laisser dans l'ombre, en considérant que chaque détail a son importance. Il conclut de ces remarques que "celui qui connaît la vérité sait la dénombrer et celui qui dénombre bien prouve par là qu'il dit la vérité", établissant ainsi un rapport de contiguïté entre la vérité comme *alétheia* et l'énonciation catalogale qu'il considère comme le mode privilégié de dénombrement du Vrai (173).

Si l'on ne peut que souscrire aux remarques lumineuses de T. Krischer concernant d'une part le sens perceptif de l'adjectif ἀληθής, d'autre part l'exhaustivité inhérente à la démarche présentative du καταλέγειν, on peut toutefois lui objecter que l'adjectif ἀληθής n'est jamais employé avec le verbe καταλέγειν. On trouve en revanche, associé à ce verbe, le substantif ἀλήθεια, une fois dans l' *Iliade*, dans le passage controversé de l'entretien entre Priam et Hermès en XXIV 407 (174, et six fois dans l' *Odyssée*, le plus souvent dans un vers formulaire. Or, à la différence de l'adjectif ἀληθής dont le sens reste concret, le substantif ἀλήθεια recouvre un concept dont la signification abstraite (175) ne peut s'adapter à la valeur sémantique concrète de καταλέγειν, ce que T. Krischer semble d'ailleurs pressentir lorsqu'il rappelle que "le concept abstrait est un outil qui rend l'énumération concrète superflue (176)." (pp. 279-284)

Notes

(155) *Mimesis. La représentation de la réalité dans la littérature occidentale*, 1946, traduction française Gallimard, Paris 1984 pp. 22-23, je souligne.

(159) *Le vrai et le faux dans la pensée grecque archaïque*, op. cit. p. 57.

(160) C'est ce qu'ont montré différentes analyses du mode de perception des anciens Grecs. En particulier K. von Fritz, dans un article éclairant ("Noos and Noein in the homeric poems", (Classical Philology XXXVIII, 1943, 79-93), explique comment, chez les Grecs d'Homère, la connaissance naît d'une perception (visuelle ou olfactive) et ne s'identifie jamais à in raisonnement. Certes, J. H. Lesher ("Perceiving and Knowing in the *Iliad* and the *Odyssey*", Phronesis XXVI 1981, 2-24) critique fortement ce pont de vue, alléguant que si connaissance et visualité étaient synonymes, l'illusion, qui abonde dans l' *Odyssée* comme l'a bien remarqué Aristote (*Poétique* 1459b) y serait impossible (p.14 sq.). En fait, von Fritz n'a jamais identifié sensation visuelle et connaissance (p. 90). Il montre que dans l'acte de *noein*, se manifeste l'usage d'un "sixième sens", une faculté de pénétrer pleinement une situation afin d'en saisir toute la signification, comme le peut celui qui, par exemple, ayant beaucoup voyagé, dispose de l'horizon vaste d'une perception élargie du monde (comme en *Iliade* XV 80 sq. et I 508 où Zeus est présenté comme celui qui "voit loin" - *euruopa*-). Mais s'il y a bien une différence entre 1'apparence d'une chose et la saisie de toute la subtilité de sa réalité, cette saisie n'est jamais abstraite. Comme l'ont souligné M. Detienne et J. P. Vernant (*Les Ruses de l'Intelligence, la Métis des Grecs,* Paris, 1974), elle est redevable de la *métis,* cette capacité de l'intelligence à s'orienter et à agir dans une situation concrète et complexe (p. 28), qui suppose un sens aiguisé de l'observation et de l'opportunité correspondant à ce que von Fritz appelait le "sixième sens", capable d'anticiper une réalité soumise au hasard. Voir aussi les remarques convergentes de G. Nagy, "Sêma and Noèsis : some illustrations", *Arethusa* 16, 1983, p. 38.

(161) Voir Ch. Mugler (*Les Origines de la Science Grecque chez Homère*, Paris 1963 pp. 15-22, 46 et 158). B. Snell montre aussi qu'il n'existe pas d'abstraction chez Homère (*Die Entdeckung des Geistes*, Hambourg 1948). Selon R. A. Prier ("Some thoughts on the archaic use of metron", *The Classical World* 1976, 161-169), la pensée archaïque est même en deçà de l'opposition *abstrait / concret* qui prévaudra à partir de l'irruption de la pensée philosophique et rationaliste du VIème siècle. Le *noûs* y est la faculté de *saisir la*

dynamique immanente à une situation offerte naturellement (p. 167) et d'approprier le geste à la situation concernée.

(162) Ch. Mugler, *Les Origines*, op. cit. p. 215, et l'analyse de R. Brague ("Le récit du commencement. Une aporie de la raison grecque"*La Naissance de la Raison en Grèce*, Actes du Congrés de Nice, dir. J. F. Mattéi, Paris, PUF 1990, pp. 25-27) qui souligne le rôle essentiel de la vue dans le mode de connaissance archaïque.

(163) *La syntaxe de l'Imaginaire*, Paris 1989, p. 249.

(164) Ibid. p. 237.

(165) Voir supra pp. 28-29.

(166) J. P. Levet, *Le Vrai*, op. cit. p. 169.

(167) Comme le souligne M. Merleau-Ponty (*Le Visible et l'Invisible*, Paris 1964 p. 173), "nous ne voyons pas les choses toutes nues parce que le regard même les enveloppe, les habille de sa chair".

(168) Voir *supra* p. 189 sq.

(169) *Platons Lehre von der Wahrheit* 1943 ; *Alétheia* in *Vortrâge und Aufsätze* 1954. La question est bien résumée par J. P. Levet, *Le Vrai...*, op. cit. pp. 48-51.

(170) Le terme apparaît sept fois dans l' *Odyssée* (on trouvera le relevé des occurrences chez J. P. Levet, *ibid*. p. 59) et seulement deux fois dans l' *Iliade* : en XXIV 407 (avec καταλέζω), et dans un passage de la course de chars en XXIII 361.

(171) "ΕΤΥΜΟΣ und ΑΛΗΘΗΣ", Krischer, T. (1965) “ΕΤΥΜΟΣ und ΑΛΗΘΗΣ,” Philologus 109: 1965, p. 164.

(172) *Ibid*, p. 162. Ainsi, en *Iliade* XIII 272-273, le verbe καταλέγειν a pour antonyme ἰδμεναι dont le rapport sémantique avec la perception visuelle est bien connu. G. Nagy, dans un article où il s'intéresse précisément à certains passages du chant XXIII de l' *Iliade*, montre que l'expression ουδἔ με λησει y est souvent utilisée comme synonyme de νομσω), verbe de perception qui exprime simultanément "the noticing of signs and the recognition of what they mean" ("*Sêma and noesis*...", art. cit. 1983, p. 38).

(173) Cette interprétation inspire aussi les analyses de M. Finkelberg qui substitue à l'idée de dénombrement celle de succession narrative ("Homer's view of the epic narrative : some formulaic evidence", *Classical Philology* LXIII 1987, p. 138) : "The ordered succession was regarded as the form of a truthful narration and the truth as the content of a point-by-point narrative succession". Elle conclut son étude en affirmant que pour Homère, la "narration catalogale" constitue "le modèle formel de toute narration véridictive" (p. 138). Or nous avons pu établir au fil de cette étude que καταλέγειν ne désigne en toute rigueur ni un dénombrement, ni une narration, encore moins un modèle narratif de véridicité.

Hésiode

Théogonie. Les travaux et les jours. Le bouclier - Paris, Belles Lettres, 1928 (réédition 2002)

ἴδμεν ψεύδεα πολλα` λέγειν ἐτύμοισιν ὁμοι^α,

ἴδμεν δ', εὖτ' ἐθέλωμεν, ἀληθέα γηρύσασθαι.

"si nous savons dire bien des mensonges qui ont tout l’air d’être réalité

nous savons, quand nous le voulons, faire entendre des vérités"

(Hésiode, *Théogonie et autres poèmes suivi des Hymnes homériques*, Édition de Jean-Louis Backès, Paris : Gallimard, 2001, vv. 27-28)

"La Vérité et le Mensonge.

Le "vrai et le "faux" en tant que compléments de verbes énonciatifs, indiquent le conformité (ou la non-conformité d'un énoncé aux choses.

Pour dire qu'un énoncé est vrai, Hésiode dispose de deux termes. Le premier, employé deux fois, se présente sous les formes ἐτυμος et ἐτητυμος, cette dernière variante comportant, selon Chantraine, un redoublement expressif (204). Ces termes désignent des paroles conformes à la réalité (205), au point qu'on a supposé une origine commune du terme avec εἶναι et suggéré un type d'exactitude vérifiable dans la réalité sensible (206. On observe en effet cette conformité aux choses dans les développements des *Travaux* que le poète a annoncés comme des ἐτήτυμα destinés à instruire Perses de ses devoirs. Ces paroles exactes sont le fait du poète et des Muses, même si le vers 27 de la *Théogonie* les intègre au "savoir dire" des déesses au prix d'un détour par les mensonges "de même valeur que des paroles véridiques".

La valeur d'αληθής, "non caché", a fait l'objet de discussions. Pour certains, l'adjectif désigne une qualité des choses : dire des ἀληθέα signifie "reproduire dans un discours quelque chose qui existe sans se dissimuler (qui se révèle) au monde (207). Pour d'autres, il s'agit d'une qualité de la formulation, "dire la vérité de manière que l'objet qu'on a en vue ne demeure plus caché" (208). Je ne suis pas sûre qu'il y ait lieu de choisir : "dire le vrai nom" d'un jour, par exemple, suppose que ne soient cachés ni les actes auxquels il est propice ni sa désignation exacte. Pour Detienne, est ἀληθης ce qui n'est pas de l'ordre de l'oubli (λήθη) et relève de la mémoire (209). Cette valeur de l'adjectif est rendue particulièrement visible dans son emploi à propos de Nérée, dit à la fois "sincère" (ἀληθης) et "n'oubli(ant) pas" (ουδε λήθεται) la justice (210). Elle ne contredit pas celle de "non caché", mais la complète : l'une et l'autre répondent aux sens attestés chez Hésiode pour les verbes λανθάνω, λήθω et ἐπιλήθω qui signifient à l'actif "être caché, échapper à la connaissance" et peuvent prendre au moyen la valeur d' "oublier" (211). Dans les cas où ces "vérités" renvoient à un énoncé, elles sont compléments des verbes signifiant "dire le nom" et "faire connaître par la voix" (212), qui supposent un savoir préalable que la parole rappelle ou révèle ; il n'y a pas de dévoilement sans mémoire et, si Hésiode accorde à cette dernière une place de choix dans la révélation du vrai, cela tient à sa conception de la parole poétique dont il sera question plus loin (213).

Ces termes exprimant diversement 1a vérité sont employés dans le sens qu'ils ont déjà chez Homère, où, quand ils sont impliqués dans

des situations d'énonciation, les mots ἀληθης et αληθείη supposent un exposé complet, un compte-rendu sans dissimulation (214) ; ἐτήτνμος s'applique à des paroles qui disent les choses comme elles sont (215) et s'oppose au non réalisé (216).

Cependant la qualité de vrai, chez Homère, concerne des propos que l'on exige ou tient présentement. Elle ne prend jamais la valeur générale que les constructions hésiodiques lui assignent : les "paroles véridiques" que le poète va "dire" désignent le poème dans son ensemble ; les "vérités" que les Muses savent "proclamer" semblent n'avoir d'autre limite que leur bon vouloir.

Il en va de même pour le faux, que les textes homériques appliquent au contexte étroit alors qu'Hésiode fait des Pseudéa des divinités emblématiques. On relève en outre une différence sémantique entre les deux poètes. Chez Homère, ψευδεα peut désigner l'erreur de bonne foi (217) ou un acte (la violation d'un pacte) (218). Aucun de ces deux sens ne figure chez Hésiode : les contextes supposent toujours une situation verbale et une distorsion consciente de soi. Le mensonge caractérisé est néanmoins plus net dans le verbe que dans le nom : le faux témoignage et la vantardise auxquels le verbe est associé dans les *Travaux*, la sévérité de la punition à laquelle expose le mensonge divin appuyé d'un parjure, donnant lieu à un exposé de plus de vingt vers dans la *Théogonie*, sont l'objet d'une dénonciation claire (219). Le nom "mensonges", quant à lui, semble, comme les λόγοι auxquels il est associé trois fois sur quatre (220), constituer une catégorie de talents rhétoriques dont l'effectuation précise n'est pas véritablement prise en compte. C'est évidemment le cas pour les puissances emblématiques descendant de Nuit, les frères Pseudéa et Logoi. Chez la femme, les "mensonges et discours trompeurs" s'intègrent dans la liste des qualités qui lui sont conférées à titre permanent lors de sa création. L'homme né le sixième jour sera beau parleur en toutes catégories : railleries, mensonges, discours trompeurs et furtifs. Dans les deux cas où ψευδεα et λόγοι sont employés séparément, chez les Muses et chez Zeus, ce caractère de généralité s'estompe. Les "discours trompeurs" de Zeus à Métis s'intègrent dans un épisode précis où un but leur est assigné (221). Les distorsions constitutives du savoir des Muses sont limitées par la vérité à laquelle elles sont reliées syntaxiquement et sémantiquement.

Mis en situation, ψεύδεα et λόγοι s'en vont dans des sens divergents. Chez Zeus, la tromperie l'emporte sur le discours, réduit à l'état de moyen. Chez les Muses, sont mis au premier plan, avec l'expression ιδμεν...λέγειν, la parole et le savoir, mais aussi la valeur de vérité de ces ψευδεα ετυμοισιν όμοἰα. Contrairement aux ἀληθἐα, indéterminés et ainsi absolus, les "mensonges" s'inscrivent dans l'horizon de la vérité et se définissent par rapport à elle. Il paraît raisonnable de leur attribuer la valeur de "fictions" mentionnée par Chantraine (222). Il serait en effet paradoxal de supposer qu'au moment même de son initiation, le poète prête aux Muses qui le légitiment une intention aussi manifestement contraire aux prétentions véridiques qu'il affiche. D'autre part la notion de "mensonge" se définit par la convergence de deux champs de signification qui peuvent être indépendants : l'intention d'induire en erreur sur le fond et l'inexactitude des paroles. Plusieurs emplois homériques mentionnés plus haut ne retiennent que la seconde acception. Rien n'interdit à Hésiode de choisir le cas de figure inverse : des distorsions intentionnelles au plan du récit sans intention de tromper sur le fond, et comportant au contraire, sous le contrôle du savoir des Muses, l'intention de ramener à la vérité. Des fables, par exemple, que même des têtes dures peuvent comprendre. Nous y reviendrons.

Ainsi les deux noms qui, chez les hommes, nomment une qualité générale, présentant le double caractère de la tromperie et de l'habileté rhétorique, se spécialisent-ils chez les dieux dans l'un ou l'autre registre tout en conservant plus ou moins à l'amère-plan la deuxième partie de leur sens. Inversement, la proclamation des vérités par les Muses a toutes les apparences d'une qualité générale. Il semble donc y avoir au moins la trace d'une différence entre hommes et dieux dans l'aptitude à dire vrai ou faux." (pp. 67-72)

Notes

(203) En *Th*. 233, l'adjectif prend la valeur de "franc". Il s'agit d'une qualité de Nérée et non d'une énonciation. Il en va de même pour ἀψενδὴς (*ibid*.).

(204) Chantraine, 1968, s.v. ἐτὸος. Lüther, 1935, p. 51 ss.

(205) Chantraine, ibid. ; Pucci, 1976, p. 12.

(206) Krischer, 1965, p.166. Verdenius, 1962, p. 119, estime que les "vérités", au vers 10 des *Travaux*, suggèrent que la *Théogonie* n'a pas dit toute la vérité.

(207) Heitsch, 1962, p. 24-33 ; 1966 b., p. 193-235. Voir les remarques de Detienne, 1967, p. 48, 147. Ultérieurement Hommel, 1969. C'est la notion heideggerienne de *Unverborgenheit* ; voir par exemple *Sein und Zeit*, 1927, trad. fr. Vezin p. 270-271, et la conférence intitulée *Aletheia* des *Vortrage und Aufsätze*, trad. fr. *Essais et Conférences*, Paris, 1958.

Extrait de : Marie-Christine Leclerc, *La parole chez Hésiode. À la recherche de l'harmonie perdue.* Paris : Les Belles Lettres 1993.

"Celui-ci [Hésiode] fait en effet précéder le proème traditionnel de la Théogonie (v. 104-115) d'un autre proème, plus développé (v. 1-103), qui indique l'horizon de préoccupation à partir duquel l'héritage épique se trouve à la fois assumé et dépassé. La logique de cette mise

en perspective réfléchissante, dont la complexité et la virtuosité technique ont souvent été remarquées (3), est résumée dans l'adresse des Muses (v. 26-28) qui prélude au sacre du poète.

Hésiode y distingue les réalités fictives (*pseudéa*), qui naissent de l'imitation parfaite des réalités sensibles *(etuma)* dans l'élément du langage, des réalités vraies *(alétheia),* qui semblent relever d'un autre registre de la parole. Cette distinction n'instaure cependant pas, comme on l'a souvent soutenu, une opposition franche, voire polémique, entre la poésie didactique, que revendiquerait Hésiode, et la fiction traditionnelle, représentée par Homère. En effet, rien ne permet de penser que les Muses réservent à Hésiode une moitié seulement de leur double pouvoir. Bien au contraire, le fait même qu'elles rappellent leur habileté à forger des fictions, avant de faire état de leur capacité de proférer, à leur gré), des vérités, suggère qu'il existe un rapport étroit entre les deux registres de l'invention pure et de la connaissance.

La qualité cognitive exprimée par l'adjectif αληθής [*aléthes*] a été cernée à partir de deux hypothèses diamétralement opposées. La première est parfaitement représentée par l'article d'E. Heitsch, qui s'inspire de l'interprétation heideggérienne du terme (4). Partant de l'étymologie probable (ἀ-ληθη), qui indique quelque chose comme la suppression (α-) de l'état de non-perception (ληθη), l'auteur donne à la notion d'ἀληθείἰα le sens de "révélation" ou de "manifestation". Serait alors αληθής ce qui fait irruption dans l'univers des représentations familières pour y introduire une dimension méconnue du réel. La seconde hypothèse est défendue par H. J. Mette (5). Suivant son analyse, est ἀληθης ce qui est toujours déjà présent, mais échappe seulement à mon attention. En effet, le verbe λανθανω ne signifie pas que j'ignore ce qui va se révéler ou se manifester en surgissant d'un ailleurs absolu, mais plutôt que je n'ai pas conscience de quelque chose qui est déjà là, pour ainsi dire sous mes yeux, et qui m'échappe parce que je me trouve momentanément incapable d'y porter mon attention. L'enquête minutieuse que T. Krischer a consacrée à l'ensemble des occurrences d'αληθήςς et d'ἐτυμος dans Homère (6) étaie les conclusions de Mette. Si ἐτυμον désigne, en accord avec l'étymologie (cf. εταζο), une réalité susceptible d'être vérifiée par un critère objectif et quasiment

"expérimental", αληθής, au contraire, évoque une réalité qui n'est pas vérifiable par un critère extérieur, mais qui s'impose immédiatement à la conscience. Ce qui frappe ainsi l'esprit ne saurait être confondu avec les données brutes de la sensation, même si la qualité particulière de la perception dite vraie prend appui sur une réalité d'abord présente dans les sens. De là s'explique que le terme d'ἀληθης ne sert pas tant à caractériser les faits eux-mêmes que le contenu du discours qui les rapporte. Dans la formule homérique "dire la vérité", l'accent est mis sur l'exactitude et l'exhaustivité du discours qui traite son objet sans rien ne déformer ni omettre. Les réalités dites vraies appartiennent à la réalité seconde du discours, par opposition aux réalités sensibles auxquelles il se réfère. La parole devient le seul garant des choses qu'elle recense quand celles-ci échappent au contrôle direct, en raison de leur éloignement dans l'espacez ou de leur inscription éphémère dans le temps (8).

Ce dispositif conceptuel relativement simple, qui oppose les réalités appartenant à l'expérience sensible à leur restitution fidèle dans le discours, se trouve compliqué par l'existence d'un registre de la parole qui vient s'interposer entre l'un et l'autre type de certitude. Le caractère plausible des fictions mensongères d'Ulysse (9), qui permet au récit homérique tout entier de se refléter dans l'adresse inventive de son héros, fait découvrir une dimension du langage dont l'efficacité se confond avec l'essence même de la narration. Celle-ci est l'apanage premier des Muses, qui soumettent les ressources infinies de l'imagination au principe régulateur de la mémoire. Or l'univers ordonné de la fiction narrative creuse comme un écart avec le monde de l'expérience sensible et permet de redéfinir et d'approfondir la notion de la vérité.

C'est ce que fait Hésiode quand il prête aux Muses, outre le pouvoir d'imiter les réalités sensibles, la faculté de dire le vrai. En effet, les réalités dites vraies (ἀληθεα) se dégagent, à condition d'y prêter attention, du mouvement même de la fiction comme autant d'effets de signification dont l'évidence, purement intellectuelle, relève de l'ordre de la connaissance. Alors que les réalités sensibles (ετυμα) sont à la portée de tous les hommes, même des plus frustes, comme les bergers que vise l'invective du vers 26 et dont le ventre constitue la principale instance de vérification, l'appréhension des significations suppose l'acculturation à l'aide de la fiction, qui fournit

le support nécessaire à leur élaboration. Ainsi, la *Théogonie* se trouve définie comme une œuvre qui, avec les moyens de la fiction, déploie des significations vraies que la philosophie continuera à travailler pour en tirer ses systèmes.

Si le discours philosophique s'éloigne progressivement de la fiction, en passant de la cosmogonie à la cosmologie, puis à l'ontologie, le récit théogonique reste attaché à l'évocation fictionnelle d'événements s'inscrivant dans l'expérience sensible du monde, tout en faisant apparaître un ensemble d'articulations noétiques qui ne sauraient être vérifiées par les sens. Ces choses vraies, qui ne sont pas encore la vérité des philosophes mais qui l'annoncent, se présentent sous la forme d'un certain nombre d'implications conceptuelles (mises en relief par l'analogie et la répétition) qui confèrent aux événements relatés le statut réglé de la signification." (pp. 17-19)

Extrait de : Heinz Wismann, "Propositions pour une lecture d'Hésiode". In *Le métier du mythe. Lectures d'Hésiode*. Édité par

Fabienne Blaise, Pierre Judet de la Combe, et Philippe Rousseau - Villeneuve-d'Ascq, Presses Universitaires du Septentrion 1996.

"Il ne me semble pas suffisant d'établir que l'on peut interpréter l'adjectif *alèthés* comme signifiant "vérifiable" au sens étymologique où le mot nie l'idée d' "échapper à la conscience" implicite dans la racine dont il est dérivé, *lèth-*, de *léthé* "oubli" et *lanthánô* "échapper à la conscience de" (21). Il est vrai qu' *alèthés* exprime l'idée de voir quelque chose "pour de vrai" mais il y a plus que cela : nous devons examiner de quelle manière la négation de *léth-* sert d'équivalent au concept positif *me-*. La clé se trouve dans le fait que *mnè-* ne signifie pas seulement "se souvenir" mais très précisément "recouvrer l'essence de l'être" comme l'a montré Jean-Pierre Vernant (22). Dans l'ancienne pensée mythique grecque une telle essence est au-delà de la réalité sensible, au-delà du temps (23). Et surtout, comme Marcel Detienne l'a montré, l'ancienne tradition grecque affirme que cette essence est contrôlée par le poète, maître de "vérité" ou *alétheia* (24).

Reste un problème : au vers 28 de la *Théogonie*, *alêthéa* n'est pas opposé à *léthè* mais à *pseûdea* "choses fallacieuses" dans le vers précédent. On a soutenu que cette antithèse représentait " une manière de pensée plus tardive, plus rationnelle, dans laquelle *alétheia* signifie 'vérité' " (25). Tout se passe comme si une opposition nouvelle, d'esprit rationaliste, entre *alêthéa* "choses vraies" et *pseûdea* "choses fallacieuses" se surimposait à une opposition plus ancienne, mythique, entre *alétheia* pris au sens de "non-défaillance de la conscience" et *léthé* "défaillance de la conscience", avec le résultat que les deux oppositions se chevauchent et coexistent en fait (26). Et l'on a soutenu de surcroît qu'il se produisait même un chevauchement entre *alétheia* et *léthê* aussi bien qu'entre *alêthéa* et *pseûdea* au point qu'aucun acte de mémoire n'est exempt d'une certaine mesure d'oubli, aucune expression de la vérité exempte d'une certaine tromperie (27). J'accorde qu'il existe bien un schème de pensée dans lequel *mnê-* au sens de "se souvenir" inclut un aspect de *léth-* "oublier " (28). Mais je ne suis pas d'accord pour autant avec l'idée que l'adjectif *alèthés* et le nom *alétheia* se comportent de même ; tout au contraire, comme je l'ai montré longuement ailleurs, *arêtes* et *alétheia* excluent explicitement une inadvertance de l'esprit (29).

L'absence d'ambiguïté, voire la valeur absolue, des mots *alèthés* et *alétheia* explique qu'ils dénotent un acte de parole et de fait, à son tour, explique l'autorité et le pouvoir d'autoriser qui s'attachent à leur force illocutoire." pp. 45-47

(21) Cole, "Archaic Truth", Quaderni Urbinati, n.s. 13, 1983, p. 7-28, donne un exposé admirable de la sémantique d' *aléthes* et des interprétations proposées dans lequel il rejette la thèse heideggérienne qu'une valeur "objective" de la vérité est inhérente au mot (la vérité non "cachée" dans ce qui est perçu). L'interprétation propre de Cole est une reformulation de solutions plus anciennes insistant sur une valeur de vérité "subjective" (la vérité non "oubliée" par celui qui perçoit). Il suggère (p. 12) que " l'oubli exclu par *alétheia*a concerne au premier chef le processus de la transmission -- et non l'appréhension mentale sur laquelle repose la transmission". Par suite *alétheia* "ne désigne pas seulement la non-omission d'éléments d'information du fait de l'oubli, du manque d'attention ou de l'ignorance, mais aussi le fait de ne pas oublier d'une minute à l'autre ce qui a été dit quelques minutes auparavant et de ne pas laisser passer quoi que ce soit de dit ou de non-dit sans être conscient de ses conséquences et de ses implications " (p. 12).

Extrait de : Gregory Nagy, "Autorité et auteur dans la *Théogonie* hésiodique". In *Le métier du mythe. Lectures d'Hésiode*. Édité par Fabienne Blaise, Pierre Judet de la Combe, et Philippe Rousseau - Villeneuve-d'Ascq, Presses Universitaires du Septentrion 1996. pp. 41-52.

"La profondeur et le sérieux de la réflexion à laquelle Hésiode soumet l'héritage épique traditionnel, tant en ce qui concerne le patrimoine expressif que le réseau complexe des valeurs et des idéaux ou, encore, les principes de la poétique propre à l'épopée, sont désormais des réalités bien établies (1). Dans ces conditions, la reprise quasi littérale du vers 203 d' *Odyssée* XIX, "Il fit paraître de nombreux mensonges semblables aux réalités", par le vers 27 de la *Théogonie*, "Nous savons dire de nombreux mensonges semblables aux réalités" peut, je crois, trouver une explication convaincante (2). Il est en effet légitime de se demander encore une fois quelle intention définie sous-tend la référence au texte homérique, à ce texte homérique précis : la référence à *Odyssée* XIX, v. 203 -- qui intervient dans un contexte polémique et dont il est difficile de penser qu'elle ne soit pas polémique elle-même -- n'a-t-elle qu'une valeur indicative, c'est-à-dire ne sert-elle qu'à désigner toute la poésie homérique -- ou, pour le moins, la tradition de la poésie héroïque --, ou bien peut-on y déceler des objectifs plus précis et plus circonscrits, et si oui, lesquels ?

La possibilité ou l'impossibilité de saisir les intentions d'Hésiode constitue selon moi le nœud du problème. Renoncer à définir l'objet de la polémique contenue dans le vers 27 (l'épopée dans son ensemble ou une partie ou un élément de l'épopée) reviendrait en effet à admettre qu'Hésiode n'a indiqué aucun critère qui permette de définir la part de mensonge et la part de vérité qui entrent selon lui dans ce type de production poétique. Autrement dit, si l'on n'établit pas une référence précise, hors de l'œuvre d'Hésiode, pour Théogonie, v. 27, il faut alors accepter comme présupposé fondamental et contraignant pour toute interprétation de son œuvre

qu'il lui est impossible de sortir d'une situation d'incertitude entre mensonge et vérité, puisque les Muses peuvent inspirer aussi bien l'un que l'autre. Ce serait une position parfaitement légitime si chez Hésiode pris dans sa totalité, c'est-à-dire du premier vers de la Théogonie au dernier vers des Travaux, ne se manifestait pas la conscience claire et sûre de connaître la vérité et de posséder les moyens de l'enseigner à autrui (3). Nier cela revient à méconnaître le trait caractéristique de la poésie d'Hésiode, à savoir son intention didactique." (pp. 53-54)

Notes

Il n'est pas inutile de rappeler que j'ai déjà discuté ailleurs plusieurs des problèmes présentés dans ce texte, notamment dans les soixante premières pages de mon livre *Poeti, eruditi e biografi. Momenti della riflessione dei Greci sulla letteratura*, Pise, 1987 (Biblioteca di studi antichi, 52). Mais si ce travail suppose les développements que j'ai présentés dans cet ouvrage, je ne cherche pas à donner ici un résumé ou une répétition de ces pages, mais plutôt un prolongement et une confirmation des hypothèses que j'y propose. Par ailleurs, j'aborde ici des textes et des problèmes parmi les plus discutés par la critique hésiodique, et la bibliographie qui les concerne est très abondante. Je n'ai donc pas cru nécessaire d'exposer tous les travaux des autres (ce que j'ai fait ailleurs) ; les indications bibliographiques que je donnerai seront donc limitées aux recherches qui m'ont paru les plus significatives pour les questions que j'aborde ici. Il vaut la peine de signaler qu'entre-temps est paru le livre important de Marie-Christine Leclerc, *La Parole chez Hésiode* (Collection d'Études Anciennes, 121, série grecque), Paris, 1993, qui traite beaucoup de problèmes analogues à ceux qui sont discutés ici. Je voudrais, enfin, exprimer ma gratitude à Pierre Judet de La Combe, qui a traduit mon texte (publié, avec quelques modifications, dans : *Athenaeum*, n.s. 80, 1992, p. 45-63)."

(1) Voir G. Arrighetti, *Poeti, eruditi e biografi*, 1ère partie, chap. 1, et également G. A. : "Notte e i suoi figli : tecnica catalogica ed uso dell'aggettivazione", dans : *Tradizione e innovazione nella cultura greca da Omero all'età ellenistica*, Scritti in onore di Bruno Gentili, vol. I, Rome, 1993, p. 101-114.

(2) Sur le rapport formel entre le vers 27 de la *Théogonie* et *Odyssée* XIX, V. 203, voir par exemple H. Neitzel, *Homer-Rezeption bei Hesiod* (Abhandl. Kunst-, Musik-, Literaturwissenschaft, 189), Bonn, 1975, p. 8-10, avec la bibliographie. Il ne fait maintenant plus de doute, je crois, qu'avec le vers 27 Hésiode fait allusion à la production poétique des autres, par opposition à la sienne, et qu'avec le vers 28 il attribue à sa propre poésie le mérite de la véridicité. C'est le sens le plus clair et le plus évident que suggèrent les vers 26-28, et que confirme l'ensemble des contenus de l'œuvre d' Hésiode.

Cependant, pour établir cela encore une fois, il a fallu tout l'effort déployé par Neitzel dans son article d'Hermes 108, 1980 (p. 387-401). Pour ce qui est de la polémique contre les autres poètes, je suis absolument convaincu qu'Hésiode suppose chez ses destinataires une connaissance précise de l'épopée homérique ; voir sur cette question, J. U. Schmidt, Würzburger Jahrbücher, n.s. 14, 1988, p. 41 s. Schmidt fait également remarquer (p. 44) que les termes employés par les Muses au vers 27 sont une mise en garde de caractère général concernant toute poésie composée en leur nom. C'est vrai, mais la cible de la polémique, au vers 27, se laisse plus précisément identifier et circonscrire.

(3) La tentative de K. Latte (*Kleine Schriften*, Munich, 1968, p. 71-73) de définir en quoi la vérité d'Hésiode s'oppose à l'épopée doit être prise au sérieux, même si elle ne satisfait pas entièrement. Cette vérité serait la conscience, permanente chez Hésiode, de la mission d'enseignement de sa poésie et se manifesterait dans l'attention qu'il prête à la réalité concrète de la vie humaine : "la vérité que la Muse sait transmettre... est... la relation à sa propre existence". C'est vrai, mais cela ne vaut quasiment que pour les Travaux.

Extrait de : Giovanni Arrighetti, "Hésiode et les Muses. Le don de la vérité et la conquête de la parole". In *Le métier du mythe. Lectures d'Hésiode*. Edité par Fabienne Blaise, Pierre Judet de la Combe, et Philippe Rousseau, Villeneuve-d'Ascq, Presses Universitaires du Septentrion 1996. pp. 53-70.

Hérodote

"Dans les Histoires, le champ lexical de l' *alêthéia* se compose de 81 occurrences : 28 du substantif lui-même, 17 de l'adverbe *alêthéôs*, 34

de l'adjectif *aléthês* et 2 du verbe *aléthizomai* (333). Or Hérodote n'emploie ce vocabulaire qu'à quinze reprises dans des déclarations d'une portée généralement limitée. Ces déclarations se répartissent en effet en quatre catégories : ce sont ou bien des réserves sur la réalité du fait discuté et cela par neuf fois ; ou des "opinions de vérité (334)", dans deux cas ; ou encore, et à deux reprises, des précisions érudites de pur détail qui n'engagent nullement l'ensemble du développement dans lequel elles s'insèrent ; ce sont enfin des assertions hésitantes, dans deux cas seulement.

Examinons de plus près les passages ainsi répartis. Les réserves prennent parfois la forme de suppositions. Au lieu de s'interroger sur la réalité du fait, l'enquêteur adopte l'attitude surprenante qui consiste à faire l'hypothèse de son existence, afin de poursuivre une réflexion sur les modalités de sa réalisation ou sur ses conséquences. Il écarte ainsi une question qu'il ne peut ou ne veut résoudre -- celle de savoir si le fait s'est réellement produit -- et préfère examiner comment il s'est déroulé et ce qu'il a entraîné -- à supposer qu'il se soit produit.

La fondation conjointe de deux oracles de Zeus, l'un en Libye et l'autre à Dodone, en Grèce, fait, comme nous l'avons vu précédemment (335), l'objet de deux récits que l'enquêteur combine pour élaborer sa propre version des événements (11, 56). Et, de toute évidence, il est plus préoccupé de conduire cette synthèse que d'en prouver le fondement, entendons l'origine thébaine des oracles, et l'enlèvement perpétré par les Phéniciens, lorsqu'il déclare en introduction : "Quant à moi, je suis de l'opinion que voici. Si véritablement les Phéniciens enlevèrent les femmes consacrées et allèrent vendre l'une d'elles en Libye et l'autre en Grèce, je pense que cette dernière fut vendue..." Suit l'évocation du déroulement de cet événement dont l'existence même pose problème. Notons cependant que tout ce passage est placé sous le signe de l'opinion (*gnômé ; dokéei moi*). S'agit-il de la fontaine de jouvence des Éthiopiens "Longue-vie" ? Il suppose qu'elle existe réellement pour traiter de ce que produirait son éventuelle existence : la longévité du peuple qui utiliserait ses eaux. "Si cette eau est vraiment à leur disposition telle qu'on le dit, prend-il soin de déclarer, ce pourrait être grâce à elle que, s'en servant de façon constante, les Éthiopiens ont une longue vie" (111,23).

Il en va un peu différemment du chapitre IV,195, car, après avoir émis des réserves sur la réalité du fait, comme dans les cas précédents, l'enquêteur ne se résout pas à n'en rien pouvoir dire et à dévier sa recherche. C'est pourquoi il demande au raisonnement analogique de pallier les carences de son information et de le conduire, sinon à l' *alêthéia*, du moins sur la voie de celle-ci. Ce passage offre l'exemple exceptionnel dans les Histoires d'une recherche dans laquelle l'enquêteur place l' *alêthéia* en point de mire, tout en avouant qu'elle reste hors de sa portée et qu'il n'établit que du vraisemblable. Il fait un effort analogue pour évaluer le récit qui veut que le plongeur Skyllias de Skionè ait déserté chez les Grecs en plongeant aux Aphètes pour ne refaire surface que quatre-vingts stades plus loin, à l'Artémision (VIII,8). Après l'avoir mis en doute : "Je me demande avec étonnement si ce que l'on dit est véritable", il essaie cette fois de montrer que ce récit est mensonger en alléguant les autres traditions qui courent sur le plongeur : "On raconte sur le compte de cet homme beaucoup de choses qui ont tout l'air de mensonges et quelques-unes qui sont vraies." Mais il n'arrive pas plus à démontrer qu'un fait et le récit qui le rapporte sont faux qu'il ne parvient à établir leur réalité/vérité ; aussi conclut-il sur un avis personnel montrant qu'à ses yeux l'histoire de Skyllias est une fable : "Pour cette fois, qu'il me soit permis de dire qu'à mon avis il gagna l'Artémision sur un esquif." Hérodote reste en deçà du mensonge comme de la vérité.

Ces quelques exemples donnent raison à W. Luther (336) pour qui l' *alêthéia* hérodotéenne a gardé le sens de celle que, dans l' *Iliade* (XXIII, v. 361), Achille attend de Phoenix, quand il place son compagnon à l'extrémité de la carrière de sorte qu'il puisse observer la course de chars, en graver le souvenir dans sa mémoire (337) et en faire plus tard le récit. Dans tous les cas, le mot renvoie à la réalité du fait considéré et à la fidélité du discours qui en rend compte. Mais, si ses autres occurrences ne nous apprennent rien de plus sur son sens, nous croyons en revanche qu'elles sont de nature à remettre en question l'idée, également soutenue par W. Luther, que toute la recherche hérodotéenne s'efforce d'atteindre l' *alêthéia* (338).

Ailleurs, le mot entre dans des formules qui mettent le fait étudié en doute, mais l'enquêteur ne tente plus de transformer en incertitude l'ignorance où il se trouve ou bien de détourner sa réflexion sur un

thème annexe pour éviter l'aporie. Il s'en tient à une manifestation de scepticisme. Il en est ainsi pour les récits qui prétendent que l'île égyptienne de Chemmis flotte (11,156), ou que le Perse Mégabatès avait une fille que Pausanias aurait volontiers épousée (V,32).

Enfin, dans les deux derniers textes qu'il nous reste à examiner dans notre première rubrique (IV,18 et 187), Hérodote, qui a fait mine d'affirmer la réalité d'un phénomène, s'empresse de relativiser la portée de son assertion comme s'il voulait atténuer une audace : "Au-dessus des Androphages commence un désert véritable sans aucune population humaine, autant que nous Ie sachions" (IV,18). "En vérité, les Libyens sont, de tous les hommes que nous connaissions, les plus sains" (IV,187).

Le vocabulaire de l' *alêthéia*, en ce qu'il figure dans des formules permettant à l'enquêteur de poursuivre ses récits ou ses réflexions sans se laisser arrêter par des connaissances insuffisantes, et parce qu'il témoigne aussi que ce dernier n'est pas dupe de ses informateurs ou de la puissance de ses propres capacités de recherche, dessine en somme une notion de vérité aux fonctions contrastées. D'une part, cette notion autorise des pratiques qui d'emblée l'ont évincée et ont renoncé à l'atteindre et, de l'autre, elle constitue le but inaccessible de l'effort de recherche. Mais, facteur de libération et d'expansion de la recherche ou concept essentiel d'une critique négative de la connaissance qui tente de s'élaborer, la vérité se dérobe toujours et se place constamment hors de portée de l'enquêteur." (pp. 165-167)

Annotated Bibliography on the Concept of Truth in Ancient Greek and Roman Philosophy

General studies on the History of the concept of Truth

1. Aenishanslin, Jean-François, O'Meara, Dominic, and Schüssler, Ingeborg, eds. 2004. *La vérité. Antiquité - Modernité*. Lausanne: Payot.
2. Allen, Barry. 1993. *Truth in Philosophy*. Cambridge: Harvard University Press.

   See in particular *Part One. Historical Introduction 1. Classical Philosophy of Truth* pp. 9-28*; 2. Modern Truth* pp. 29-37, for a brief sketch of the history of theories of truth.

   "I begin with a historical introduction. What I call the classical philosophy of truth is an ensemble of four interdependent ideas in ancient philosophy (Greek and Christian) concerning truth's relation to nature, language, being, and the good. Together they define the historical discourse on truth I call onto-logic. The first principle of onto-logic is that the "logical" possibility of sentential truth-value derives from the "ontological" possibility of beings that "are what they are," that have an identity of their own. For onto-logic, truth is true to such beings; it takes its measure from what is, whose nature truth discloses.

   In Part One, I look at versions of onto-logic first in Greek and Christian sources, then in modern philosophy. But it is not my intention to write the history of Western truth. The historical

studies in Part One merely establish some context for the discussion of six philosophers which follows: Nietzsche and William James (Part Two); and Heidegger, Derrida, Wittgenstein, and Foucault (Part Three)."

"Although truth belongs to the family of crucial philosophical categories, writing its general history still remains a serious challenge for historians of philosophy. Also historical accounts of particular truth-theories are rather fragmentary. Since the classical (also called 'the correspondence') theory of truth has become the most popular and influential among all hitherto proposed answers to the philosophical problem of truth, a lack of its written history is specially strange, more than in the case of their various rivals; this theory maintains, roughly speaking, that truth consists in a relation of correspondence (agreement, adequacy or conformity) which holds between so-called bearers of truth (judgements, ideas, thoughts, propositions, statements or sentences) and reality.

This paper presents a sketch of how the gap could be filled with respect to the classical concept of truth *(CCT* for briefly). It is just a sketch which by no means pretends to any completeness. The history of the classical (as well as every other) theory of truth requires taking into account at least four points, namely:

(A) Statements which have been explicitly intended as definitions (or other explications) of *CCT*.

(B) Formulations which could be interpreted as definitions (or rather explications) of *CCT* independently of the intentions of their authors.

(C) The philosophical environment of formulations collected under (A) and (B); it is especially important for cases falling under (B).

(D) Criticism of *CCT* and its defenses against raised objections.

I would like to touch each of (A)-(D) but my principal goal is to contribute to (A) and (B)." (p. 139 of the reprint).

   "Parmenides' philosophical work depends both on poetic features and on their transformation through critical analysis. His identification of the central role of deductive argument and thematic exploration of *to éon* grows from his engagement with poetry, and specifically from his view of *alétheia* as the orientation on a road to inquiry. A survey of the use of *alétheia* in archaic poetry (e.g., Homer, *Od*. 11, 507 ; Bacchylides 9, 81-87) shows that *alétheia* is opposed not only to falsehood, but also to *léthe* and its relatives; and illustrates the novelty of Parmenides' approach : by associating *alétheia* with a method of inquiry, Parmenides implies that there can be knowledge of something beyond what is available through observation, divine revelation, or reports."

    "The truth of the pre-Socratics is not the truth of integrity, of the monumental wholeness of the text of Homer and Plato. In

fact, we now know the monumental Homeric corpus to have its own fragmentariness, not the fragmentation of the Analysts, who wanted to discard parts of the received text as interpolations, but a sedimentation, a complicated series of origins, an unevenness due to its oral composition that prevents it from being what was once considered the seamless, intentional production of an "author." So from the beginning, as we approach the pre-Socratics' work, their aphorisms, bits and pieces recorded in later philosophers, traces of their reputation shaping even in their absence the work of others, we cannot yet-perhaps we can never- achieve a sense of coherence, of systematic development of philosophical ideas, such as is perhaps possible with the works of Kant or Hegel.

I want to approach the notion of truth in the pre-Socratics fragmentarily, then, by looking at truth in the fragmentary remains of the work of Herakleitos and Parmenides, two radically different thinkers. I have not attempted here to present an encyclopedic survey of all occurrences of alêtheia in Homer, Hesiod, all the pre-Socratics. Rather, I want to give a sense of a cultural paradigm, of the ways in which the word alêtheia works within a semantic field, in its contrasts, for example, with other words for truth, and as it fits into a cultural and social field of seeking out the genuine, the true. Herakleitos seems to offer a suggestive and idiosyncratic notion of truth that has certain affinities with the dialogical practices of the later democracy, while Parmenides' sense of truth is more compatible with the traditions of epic and of the consultation of oracles." (p. 96)

"Plato returns to the pre-classical notion of the *basanos* as a proof of loyalty and truth; but even more importantly, he presents both a paradigm of truth as recollection, the recalling of time -- buried truth -- and a paradigm of the production of truth through the *elegkhos,* the philosophical conversation, a version of truth as dialectic, as process, as the making of a truth in time, between people, not as the revelation of something lost in the past but as the production of something in the present. This latter element seems to me the trace of the democratic in

Plato, a trace that may be represented only to be disavowed within the larger corpus of Plato's arguments." (p. 107)

Résumé : "Dans cet article, je me concentrerai sur le concept de *ueritas* en lien avec la grammaire et la rhétorique à la fin de la République romaine, au moment où elles devenaient des disciplines indépendantes. D'un point de vue intralinguistique et « autonome », la *ueritas* peut être conçue comme un système conventionnel de procédures de vérification établissant une correspondance entre chaque unité et les règles analogiques.

Tel est l'arrière-plan sur lequel se découpent tant l'excursus grammatical de l'*Orator* de Cicéron que le *De lingua Latina* de Varron. Mais un autre point de vue, extralinguistique et hétéronome celui-là, figure également dans l'oeuvre de ces deux auteurs. Cicéron

élabore une théorie philosophique et rhétorique du *uerisimile*, afin de prétendre à la même force persuasive que celle que détiennent les choses elles-mêmes, autrement dit la réalité de l'évidence. Varron estime que la reconstruction d'un système totalisant, tel que celui du langage, gouverné par l'analogie, conduit à l'acquisition d'une vérité universelle qui peut être découverte par le biais de l'analyse morpho-étymologique des mots latins."

    Tome I. Présentation générale. Le vrai et le faux dans les épopées homériques.

    "Ce livre est la première partie d'une thèse de doctorat d'État qui a été sutenue le 11 mai 1974 en Sorbonne" (Avant-propos).

44. ———. 2003. "L'expression du vrai et de la vérité dans les *Posthomerica* de Quintus de Smyrne." In *Des Géants à Dionysos. Mélanges offerts à Francis Vian*, edited by Accorinti, Domenico and Chuvin, Pierre, 357-384. Alessandria: Edizioni dell'Orso.

45. ———. 2008. *Le vrai et le faux dans la pensée grecque archaique d'Hésiode à la fin du Ve siècle*. Paris: Les Belles Lettres.

    "Ce livre forme un ensemble avec la première partie d'une thèse de doctorat d'État soutenue à la Sorbonne en 1974 et parue en 1976." (Avant-Propos).

    "L'analyse lexicale de la conception et de l'expression du vrai et du faux fait apparaître, dans l'*Iliade* et dans l'*Odyssée*, l'existence d'un système ancien, qui repose sur des énoncés subjectifs se révélant conformes au réel objectif (familles d'*etéos, etmos,et etétumos, d'atrekéos et de ypertés*) ou procédant de l'invention de pures fictions (*pseudos, pseudomai)*.

Indépendamment de lui, l' *alethein* ancienne correspond à une révélation véridique prenant la forme d'un *non-voilé-dévoilant*.

Avec des prodromes déjà perceptibles chez Homère, la mutation de la psychologie de la connaissance tend progressivement à conduire à voir dans la vérité, dont le faux devient une déformation, le réel objectif connu, convenablement interprété par l'intelligence et fidèlement transmis.

Les catégories du faux et du vrai qui apparaissent alors relèvent dans le lexique de *pseudos* et d'*aletheia,* le terme, compatible, dès l'origine, avec la démarche décrite (un contenu objectif est communiqué), étant pourvu de nouvelles valeurs sémantiques. L'évolution est lente et considérable. Elle se fait par une série d'étapes successives.

D'Hésiode au Ve siècle, traits anciens et caractères nouveaux coexistent, mais petit à petit ceux-ci éliminent ceux-là. Un équilibre relatif est encore perceptible chez Hésiode, mais rapidement notions et mots archaïques s'effacent au profit de ce que représentent *alethés* et *aletheia*, *pseudos* et *pseudomai*, ainsi que les termes qui leur sont apparentés, tandis que se développent parallélement des concepts et des vocables nouveaux. Ils entrent dans les structures évoluées de la cognition et de la communication du *vrai* et du *faux* telles que *alethés* et *aletheia*, *pseudos* et *pseudomai* en montrent l'existence et la nature.

C'est l'histoire de cette évolution majeure, considérée comme formant un ensemble cohérent, que décrit le présent livre, dans la continuité de l'apport homérique, sur le fondement d'une étude sémantique menée à partir d'une analyse des textes littéraires, rédigés en vers ou non, d'Hésiode à la fin de l'âge archaique et avant la grande floraison de la prose classique.

Le critère permettant d'opposer *archaique* et *classique* est celui que fournit, au moins en ce qui concerne l'attique, la disparition de l'usage vivant des concepts les plus anciens et de leurs supports linguistiques." (Présentation Générale).

    "This is an essay about the ontological presuppositions of a certain use of ‘is’ in Greek philosophy — I shall describe it in the first part and present a hypothesis about its semantics in the second.

I believe that my study has more than esoteric interest. First, it provides an alternative semantic account of what Charles Kahn has called the 'is' of truth, thereby shedding light on a number of issues in Greek ontology, including an Eleatic paradox of change and Aristotle's response to it. Second, it finds in the semantics of Greek a basis for admitting what have been called 'non-substantial individuals' or 'immanent characters' into accounts of Greek ontology. Third, it yields an interpretation of Aristotle's talk of 'unities' which is crucial to his treatment of substance in the central books of the *Metaphysics*." (p. 113)

63. Santos, José Trinidade. 2004. "El nacimiento de la verdad." *Méthexis* no. 17:7-23.

    "This paper aims to outline the course of 'truth' in Plato's and Aristotle's works, where it begins as the veridical reading of *einai*, and ends as a function of *logos*. In Plato's Socratic dialogues truth has no methodological implications. The dialogues on the theory of forms sustain the polysemy of being, using truth as a means of establishing the consistency of arguments *Phaedo* 100a). The difficult coexistence of truth with infallibility (*Theaetetus* 152a-179c) leads to its emergence as a *poion* of *logos* (*Sophist* 263b). Aristotle's *De interpretatione* 1-6 points to a correspondence theory of truth, showing that only by affirming or denying logos is true or false."

    "II. In the context of the Bacchic mysteries, the bone tablets from Pontic Olbia open up space for theological meditation, documenting with direct sources from the mid-fifth century B.C. the belief in immortality seen darkly in the mania, the disembodiment of the concept of the soul, and an idea of truth so strong that it cannot be attributed only to a religion which defines itself in respect to others. Thus a new tessera can be added to the comprehension of the relation between Orphic

thought and the initiation rites in which the first philosophy takes root."

    "In the modern world truth is a fundamental intellectual and moral virtue. Courts of law demand, in a famous phrase, the truth, the whole truth, and nothing but the truth; statesmen must appear to be devoted to the truth; scholarly work is judged first on its truth and only thereafter for other qualities. The historian, for example, seeks to say true things, and hopes to guarantee the reputation of his work by amassing verified, precise detail, the hallmark of which is the learned footnote.

    Recently I have been investigating the origins of this attitude along with other aspects of the incipient historical spirit, during the archaic period of Greek history (700-500 B.C.). (1) To my surprise there seems to have been only limited consideration of what the Greeks in this era generally meant by truth '. Correspondingly, the fact that their ideas of truth often differed markedly from modern concepts has not been stressed, even though early Greek views on the matter had a lasting influence not only on ancient historiography but also on classical thought. The following remarks are intended as a sketch of the evidence which may hopefully encourage more intensive discussion; my intent, let me be clear, is to suggest how varied were the meanings of truth at the time, not to analyze their relations to modern epistemological theories.

    A cynic, indeed, might argue that here as elsewhere, the Greeks were simply more honest; for truth only slowly became a conscious, abstract virtue in Greek civilization, and never gained that unquestioned priority which we theoretically assign to it today. While Homer assessed the reality of events and distinguished' true statements from prevarications, the words which he and other early Greeks used to express these ideas initially lacked the absolute quality implicit in the modern truth ' and lie '. In time the verbal distinctions became theoretical and general; otherwise history and philosophy could scarcely

have emerged. Yet thinkers had a cankering fear that only the gods could really know the truth, and rarely felt passionately the need for truth.

By 400 B.C. - the boundary of this essay - two modes of establishing verity, the speculative and the empirical, had emerged, but so. too had conscious intellectual scepticism; only thereafter did epistemological analysis begin to develop. Perhaps even more devastating in its effects, as regards the mastery of the ideal of truth, was the emphasis upon form as a mode of evaluating the truth of a work."

75. Thiselton, Anthony C. 1978. "Truth." In *The New international dictionary of New Testament theology. Vol. III*, edited by Brown, Colin, 874-902. Exeter: Paternoster Press.

76. ———. 2006. "Does lexicographical research yield "Hebrew" and "Greek" concepts of truth? (1978) *and* How does this research relate to notions of truth today? (New summary)." In *Thiselton on hermeneutics. Collected works with new essays*, 267-286. Grand Rapids: William B. Eerdmans.

"Although this was originally written as a dictionary article, this work is neither merely didactic nor merely a lexicographical survey. With the editor's agreement it entirely replaced the German- language article that it was first designed only to supplement, The article in the German edition had presupposed the dichotomy between "Hebrew" and "Greek" concepts of truth in ways that were open to question in the light of both semantic theory (not least in the work of James Barr), and actual lexicographical research, which invited fresh evaluation. The inclusion of the classical and Old Testament backgrounds makes the fallacies of the older approach clearer. (...)

The article, comes from Colin Brown (ed.), The New International Dictionary of New Testament Theology, volume 3 (Exeter Paternoster Press, 1978), pp. 874-902, but has been abbreviated in order to omit material that may not bear directly on the argument. The breadth of lexicographical data might seem at times to verge on the tedious, but the argument depends on covering a fair range of specific cases and evidence, The original article concluded with a substantial discussion of modern philosophical theories of truth. This is too lengthy to retain here, but a brief summary has been rewritten for this volume (2004) to demonstrate the role of the argument for the "second horizon" of hermeneutics."

77. Tortorelli Ghidini, Marisa. 1990. "*Alétheia* nel pensiero orfico. I. "Dire la verità": sul v. 7 della laminetta di Farsalo." *Filosofia e Teologia* no. 4:73-77.

"I. The Homeric formula 'to tell the truth' involves the idea of starting from beginning and proceeding, point by point, to the end. In the Orphic Pharsalos tablet, that epic formula occurs again but the meaning turns out to be completely modified. According to this religious context 'telling the truth' and 'drinking at the spring of Mnemosyne' are identical: the truth, associated with a cosmic Memory, becomes a fundamental religious virtue. The link between religious and logical truth arises here."

78. Wolenski, Jan. 2005. "*Aletheia* in Greek Thought Until Aristotle." *Annals of Pure and Applied Logic* no. 127:339-360.

"This paper investigates the concept of *aletheia* (truth) in ancient philosophy from the pre-Socratics until Aristotle. The meaning of *aletheia* in archaic Greek is taken as the starting point. It is followed by remarks about the concept of truth in the Seven Sages. The author discusses this concept as it appears in views and works of philosophers and historians. A special section is devoted to the epistemological and ontological understanding of truth. On this occasion, influential views of Heidegger are examined. The paper is concluded by a review of various meanings of truth in Aristotle."

   Tome I. *Présentation générale. Le vrai et le faux dans les épopées homériques.*

   Avant-Propos: "Ce livre est la première partie d'une thèse de doctorat d'État qui a été soutenue le 11 mai 1974 en Sorbonne".

   "A la description de l'état homérique de la langue et de la pensée succédera, dans une seconde partie, une étude du vocabulaire historique. Cet examen accompli, il restera à depeindre l'évolution de chaque élément lexical jusqu'à la fin du Ve siècle, à travers le *Hymnes Homériques*, la poésie lyrique et élégiaque, les œuvres des poètes tragiques et comiques

anciens, les écrits d'Hérodote, de Thucydide et d'Antyphon, les fragments des Présocratiques et les passages du *Corpus Hippocratiique* que l'on peut dater du Ve siècle. On composera enfin une dernière synthèse résumant l'ensemble de l'évolution constatée et présentant l'état de langue et de pensée dont hérite le IVe siècle." (p. 5, note omise).

4. Daix, David-Artur. 2006. "Réalités Et Vérités Dans La *Théogonie* Et Les *Travaux Et Les Jours* D'Hésiode." *Métis.Anthropologie des Mondes Grecs Anciens* no. 4:139-164.

   "Et d'abord quelle est cette vérité que nous chante Hésiode ? Nous pourrions répondre qu'il s'agit à l'évidence d'une vérité "poétique", autrement dit d'une vérité qui s'exprime au sein d'une composition littéraire -- étant entendu que la nature orale de cette composition ne nuit en rien à son caractère littéraire --, d'un ensemble de récits auxquels nous donnons souvent le nom de "mythes", où l'imagination et la fiction tiennent une place prépondérante. Toutefois, cette réponse fait surtout ressortir l'écart entre la conception que pouvaient avoir Homère ou Hésiode d'un discours véridique et celle que développera un philosophe comme Platon ou, dans un autre registre, un historien comme Thucydide, qui l'un comme l'autre se méfient hautement des artifices poétiques, au point de souhaiter les censurer, voire les expurger. Mais elle ne nous apprend en rien ce qu'Hésiode lui-même entend par "vérité". p. 140

   (...)

   "Conclusion.

   Ni le mythe de Prométhée et de Pandora - qui, tel qu'il apparaît dans la *Théogonie* précisément, servirait à merveille le projet des *Travaux et les Jours* - - ni l'Éris iliadique n'ont perdu leur sens quand ils apparaissent au milieu des "réalités" qu'Hésiode rappelle à Persès. Mais ils sont en décalage par rapport à la perspective qu'adopte le poète et au monde qu'il veut célébrer.

   Hésiode redéfinit les notions de lutte et d'exploit, de querelle et d'envie. Et, de même, il modifie l'équilibre entre les récits sur lesquels s'appuie sa démonstration. Il n'échappe pas pour autant au poids de la tradition, mais il assure la pertinence de

son chant et se montre ainsi fidèle à ses patronnes, les Muses, "les filles à la langue habile du puissant Zeus" (29), dont les paroles sont toujours ajustées à leur propos, et au pouvoir dont elles l'ont investi.

La vérité est au coeur des préoccupations d'Hésiode. Toujours ses compositions prétendent la dire. Reste que cette vérité même pose problème, tant il est vrai qu'elle offre, paradoxalement, elle aussi, deux visages, selon qu'elle habite le temps des dieux ou celui des hommes."

5. Ferrari, Giovanni. 1988. "Hesiod's Mimetic Muses and the Strategies of Deconstruction." In *Post-Structuralist Classics*, edited by Benjamin, Andrew E., 45-78. New York: Routledge.

   "This essay has a narrow focus but a large penumbra. My focus is a current interpretation of the couplet spoken by the Muses in the prologue to Hesiod's Theogony, an interpretation avowedly influenced by the work of Jacques Derrida. I think it not just mistaken, but mistaken in an exemplary fashion. That is, in considering how it goes wrong I hope to reveal something more general about the impact of Derrida's work, actual and potential, bad and good, on classical studies. (This will eventually involve me in a quite detailed analysis of an exemplary piece by Derrida himself.) (1) In addition, I will offer the beginnings of an account of a significant and general pattern of archaic Greek thought evinced by Hesiod's couplet (one which has particular importance for the later development of Greek philosophy); a pattern which, I argue, is obscured by a certain pervasive anachronism that classicists engaged by Derrida have imported from his work."

   (1) " *Signature, événement, contexte*" and its companion piece " *Limited, inc. a b c...*" which I come to in the fourth section [both essay reprinted in: J. Derrida - *Limited Inc.* - Evanston, Northwestern University Press, 1988]

    "Au VIIe Chant [de l *' Odyssée*], Alcinoos donne un banquet en l'honneur d'Ulysse. "Laissez-moi manger dans ma détresse, dit Ulysse, car il n'y a rien de plus chien que le ventre odieux (*ou gar ti stugeréi epl gastéri kúnteron allo épleto*)" ; sans nourriture, Ulysse ne pourrait raconter ses aventures car, dit-il, son ventre lui "commande de manger et de boire" et lui "fait oublier" (*ek... léthanei*) ce qu'il a éprouvé. Or, la signification de la notion archaique d'alétheia, étudiée entre autres par Detienne, nous permet de faire l'observation suivante: loin de correspondre à notre conception de "vérité", 1'alétheia archeíque tend à garder son sens "étymologique" et signifie le "non-oubli" (a-létheia), de sorte qu'on pourrait dire d'Ulysse qu'il ne saurait dire l'a-létheia qu'à condition de recevoir à manger. C'est aussi le cas des trois Vierges dans l'Hymne homérique à Hermès qui après avoir mangé du miel blond disent volontiers la vérité *(alétheién agoreúein*)" tandis qu'elles "deviennent menteuses (*pseúdontai*)" aussitôt qu'elles en sont privées. (*)" p. 54

   "L'analyse de ces deux notions (le Vrai et le Faux) donne lieu à maintes conclusions. Citons, à titre d'exemple, deux réflexions. Or, contrairement au Faux -- sur le plan moral -- qui est toujours double *(diplóos)* ou même multiple, bariolé, sinueux, furtif, qui se tapit dans l'obscurité, la Vérité morale, elle, est toujours unique, simple *(aletós)*. Par ailleurs, ce qui m'a frappée au cours de mes recherches, c'est le fait que tandis que la vérité morale en tant que franchise, véracité, loyauté est claire, manifeste, ouverte à tous et dévoilée -- la vérité rationnelle-cognitive, elle, est cachée, difficile à trouver, invisible et insaisissable, résidant dans les profondeurs. Une autre observation -- que je partage avec M. Detienne (*) -- c'est le fait que le domaine du Vrai et du Faux se trouve gouverné --

dans toute la poésie archaïque grecque -- par deux lois fondamentales -- celle de la contradiction et celle de l'ambiguïté -- autrement dit, que ces notions résident dans un couple de contraires antithétiques et complémentaires." pp. 88-89

2. Moles, John L. 1993. "Truth and Untruth in Herodotus and Thucydides." In *Lies and Fiction in the Ancient World*, edited by Gill, Christopher and Wiseman, Timothy Peter, 122-146. Exeter: University of Exter Press.

   "In this discussion, I want to mediate between `literary' and 'historical' approaches to the question, primarily through a close reading of the prefaces of Herodotus and Thucydides (presented in my own very literal, and sometimes controversial, translations). What emerges, I think, from the content and form of these programmatic statements is the way in which 'literary' and 'historical' objectives are alike present and deeply interfused.

   On the one hand, both writers see themselves as inheritors of the tradition of epic narrative, especially as expressed in Homer's commemoration of a great war in the Iliad. Both writers also see themselves as developing the project built into Homer's poem (a project itself not without a certain `historical'

concern), namely that of analysing the causation and process of war and conflict, and of doing so by the invention of significant speeches and by the selection and presentation of concrete events. On the other hand, both writers also see themselves as engaged in a project which is distinctive from that of the poetic tradition in its attempt to establish factual truth and to distinguish this from factual 'untruth' or 'falsehood'.

Thucydides is more explicit about the nature and methodology of this project than Herodotus, and also about the kind of history (that is, primarily, recent history) in which this project can be pursued effectively. Indeed, in this respect especially, he presents himself as a critic, and rival, of Herodotus as well as a successor. But, in the prefaces of both historians, as in their full-scale narratives, we can recognize the combination of objectives (the perpetuation of epic narrative and interpretation and the innovative search for factual truth) that makes it so difficult to characterize their writings either in terms of 'literature' or 'history'. This combination also makes it difficult to characterize their work in terms of 'truth', 'falsehood' or 'fiction', though if we examine their own descriptions of their project, we have a better chance of seeing how these concepts match with theirs."

   "I begin by drawing three types of distinction between kinds of discourse. The first relates to the speaker's intended form of communication with a listener. This distinction involves two aspects: that between factual and fictional discourse, and that between forms of factual discourse. Factual discourse is intended either to convey to the listener what the speaker takes to be true (`veracious'), or to convey what the speaker takes to be false (`lying'). Fictional discourse is different in kind from factual: its statements (and other forms of expression) do not constitute truth- telling or lying, and in this sense fiction has no truth-status.

   The second type of distinction differs from the first in that it characterizes discourse by reference to whether it is in fact true or false rather than whether the speaker intends to convey what he or she takes to be true or false.

   The third type of distinction relates to the mode of expression. I have in mind such distinctions as that between analytic discourse and non-analytic (representative or narrative); between prosaic discourse (historical, philosophical) and poetic (epic, dramatic, lyric); between literal discourse and figurative (imagistic, musical); and between general and specific discourse. This type of distinction differs from the first two in several ways, notably in not designating truth-status in either of the senses involved in those distinctions. But I include this distinction here because the question of the truth-status of a given discourse is often connected closely with that of the mode of expression involved. Thus, for example, a given statement may be false (in intention or fact) on the literal level but true (in intention or fact) on the figurative level; or it may be false in a specific case but true in general. This is only the most obvious

way in which the distinctions drawn in the first two types may be connected with those in the third type.

My claim is that these distinctions, while broadly intelligible to modern readers, do not correspond in one crucial respect to the conceptual framework presupposed by Plato. The distinction between factual and fictional discourse, which is familiar to us, has no obvious equivalent in Plato's framework." pp. 39-40

10. Hestir, Blake E. 2000. "A Conception of Truth in *Republic* V." *History of Philosophy Quarterly* no. 17:311-332.

    "Plato sometimes refers to truth (*aletheia*) as an object. The thesis of this paper is that Plato's "object" truth is being, an object of knowledge. I provide an examination of the difficult stretch of text at "Republic" V 476e-480a, where Plato argues for the separation of knowledge, belief, and ignorance with respect to their objects. Plato claims that knowledge is "set over" being, by which he means forms. Since philosophers are lovers of the sight of truth and Plato thinks that in one respect forms are truth, it follows that the being knowledge is set over is truth."

11. ———. 2003. "A Conception of Truth in Plato's *Sophist*." *Journal of The History of Philosophy* no. 41:1-24.

    " Plato's solution to the problem of falsehood carries a notorious reputation which sometimes overshadows a variety of interesting developments in Plato's philosophy. One of the less-noted developments in the *Sophist* is a nascent conception of truth which casts truth as a particular relation between language and the world. Cornford and others take Plato's account of truth to involve something like correspondence; some find the origin of Aristotle's "correspondence" account of truth in Plato's *Sophist*. But all this assumes a lot about Plato, much less Aristotle. For one, it assumes that to claim that the statement 'Theaetetus is sitting' is true is to claim that it is true because it corresponds with the fact that Theaetetus is sitting.

Other scholars have been reluctant to accept Cornford's view, but few offer any explanation of what sort of account of truth we might ascribe to Plato by the end of the *Sophist*. Tarski has argued that truth is a simpler notion than that of correspondence. In fact, he claims his own "conception" of truth is similar to the classical conception we find in Aristotle's *Metaphysics* -- a conception of truth formulated in Greek in much the same way Plato formulates it in the *Sophist*. Unfortunately, Tarski never sufficiently explains what it is about the classical conception that makes it closer to his own. I argue that Tarski is generally right about the ancient conception of truth, but this is not to claim that Tarski's own conception is in Plato. By interpreting Plato's solution to the paradox of not-being and his solution to the problem of falsehood, I argue that Plato's account of truth implies a simpler notion of truth than correspondence. I outline various types of correspondence theory and show that none of these fits what Plato says about truth, syntax, and meaning in the *Sophist*."

12. ———. 2004. "Plato and the Split Personality of Ontological *Aletheia*." *Apeiron* no. 37:109-150.

    "I argue that Plato conceives of truth in at least two distinct and fundamentally important ways: (T1) truth is simply that being or substance which he identifies as forms, and (T2) truth is the ontological stability of the forms which is the precondition for the forms being what they are insofar as they are forms and for each form having the particular F-property it has by virtue of itself, and which guarantees that each form will satisfy the Parmenidean requirements for knowledge. Plato's ontological truth has a split personality, the latter of which (T2) I argue has been misunderstood."

    Contents: 1. The problem of the Socratic method; 2. The Coherence Theory of Truth; 3. The Coherence Theory within the Platonic corpus; 4. Coherence and anamnesis; 5. Socratic

ignorance and the Coherence Theory of Truth; 6. The uniqueness of the world; conclusion; Notes; Bibliography; Index.

14. Knight, Thomas. 1993. "The Use of *"Alétheia*" for the "Truth of Unreason": Plato, the Septuagint, and Philo." *American Journal of Philology* no. 114:581-609.

    "Orthodoxy about the semantic evolution of Aletheia in the Hellenistic period represents Philo Judaeus and Plutarch as the non-Christian representatives of a line of development beginning in Plato (where Aletheia is said to denote abstract, conceptual Truth, 'die Wahrheit') (1) and ending in the sense of absolute truth, specifically 'the content of Christianity as absolute truth.' (2) The problem of such a stemma is that it fails to stand up to close inspection; the present study considers one of the circumstances under which 'truth' was equated with doctrinal content in the Hellenistic period. (3) Specifically, I undertake to demark the distinction between 'truth' as Philo Judaeus understands it from 'truth' as it is used by the philosophers who are his stylistic and intellectual models; I intend to show that Philo's notion of pure truth is not a natural semantic extension of Platonic (or even contemporary philosophic) usage, but is rather an expression of deeper cultural determinants." p. 581

    (1) Bultmann, 'Alétheia.' The passages he cites here in support of this development (Plut. De Isid et Os. 351c, e, and Hierocles Carm. Aur. 21-23 Mullach) are far too late to represent the direct semantic development of Platonic usage of the term. The same objection holds for Bultmann's citation of Epictit. (Diss. 1.4, 31; 3.24, 40) for the extension of Alétheia into 'the sense of `correct learning.' From these observations he proceeds into his second major heading in the discussion of the Classical and Hellenistic evolution of the word, 'The Usage of Dualism.' In this section he again fails to make the crucial distinction between fourth- and third-century (and later) usage.

    (2) Bauer,Arndt, and Gingrich, Lexicon, s.v. 'Alétheia', cite Plutarch (Is. and Os. 351e) and Philo (Spec. Leg. 4.178, 'the proselyte is a *metanastàs eis aletheian*') as the non-Christian

antecedents for Alétheia denoting 'the content of Christianity as absolute truth.'

"This research aims to study the Aristotelian notion of truth (αλήθεια) in relation to the development of the so called logic of comparison from a historical and philosophical standpoint. The logic of comparison (or comparative logic) is defined as the proportioning way to make comparisons between different terms through major, minor or equal measure (Casari 1984; 1985). The main thesis of this research is that the Aristotelian notion of truth is not a gradable value, i. e. declinable by “more” or “less”, but, because of that, it could be considered as the ultimative reference of validity for comparative logic. This is argued through the analysis of three chosen key-concepts: gradationism, truth and comparison. Firstly, it is shown how some Aristotelian conceptions about “more” or “less” were unduly taken over with ontological (mis)understanding by later metaphisics, up to consider them as logical justification of existence for degrees of being and corresponding truths, despite Aristotle’s thought, from faulty sensibility to a highest level of absolute Truth. Some recent authoritative studies about the subject of the Aristotelian theory of αλήθεια are been considered here and the result is that none of those allows to attribute such a gradable notion to Aristotle. Then it is proposed a critique evaluation about the problem of the origins of the ancient comparative logic, showing that presumed degrees of truth are not detectable at all in the Aristotelian dialectic, but only more or less sound arguments always based on the criterion of bivalence (truth/false) provided by the Principle of Excluded Middle. Finally, the research ends arguing the groundlessness for attributing to Aristotle the idea

of an intuitive and pre-predicative truth as different, prior and superior to an alleged predicative truth through the contextual critique of the interpretations of A. Trendelenburg (1846), F. Brentano (1862) and M. Heidegger (1930) and their common Neo-Scholastic background. - From a theoretical point of view, the whole thesis can be read as a critique to the idea of «truer»."

"Tbe study of truth is a central part of the philosophical tradition we have inherited from classical Greece. Aristotle played an important role in developing and sharpening the debate in this area and on many issues that are connected with it. I have two primary goals: to offer a precise reconstruction of all of Aristotle's most significant views on truth and falsehood and to gain a philosophical understanding of them. In this introduction I first offer an overview of Aristotle's theory of truth and then discuss the methodology I adopt in pursuing my primary goals.

I AN OVERVIEW OF ARISTOTLE'S THEORY OF TRUTH

Why an overview? Aristotle speaks about truth and falsehood in passages from several works, mainly the *Categories* (chapters 4, 5, 10, and 12), *de Interpretatione* (chapters 1-9), *Sophistici Elenchi* (chapter 25), *de Anima* (chapter 3.6), and the *Metaphysics* (chapters Γ 7, Δ 7, Δ 29, E 4, and Θ 10). Truth and falsehood are not the main topic of these works: their discussions of truth and falsehood are asides. Reconstructing an Aristotelian theory of truth and falsehood on the basis of such asides poses complicated problems of various sorts. To help readers to keep their orientation through the many bifurcations of the arguments addressing these problems, I decided to offer a concise but precise map of the territory — an overview of Aristotle's theory of truth. References to the passages from Aristotle's works that substantiate the attribution of a certain view to him, and an examination of the

relevant secondary literature, will be found in the chapters that follow this introduction." (p. 1)

Paris: Éditions Rue d'Ulm / Presses de l'École normale supérieure.

    " Lorsque, en *Metaphysique* Δ, 29, Aristote parle de la « chose vraie », cela ne signifie pas que le Stagirite possède, outre sa conception de la vérité propositionnelle, une conception de la vérité ontologique. Dans le texte en question, Aristote adopte, pour les besoins de la polémique, la conception antisthénienne de la proposition et de la vérité, selon laquelle il ne peut y avoir qu'un *logos* par objet, ce qui entraîne l'impossibilité de la contradiction. Cette conception donne lieu à des paradoxes, auxquels Platon se heurte notamment dans le *Sophiste*; mais qui n'ont été définitivement résolus que par la distinction analytique effectuée par Aristote entre sujet et prédicat, distinction qui marque la naissance de la notion de proposition proprement dite."

History of Truth: *Veritas* in Latin Middle Ages from Augustine to Paul of Venice

Introduction

It is in the Middle Ages that for the first time were written treatises under the title of *De veritate* and the medieval definition of truth as "adequation of intellect to the thing" is well known; this page is about his history and the criticism made against it.

"The first medieval work on truth is the dialogue *De veritate* of Anselm of Canterbury (c. 1080-85). It is in many regards an original treatise. In Chapter One Anselm writes, "I do not recall ever having found a definition of truth; but if you wish, let us inquire as to what truth is by going through the various things in which we say there is truth." In the next chapters he examines not only what truth of the proposition and of thought is, but also that of the will, of action, of the senses and of things. In all these cases the analysis results in establishing truth as rightness or rectitude (*rectitudo*), denoting that something is as it ought to be, that it does that "for which it is made" (Ch. 2). Anselm's definition, then, is ultimately (Ch. 11), "rightness perceptible only to the mind" (*rectitudo mente sola perceptibilis*) - the addition is meant to exclude cases of a merely visible rectitude, e.g., that of a (straight) stick.

The definition rectitude reminds us of the rightness (*Richtigkeit*) of which Heidegger spoke. But Anselm's analysis is carried out on yet a different level. To be sure, Anselm too deals with the truth of the proposition (although as one of the areas in which truth can be found), and also for him an enunciation is true when it signifies that

that which is, is. It is here, however - in the "rightness", if one will - that truth manifests itself as rectitude, since in this way the statement fulfils the end contained in its nature. It is primarily this inner conformity which Anselm means by rightness, not the "correctness" of the proposition with respect to the outer world.

The adaequatio-formula is not mentioned by Anselm anywhere in the dialogue - another indication that, to quote De Rijk, the Middle Ages are not "typically medieval". Neither does the idea expressed in the formula play a crucial role. (...)

In the second medieval work on truth, the *Questiones disputatae De veritate* of Thomas Aquinas (1256-59), the matter is different, however In this writing the adaequatio-formula is to be found again and again. It is therefore especially owing to Thomas Aquinas that the formula has become so current.

In the first disputation he mentions a series of definitions of truth, derived from various traditions. Greek philosophy is represented by Aristotle, early Christian thought by Augustine, and pre- scholastic thought by the above-mentioned definition of Anselm, who was one of Thomas's main interlocutors in this disputation. Furthermore, Arabic philosophy is represented by Avicenna. Among the many determinations of truth is also the formula *adaequatio rei et intellectus*, ascribed by Thomas to a tenth-century Jewish philosopher, Isaac Israëli. No one, however, has been able to locate this definition in Israëli's works. Scholars suggest Avicenna and Averroës as possible sources." (pp. 5-6)

From: Jan A. Aertsen, *Medieval Reflections on Truth. Adaequatio ei et intellectus*. Amsterdam: VU Boekhandel 1984.

Veritas in ancient Latin

"*Verus* as an adjective was a very old Latin word that had several meanings. It could be used as a simple explicative or affirmative (*verum!*). Most often, in Plautus and Republican literature, it meant "true" in the sense of firm, capable of withstanding a test or trial. For example: "Farewell, ... continue conquering with true [*vera,* stalwart] courage as you have done so far" (*Casina* 87-88). In this sense the Romans seem to have related *verus* to words with similar sounds

and meanings: *assevere, persevere, severus*. Cicero's Laelius affirms that "a public meeting, though composed of very ignorant men, can, nevertheless, usually see the difference between a 'demagogue' (*popularis*), that is, a shallow, flattering citizen, and one who is *constans, verus*, and *gravis*. " (*De amicitia* 95).

Veritas seems to have begun its Latin life as the abstraction of a quality of human behavior, like *gravitas* or *simplicitas*. It appears in a few instances as early as Terence and has a meaning not far from *severitas* (rigor, sternness, austerity, integrity of judgment), as opposed to compliance or levity: "There was stern *veritas* in his face, *fides* in his words" (*Tristis veritas inest in voltu atque in verbis fides* [Andria 858]). "*Obsequium* secures friends, *veritas* only enemies" (*Obsequium amicos, veritas odium paret* [Andria 68-69]). Livy's Capitolinus declares, "I know that I could say other things that you would be happier to hear, but necessity compels me, even if my *ingenium* did not admonish me, to speak *vera pro gratis*, the *vera* rather than the *gratis*. h is not that I do not wish to please you, Quirites, but I wish, much more, for you to be safe" (Livy 3. 68.9). Cicero, the first to make frequent use of the word *veritas* to translate the abstract truth, the *aletheia* of Greek philosophers, still, on occasion, employed it with its ancient associations with selflessness, severity, and constancy. "Friendships are nurtured by veritas, alliances by fides, dose relationships by pietas" (*veritate amicitia, fide societas, pietate propinquitas colitur* [Pro Quinctio 6.26])." (p. 68, notes omitted)

From: Carlin A. Barton, *Roman Honor. The Fire in the Bones*, Berkeley: University of California Press 2001.

Veritas: Origin of the definition "Adaequatio intellectus ad rem"

"Almost everyone knows that it was Aristotle who proposed the classical (or correspondence) theory of truth for the first time. However, the fact that his writings contain different and often mutually non-equivalent statements on truth is less recognized. This is a sample of Aristotelian explanations concerning the concept of truth (...):

3) To say of what is that it is not, or of what is not that it is, is false, while to say of what is that it is, and of what is not that it is not, is true (*Metaphysics* 1011 b).

4) The fact of the being of a man carries with it the truth of the proposition that he is; and the implication is reciprocal: for if a man is, the proposition wherein we allege that he is, is true, and conversely, if the proposition wherein we allege that he is true, then he is. The true proposition, however, is no way the cause of the being of the man, but the fact of the man's being does seem somehow to be the cause of the proposition, for the truth or falsity of the proposition depends on the fact the man's being or not being (*Categories* 14 b).

5) But since that which is in the sense of being true or is not in the sense of being false, depends on combination and separation, and truth and falsity together depend on the allocation of a pair of contradictory judgements; for the true judgement affirms where the subject and predicate really are combined, and denies where they are separated, while the false judgement has the opposite of this allocation (*Metaphysics* 1027 b).

6) he who thinks the separated to be separated and the combined to be combined has the truth, while he whose thought is in a state contrary to that of the objects is in error (*Metaphysics* 1051 b).

7) It is not because we think truly that you are pale, that you *are* pale, but because you are pale we who say this have the truth (*Metaphysics* 1051 b).

8) Propositions correspond with facts (*Hermeneutics* [*De interpretatione*] 19 b).

The formulation 3) is usually taken as Aristotle's official definition of truth. Now 4) repeats the content of 3) but adds that being is in a sense more basic for truth than an assertion which is qualified as true. The two statements are not equivalent because neither does () follow from 3) nor does the reverse entailment hold. Statements 5) and 6) introduce an explicit ontological parameter, namely combination and separation; these statements seem to be equivalent (or at least "nearly" equivalent). On the other hand, there is no direct entailment from 5) (or 6)) to 3) or 4), and back.

Perhaps one might say that "a is b" is true if and only if the relation which holds between referents of a and b is mapped by the relation holding between a and b, and false if the mapping is not in case. If we decide to label mapping as "combination" and not-mapping as "separation", we obtain something very close to 5) and 6). And if we look at combination as correspondence and separation as non-correspondence, 5) and 6) become popular formulations of the classical definitions of truth.

The statement 7) seems to exemplify previous explanations, particularly 3). Finally, 8) explicitly speaks about facts and correspondence but it is only a marginal remark made by Aristotle when he considered the celebrated sea-battle problem. Hence, there are no sufficient reasons to treat (8) as a serious proposal to define the concept of truth.

If we take 3) as Aristotle's official truth-definition (and, a fortiori, as the first mature explanation of CCT; [*Classical Concept of Truth*]), than other Aristotelian formulations should be understood rather as more or less auxiliary comments than proper definitions of truth. The point is very important because no idea of correspondence is directly involved in 3). Although, as my previous remarks show, "combination" can be replaced by "correspondence" but nothing forces us to dress Aristotle's truth-theory into "correspondence talk". In fact, 3)- 7) may be explained without any reference to such ideas as correspondence, agreement, adequacy or conformity; recall that 8) is only a marginal remark. I think that the best understanding of what is going on in Aristotle's theory of truth consists in looking at 3) as something which is very closely related to 1) and 2). Then if we think of Plato's philosophy of truth as a further step in the tradition beginning with old Greeks poems and continued by the Pre-Socratics, Aristotle should also be considered in the same way. Under this assumption, 3) schematically says how to answer the question: how is it? Although Aristotle supplements 3) with considerable ontological equipment, his main intuition concerning the concept of truth seems very simple.

Various explanations by Pierre Abélard of the concept of truth offered in his *Logica Ingredientibus* lead to (see De Rijk [*Petrus Abaelardus Dialectica*, Assen 1956] p. LIV):

(9) the sentence p is equivalent with "p is true" if and only if p is the case. Clearly, (9) anticipates the semantic definition of. truth but it was not properly understood in the Middle Ages (nor later).

The most famous medieval explanation of the concept of truth comes from Thomas Aquinas. His formulation is this:

10) *Veritas est adaequatio intellectus et rei, secundum quod intellectus dicit esse quod est vel non esse quod non est* (*De Veritate* 1,2).

The passage which begins with the word *secundum*, is simply a repetition of Aristotle's main formulation (see (3) above). But the first part of 10) -- *veritas est adaequatio intellectus et rei* -- is an obvious addition to Aristotle, actually related to (5) or (6). Usually, (10) is quoted in its simplified version limited to its first part: *veritas est adaequatio intellectus et rei;* in fact, this shortened formula is the most popular wording of the classical truth-definition. However, everybody who employs this simplified record of CCT as "Aristotelian", must remember that it is certainly not Aristotelian to the letter. The question whether and to which extent it is Aristotelian in spirit requires special investigations that exceed the scope of this paper. So I restrict myself to some remarks on *adaequatio intellectus et rei*.

One can link the meaning of *adaequatio* in 10) with the second (Aristotelian) part of this formula. However, Aquinas also uses such terms as *conformitas, corresponde n tia* and *convenientia* to explain his understanding of CCT. It suggests his *adaequatio* expresses (or at least might express) a content which is not quite reducible to Aristotelian intuitions.

What is going on in the first part of 10)? There are several possible answers. Let me indicate three. Firstly, *veritas est adaequatio intellectus et rei* may be regarded as a counterpart of 5) or 6). Secondly, the fact that the *adaequatio*-formula opens Thomas' definition seems to suggest that he changed the centre of gravity in the Aristotelian truth-theory in such a way that *adaequatio, correspondentia, conformitas* or *convenientia* became crucial ideas in defining truth. Thirdly, the *adaequatio*-formula was invented by the Schoolmen to capture intuitions concerning truth in a simple

way; the Schoolmen very much liked brief formulations. It is very difficult to decide today which interpretation (I am very far from claiming that my three cases exhaust all possible interpretations of 10)) is correct with respect to Aquinas' original intentions. However, the next development of Thomism rather followed the second interpretation. For instance, Francisco Suárez says that *veritas transcendentalis significat entitatem rei, connotando cognitionem seu conceptum intellectus, cui talis entitas conformatur vel in quo talis res representatur* (*Disputationes metaphysicae,* 8, 2.9). The content of 3) is completely absent in Suárez. He proposes instead an analysis of truth with the help of the concept of *representati*o and seems to assume that a *conformitas (adaequatio, correspondentia)* holds between thoughts and their objects. That is what I mean by "changing the centre of gravity". Most post-medieval thinkers adopted this route in their thinking on truth and tried to explain how *adaequatio* should be understood.

It is now proper to introduce an important distinction (see Wolenski-Simons [1989]), namely that of weak and strong concept of correspondence. If the concept of correspondence is governed by 3) (or similar statements), we are dealing with correspondence in the weak sense. On the other hand, Suárez's approach employs correspondence in the strong sense. I am inclined to regard the distinction of the two concepts of correspondence as fairly crucial for the history of CCT. Thus, we must always ask which concept of correspondence is used in particular truth-theories because many difficulties with interpreting philosophers' views on truth are rooted in their view of the distinction in question. As far as the matter concerns the concept of correspondence, it has been explained by notions like sameness, similarity, model, picture, co-ordination, isomorphism or homomorphism (...).

Let me finish this section with some historical remarks (see Gilson [1955]). Aquinas notes that his definition of truth is derived from *Liber de definitionibus* by Izaak ben Salomon Israeli; Aquinas also refers to Avicenna in this context. However, *adaequatio* does not occur in Israeli's truth-definition which (in Latin version) is this: *Et sermo quidem dicentis: veritas est quod est, enuntiativus est nature veritatis et essentiae ejus, quonian illud sciendum quod es res, vera est; est veritas nonnisi quod est*; this formula is fairly Aristotelian.

Avicenna in his *Metaphysics* says (in Latin translation) that *veritas [...] intelligitur dispositio in re exteriore cum est ei aequalitas*; the last word suggests the strong sense of correspondence. It was William of Auvergne who introduced the term *adaequatio* in philosophy for the first time. He refers (in *De universo*) to Avicenna in the following way: *et hoc [intentio veritas] ait Avicenna, est adaequalio orationis et rerum*. Then William adds that the truth is *intellectus ad rem*. In Albertus Magnus' treatise *De bono* we find that truth is *adaequalio rei cum intellectu*. Then comes 10)." (pp. 141-144 of the reprint).

From: Jan Wolenski, "Contributions to the History of the Classical Truth-Definition", in: *Logic, Methodology and Philosophy of Science* Vol. IX. Amsterdam: Elsevier 1994 pp. 481-495, Proceedings of the Ninth International Congress of Logic, Methodology and Philosophy of Science, Uppsala, Sweden, August 7-14, 1991. (Reprinted in: Jan Wolenski, *Essays in the History of Logic and Logical Philosophy*, Cracov: Jagiellonian University Press 1999, pp. 139-149.

"In the *Summa Theologica* (I, q. 16; a. 2, ad 2) of St. Thomas Aquinas we read: "Praeterea, Isaac dicit in libro *De efinitionibus*, quod "veritas est adaequatio rei et intellectus"." Also in his De Veritate, q. 1, a. 1, we find the statement: " Et sic dicit Isaac, quod veritas est adaequatio rei et intellectus ".

B. Geyer in his work, *Die Patristische and Scholastische Philosophie* (Berlin, 1928), p. 334, says " Bonaventura, Heinrich von Gent, Thomas von Aquin entnehmen die bekannte scholastische Wahrheitsdefinition: veritas est adaequatio rei et intellectus dem "Buch der Definitionen Isaaks. " He gives a reference to St. Bonaventure's commentary on First Book of Sentences (d. 40, a. 2, q. 1) where the definition is found. It is not there attributed to Isaac by St. Bonaventure and the footnote referred to below. is repeated distinctly saying it does not occur in Isaac.

In the work S. Thomas d'Aquin by A.-D. Sertillanges (Paris, 1910) Tome I, p. 41, we read: "Quant à celle d'Isaac, que saint Thomas semble affectionner par-dessus les autres: "La vérité est l'adéquation des choses et de l'intelligence" (adaequatio rei et intellectus), c'est une définition à double entente." J. de Tonquédec, in his *La Critique*

de la Connaissance (Paris, 1929, p. 512) says: " Le vrai, dit Isaac, est l'équation de la chose et de l'esprit ", and in a footnote it is stated: "La définition de la vérité se trouve dans le *Livre des Définitions*, comme le dit saint Thomas."

In the *Encyclopedia Britannica* (ed. IV, 1929, it is not in the 1910 edition) s. v. *Israeli, Isaac Ben Salomon* we read: " Through the labours of Gundissalinus he became very popular with the thirteenth century scholastics who took from his definitions the famous definition: veritas est adaequatio rei et intellectus. (1)" (p. 5)

(...)

Several other references might be given to modern writers on mediaeval philosophy who attribute the definition to Isaac.

Among mediaeval writers, St. Albertus Magnus attributes the following definition of truth to Aristotle: " Dicit enim Aristoteles in V primae philosophiae, quod "veritas est adaequatio rerum et intellectuum" " (*Summa Theologica*, P. II, Tr. 1; q. 1; m. 2; a. 1, Arg. 4.). Moreover he gives Isaac's definition of truth as follows: " Complexi autem sermonis veritas est secundum Isaac in libro de Definitionibus, affirmatio rei de qua vere praedicatur, vel negatio rei de qua vere negatur. " (I. Sum. Theol., Tr. VI, q. 25, m. 1). " Et hoc modo veritas, ut dicit Isaac in libro de definitionibus, quod veritas non est nisi quod est et quod res vere est. " (I. Sum. Theol., T. 6, q. 25, m. 1). " Dicit enim Isaac quod "veritas est id quod est res", vel secundum aliquos, "veritas est sermo quem confirmat demonstratio". " (I. Sum. Theol., T. 6; q. 25, m: 2.). " Secundum Isaac et secundum Augustinum, verum est id quod est. " (Ibid. No. 3.). " Et secu idum hoc dicit Isaac, quod "veritas est sermo quem aff rmat demonstratio vel sensibiliter vel actualiter. " 1. Sum Theol., T. 6, q. 25, m. 1.

St. Bonaventure quotes the definition "adaequatio rei et intellectus" several times, (v. g. Sent., Lib. I, D. 40; Art. 2; q. 1. Sent., Lib. I, D. 46; Art. 1; q. 4. Sent., Lib. II, D. 37; Art. 2; q. 3. In Hex. Collationes, III. par. 8), but so far as I have discovered, he does not state where it is to be found.

In the Quaracchi Edition of his works (1882), Tom. I. p. 707, note 5, the editors call attention to the fact that they had read one ms. of

Isaac (Monac. B. R. 8001, ff. 151v.-154r.) without finding the definition of truth which St. Thomas attributes to him. They quote from Isaac a definition which will be referred to later on. In several other places where St. Bonaventure quotes the definition veritas est sermo quem confirmat demonstratio, they refer the reader to this note or repeat it in full." (pp. 6-7)

(...)

I have just finished reading three mss. of Isaac *De definitionibus*, viz. (a) Paris B. N. 6443, ff. 187r-190r; (b) Paris B. N. 14700, ff. 153r-160v. Catalogued as belonging to the XIII. century, it bears the book-mark of the Abbey of St. Victor in Paris. (...) In none of these mss. did I find the definition of truth so persistently attributed to Isaac.

On f. 156v, 14700, there begins a long list of definitions which continue to the end of the work. This list is also in 6443, but the Vatican ms. lacks it. In these mss. Isaac gives the following definitions of truth: 1. "Diffinitio namque veritatis est quod est ; et diffinitio vani tatis est quod non est aliquid aut, narratio rei absque eo quod est." 14700, f. 155r. C. 1, 11. 12-13; 6443, f. 147v. C. 2, 11. 45. The Vatican ms. reads the same except that it has autem for namque, and falsitatis for vanitatis. (F. 47v. C. 2, 11. 25 sq.)2. Diffinitio veritatis; and there is written in the margin, by the same hand I think, veritas est quod est res. And then the text goes on: " et diffinierunt eam disertores. Dixerunt enim, veritas est sermo quem firmat demonstratio aut sensibiliter aut intellectualiter. ... hec diffinitio est assumpta ex qualitate veritatis, non ex eius quiditate. Et illud ideo, quoniam cum aliquis dicit quid est veritas, est responsio in eo est quod est res, et cum dicit qualis est, dicitur ei quod est sermo quem demonstratio firmat aut intellectualiter aut sensibiliter... et sermo quidem dicentis veritas est quod est enuntiativus est nature veritatis et essentie eius, quoniam illud secundum quod est res, vere est veritas, non nisi quod est. ... falsitas est non quod est res, et dicitur falsitas, narratio rei cum diverso quod est ipsa et ipsius . contrario. " (14700, 158v, C. 2, 11. 30 sq.) Ms. 6443 is a very poor text. The above passage is faulty but the important parts relative to this question are the same. In the margin of 189r. C. 2, 1. 21 there is written in the first hand: " diffinitio veritatis; veritas est quod res est, " and in the same column 1. 39, we read: " sermo quidem dicentis:

veritas est quod est essentiativum (sic) est nature veritatis et essencie eius quoniam illud secundum quod est res vera est; est veritas non nisi quod est. "3. " Verum est affirmare rem rei cui est secundum veritatem aut expellere rem a re a qua vere removetur. ... Falsum est affirmare rem rei que ab ea removetur vere et removere rem a re que ei affirmatur secundum veritatem. " (14700, 159 r. C. 1, 11. 22 sq. = 6443, 189r C. 2, 11. 48 sq.) Monacensis 3001 as quoted in the Quaracchi Edition varies somewhat in wording from the above, but the meaning is much the same.

The definition of verum (number 3) perhaps comes nearest to the definition ascribed to Isaac by St. Thomas, yet it is by no means the same either in meaning or language. Perhaps some reader may know of a different manuscript tradition of Isaac wherein the classic definition is found." (pp. 7-8)

Notes

(1) The statement in the *Encyclopedia Britannica* might lead one to believe that Gundissalinus quoted the definition from Isaac. I have also read recently a ms. of Gundissalinus *De anima*, Vat. Lat. 2186, f. 104r.-119v. I found there this definition of truth; veritas autem cuiusque rei est id quod ipsa est. f. 118 v., 1. 30

Selected Bibliography on the Theories of Truth in Latin Middle Ages

Bibliography

1. Aertsen, Jan A. 1984. *Medieval Reflections on Truth. Adaequatio rei et intellectus*. Amsterdam: VU Boekhandel.

   Inaugural address on the occasion of his taking up the chair of Medieval philosophy of the Free University in Amsterdam on November 9, 1984.

   "There are certain basic words which form the undertone of our thinking and of the manner in which we experience things. These basic words are not unchangeable; they often receive a different content . . . One such basic word is 'truth'."

   This is the start of the report of the Synod of the Reformed Churches in the Netherlands, issued in 1981, "On the nature of the authority of Scripture".(1) How does it happen that the Bible is read so differently? In searching for an answer to this problem, the report adopts a course remarkable within the. Reformed tradition. It poses a truly philosophical question: "What is truth?" That the Bible is read differently is related to the fact that not all people mean the same by what they call "truth".

   If I want to raise this same question today, then I am in good company - though I must add at once that it is the matter rather than the company that motivates me. From the outset, that is, as early as with the Greeks, philosophy and truth are seen in an

intimate connection. Aristotle, for example, describes philosophy as the "theory" of truth.(2) It is in the Middle Ages, however, that for the first time treatises appear under the title of *De veritate,* where truth itself is explicitly made the object of reflection. I would like to draw your attention to medieval observations on the query about truth.

'Adaequatio rei et intellectus' as the medieval formula of truth and the criticism of it.

Is an exposition on this theme worthwhile, though? Do we not already know what truth was in the Middle Ages? Probably there is no formulation in scholastic thought that has become more widely known. Even those who did not enjoy the privilege of a classical education are able to say that truth is *adaequatio rei et intellectus*. What is meant by that seems to be clear. The formula appears to express the "natural" idea of truth, i.e., the correspondence between thought and reality. The determination of truth as *adaequatio* has become so self-evident that, as the *Handbuch philosophischer Grundbegriffe* states, it is the point of depart and reference for all contemporary discussions on truth.(3) It can be added that this occurs mostly in a critical sense. Two examples may suffice.

In the above-mentioned synodal report the first chapter sketches the changes in the concept of truth over the course of time. The so-called subject/object relation underlies the entire exposition, apparently from the unquestioning presupposition that this relation is fundamental to the phenomenon of truth as such. The changes in the concept of truth, then, are described in three phases. Successively the report speaks of "objective truth", "subjective truth" (in systems of thought like idealism and existentialism), and finally, of a newer conception called the "relational" concept of truth - the objective and the subjective in one. This means that "truth always occurs within a relation, within the 'relatedness' of man to something else."(4) As the report claims, moreover, this relational concept of truth links up with what the Bible calls truth.

The objective concept of truth - the most current idea of truth - is represented by the medieval formula, phrased "truth is the

correspondence of the human way of picturing things with the matters themselves." The human way of imagining things, the human consciousness, is like a mirror able to reflect "the objective state of affairs". This conception of truth is not only ascribed to Thomas Aquinas, but to a great variety of people: " . . . Greek philosophers, . . . the classical Reformed theologians, . . . the logician Bertrand Russell, . . . the Marxist Lenin". The drawback of this conception, in the assessment of the report, is that man is very passive. Does knowing the truth not demand man's activity, research; and wrestling? Without a human spirit there is no truth.

An entirely different criticism can be found in Heidegger, who dealt most thoroughly with the western conception of truth. The lectures he delivered at the University of Freiburg during the winter semester of 1942-43 appeared in 1982 in the *Gesamtausgabe* of his works under the title *Parmenides*.(5) Strictly speaking, the title is misleading for actually these lectures deal with the essence of truth, the identical subject that engaged Heidegger in writing *Vom Wesen der Wahrheit,* which dates from the same time. In the lectures, however, there is "a more direct confrontation with the history of western thought". (6) In his view a change in the essence and "locus" of truth has evolved in philosophy. Truth becomes "rightness" *(Richtigkeit)* of knowing and asserting; it is no longer "unconcealedness" *(aletheia)* of being, as it was for the early Greek thinkers. The medieval formulation fixes this essential transformation. " *`Veritas est adaequatio intellectus ad rem' Im Sinne dieser Umgrenzung des Wesens der Wahrheit als Richtigkeit denkt das gesamte abendländische Denken von Platon bis zu Nietzsche.* "(7) Truth becomes a characteristic of a mental act within man. Inevitably the problem then arises how a psychical process in the inner man can be brought into agreement with things outside.(8) This traditional and current conception of truth, however, is derivative *(abkünftig).* Parmenides' thought reveals "the road of truth, far away from the beaten track of men". *(Fragm.* B 1, 27). It can give us a reminder of the forgotten "primordial" sense of truth, the unhiddenness of being, which is the ground of the possibility of rightness.

But when the proper function of philosophy is to "re-mind", we are also allowed to ask of this twofold criticism: do we recall the meaning of truth as *adaequatio rei et intellectus* at all? Does it have a merely derivative sense, i.e., the rightness of thought? On the other hand, does the formula imply that truth is "reflection" and leave the human mind out of account? These questions lead, me this afternoon to focus on medieval views of truth, in which the idea of the *adaequatio* plays a central role." (pp. 3-5)

Concluding observations.

Looking back over the course of this discussion, we may conclude that the criticism of the medieval *adaequatio*-formula, outlined at the beginning, did not grasp its original meaning. Neither is this conception concerned with truth in a merely derivative sense, nor does it ignore man's activity. For in the previous analysis we observed that Thomas's notion of true includes first, transcendentality, second, relationality, third, anthropocentrism, fourth, the fulfilment in an act of the intellect, fifth, the necessity of a norm and measure, sixth the intrinsic connection with the word, seventh, the relation to the divine Logos, and finally, the identity with God Himself. These moments are implicitly or explicitly expressed in the formula *adaequatio rei et intellectus*, in which every term is charged with meaning.

Compared to the breadth of this conception, modern theories appear to be a reduction of the integral process of truth. It is philosophically important to note that in the medieval approach what is fundamental to truth is not the duality of subjective and objective from which then their togetherness has to be conceived. Rather, it is the primordial conformity of being and intellect that is fundamental to truth. Indeed, as we have seen, being and thinking are the same in the Origin.

Another remarkable aspect in this medieval view is the attempt to integrate philosophical and religious truth. This endeavour runs parallel to the philosophical introduction of the synodal report of the Reformed Churches, with which I began this address. Its intention is that the "relational" concept of truth

links up with what the Bible calls truth. Thomas's conception lies concretely in the notion of word, a good example of the way in which his understanding of truth is deepened by a theological reflection. But that which fundamentally enables the integration is the basic idea of the transcendentality of truth. This conception underlies his entire discussion.

The medieval doctrine of the transcendentals - being, one, true, good, and beautiful - forms "the heart of scholastic ontology and metaphysics."(93) This doctrine will be the subject of my research over the coming years. Today I wanted to present you with a sample of it.(94)

History of Truth. Selected Bibliography on Medieval Primary Authors

The Authors to which I will devote an entire page are marked with an asterisk (*).

- Hilary of Poitiers
- Augustine of Hippo (*)
- Boethius (*)
- Isidore of Seville
- John Scottus Eriugena (*)
- Isaac Israeli
- Avicenna (*)
- Anselm of Canterbury (*)
- Peter Abelard (*)
- Philip the Chancellor
- Robert Grosseteste
- William of Auvergne
- Albert the Great
- Bonaventure
- Thomas Aquinas (*)

- Henry of Ghent
- Siger of Brabant
- John Duns Scotus (*)
- Hervaeus Natalis
- Giles of Rome
- Durandus of St. Pourain
- Peter Auriol
- Walter Burley
- William of Ockham (*)
- Robert Holkot
- John Buridan (*)
- Gregory of Rimini
- William of Heytesbury
- Peter of Mantua
- Paul of Venice

Hilary of Poitiers (ca. 300 - 368)

3. Rijk, Lambertus Marie de. 1981. "Boèce Logicien Et Philosophe: Ses Positions Sémantiques Et Sa Métaphysique De L'être." In *Atti Del Congresso Internazionale Di Studi Boeziani (Pavia, 5-8 Ottobre 1980)*, edited by Obertello, Luca, 141-156. Genova: Accademia Ligure di scienze e lettere.

   "Le grand historien Etienne Gilson a bien remarqué que c'est à propos du problème du Bien que la pensée de Boèce fut la plus personnelle et la plus féconde. Avec Platon et Saint Augustin, il identifie dans son opuscule *Quomodo substantiae* l'être au Bien (comme le Mal au non-être). Il est évident que dans l'opinion de Boèce la doctrine de l'être obtient une importance décisive comme base de la théorie du Bien. Aussi la solution du problème du Bien et du Mal fut esquissé dans sa métaphysique de l'être.

L'identification de l'être et du Bien implique que pour tout ce qui est, c'est une seule et même chose *d'être* et *d'être bon*. Mais si les choses sont *substantiellement* bonnes, en quoi diffèrent-elles du Bien en soi, qui est Dieu? Dans cette question la problématique du *Sophiste* de Platon a dû revivre. On sait que dans cette dialogue Platon a essayé de resoudre le problème fondamental de l'être des choses périssables par une analyse vraiment pénétrante des notions de «Même» (*tauton*)et «Autre» (*heteron*).

Il me semble que Boèce fait une chose comparable. Il n'est pas étonnant qu'il commence (dans *De hebdomadibus* = *Quomodo substantiae* etc.; voir l'edition de Stewart-Rand) ses exposés approfondis sur la notion de l'être par l'axiome qui a dû provoquer tant de commentaires pendant le moyen âge: *diversum est esse et quit quod est* (II 28-30: «il ya diversité entr "être" et "ce qui est"»). Cette formule, qui est valable pour tout être composé concerne la différence ontologique entre l'élément constitutif, ou la forme, de tout être composé d'un côté, et la chose elle-même, ou le tout établi par cette forme, de l'autre. Le tout doit son être à l'élément constitutif qui est la forme substantielle, sans laquelle il n'est pas du tout. Cependant la question sur son essence ne peut pas être resolue en désignant cette forme. (...)

Il semble être utile de prendre au sérieux la suggestion des commentateurs médiévaux et d'entreprendre la réponse à notre question du point de vue sémantique. Je propose de discuter d'abord (1) la notion de *qualitas* chez Boèce (2), ensuite son modèle sémantique (3), et ses idées sur le rôle (logico-sémantique) du nom et du verbe (4-5); enfin la signification exacte de sa notion de l'être (*esse*) sera discutée (6) et éclarcie en mettant en lumière le but et la méthode du traité *Quomodo substantiae* (7)." pp. 141-142 (Notes omitted).

   "I explain how Abailard thinks he can justify saying that certain items, particularly what is said by a sentence, are not things. His grounds are that they are never referred to by any noun. He holds that nominalizations of sentences and of verbs, which appear to be nouns with such a reference, are not logically speaking nouns, and sentences which have a nominalization for a grammatical subject do not have any logical subject."
3. ———. 1976. *Abailard on Universals*. Amsterdam: North-Holland.

   "This work shows how Abailard elaborated and defended the view that universals are words, avoided the pitfalls of an image theory of thinking, and propounded a theory of "status" and "dicta" as objects of thought without treating them as subjects of predication. His defense of these views is shown to depend on certain fundamental departures from the Aristotelian term logic of his day, including a proposal for subjectless propositions, the treatment of copula plus predicate noun as equivalent to a simple verb, and a transformation of the 'is' of existence into the 'is' of predication."

   "Aquinas presents his most complete exposition of the transcendentals in De veritate 1, 1, that deals with the question "What is truth?". The thesis of this paper is that the question of truth is essential for the understanding of his doctrine of the transcendentals.

   The first part of the paper (sections 1--4) analyzes Thomas's conception of truth. Two approaches to truth can be found in his work. The first approach, based on Aristotle's claim that "truth is not in things but in the mind", leads to the idea that the proper place of truth is in the intellect. The second approach is ontological: Thomas also acknowledges that there is truth in every being. The famous definition of truth as "adequation of thing and intellect" enables him to integrate the two approaches. Truth is a relation between two terms, both of which can be called "true" because both are essential for the conformity between thing and intellect.

   The second part of the paper (sections 5--7) deals with the manner in which Thomas gives truth a place in the doctrine of the transcendentals, and shows that his conception of truth leads to important innovations in this doctrine: the introduction of relational transcendentals and the correlation between spirit and being. If "truth" is transcendental, it must be convertible with "being". Sect. 6 discusses objections that Thomas advances himself to this convertibility.

   Sect. 7 deals with a difficulty in his account of truth as a relational transcendental. Ontological truth expresses a relation to an intellect but the relation to the human intellect is accidental for the truth of things. Essential for their truth can only be a practical intellect that causes things. In this way, Thomas argues, the divine intellect relates to all things."

Texts

1. Hervaeus, Natalis. 2008. *A Treatise of Master Hervaeus Natalis (D.1323) the Doctor Perspicacissimus on Second Intentions*. Milwaukee: Marquette University Press.

   Volume One - An English translation and Volume Two - A Latin edition by John P. Doyle.

   "These volumes present a first critical Latin edition and an English translation of an important, but very difficult to read and understand, medieval treatise. As almost everyone knows, the notion of intentionality comes from the Middle Ages. What is less known is that Hervaeus Natalis, O.P. (d. 1323) was the first one explicitly to consider it as such. Even less known is the fact that he carne to it not immediately from the Aristotelian *De Anima,* but rather from the division in Aristotle's *Metaphysics* between "being as being" and "being as true." Least of all known is the fact that Hervaeus, who uses the term"intentionality" in the present work 235 times, regards its significance as a relation of reason which runs in the direction of known or knowable to knower. Apart from its exceedingly obscure Latin style, what particularly makes this work difficult to understand is its multi-layered reflection on things and non-things, its reflection on Hervaeus thinking itself, and its reflection on his thinking about things and non-things."

   "In this paper, Ockham's theory of an ideal language of thought is used to illuminate problems of interpretation of his theory of truth. The twentieth century idea of logical form is used for finding out what kinds of atomic sentences there are in Ockham's mental language. It turns out that not only the theory of modes of supposition, but also the theory of supposition in general is insufficient as a full theory of truth. Rather, the theory of supposition is a theory of reference, which can help in the determination of truth values within the scope of simple

predications. Outside this area, there are interesting types of sentences, whose truth does not depend on whether the terms supposit for the same things or not for the same things."

Martin Heidegger on *Aletheia* (Truth) as Unconcealment

Introduction

"We come now to a decisive point in Heidegger's development. The effort to ground metaphysics (fundamental ontology) began as a search to illuminate the intrinsic correlation between the Being-process as such and the finitude of the being that comprehends it, sc. There-being. The first step (*Sein und Zeit*) was to analyse There-being phenomenologically in order to find in the pre-ontic comprehension of Being some means of discerning the sense of Being. Subsequently the author has become more and more preoccupied with Being itself, but chiefly in terms of the problem of truth, since the sense of Being is its truth. The growing importance of the problematic of truth is discernible in all of the works that followed *SZ* and culminates now in the essay "On the Essence of Truth," where Heidegger thematizes the problem, retaining as intrinsic to it the problem of finitude, sc. the negativity of truth which he calls "un-truth."

Although published late (1943), the text dates initially from 1930. The author admits to several subsequent revisions, which, however, left the point of departure, fundamental position and basic structure of the original work unchanged. Taking him at his word, we assume that the text represents his thought as of 1930, and, although the matter would be very illuminating, must leave to historians the task of disengaging what alterations were made when.

We are relatively well prepared for the study we are about to undertake and do not approach it in a vacuum. We know: that the

truth of conformity (between judgement and judged) supposes a still more fundamental truth that resides in the being to-be-judged and enables us to discern whether or not the judgement is conformed to it; that this truth of the being-to-be judged is basically an un-hidden-ness, or open-ness, of that being to the knower; that beings become un-hidden to a finite knower because this knower has a comprehension of their Being- structure antecedent to his encounter with them; that this antecedent comprehension may be conceived as an open horizon, or domain of encounter, or the World (or, for that matter, Non- being), within which beings and There-being meet; that this sphere of open-ness is instituted by the transcendence of the finite There-being; that the transcendence of finite There-being is ontological truth, which, since it renders possible the encounter that occurs in There-being's comportment with other beings, enables the beings-to-be-judged to become manifest (ontic truth); that this transcendence liberates the beings which it encounters from the obscurity that initially enshrouds them by letting them be (manifest), hence must be called freedom; that this transcendence (freedom) is the primary sense of truth; that this transcendence is profoundly finite, therefore negatived, so that truth comports non-truth; that one consequence of the negativity of There-being as transcendence (freedom, truth) is that it is prone to become absorbed in its preoccupation with the beings that measure the truth of its judgements, and forget its true self; that it re-collects its self in re-solve, which thus becomes the eminent mode of truth." (pp. 211-212, notes omitted)

From: William J. Richardson, *Heidegger. Through Phenomenology to Thought*, The Hague: Martinus Nijhoff 1974.

Heidegger's reading of Plato

"For Heidegger, the de-volution of Western thought began with Plato, for it was with him that νοεῖν ceased to have the sense of containing the advance of over-powering φύσις and began to assume the special relation to ἰδέα, which evolved into what the tradition would call "reason" (*Vernunft*). We discern the transition best, however, by examining not Plato's use of νοεῖν but rather the implications of ἰδέα, for it was thus that he understood the Being which his predecessors had understood as φύσις. It was Plato's

conception of Being rather than of thought which was decisive in the birth of metaphysics. If we recall that φύσις (emergent-abiding-Power) was for the pre-Socratics the process of truth, then the transformation of φύσιςinto ἰδέα may be discerned by examining what Plato understood by truth. This the author disengages by an essay upon the famous metaphor of the cave *(Politeia* VII, 514 a, 2 to 517 a, 7)." (p. 301)

(...)

In Plato metaphysics in the traditional sense takes its rise, for it is he who first conceives of thinking Being as a going "beyond" the beings of experience to their being-ness, which he conceives as their what-ness, their see-ableness, their Idea. Such a conception is possible only because a consequence of φύσις (process of shining-forth) is taken to be the essence of it. Hence φύσις itself becomes for him that-which-is-to-be-seen, a being (εἶδος). Being thus becomes conceived as a being. Likewise truth, no longer non-concealment, becomes correctness of view, conformity with the Ideas." (p. 308)

From: William J. Richardson, *Heidegger. Through Phenomenology to Thought*, The Hague: Martinus Nijhoff 1974.

"*Plato's Doctrine of Truth*.(34) This text was composed, according to Heidegger's notes, in 1940 and first published in 1942. (*) Heidegger indicates in a note that the origin of this text is the 1931-32 lecture course on "The Essence of Truth," which contains a long interpretation, first, of the cave analogy in the *Republic*, then of a portion of the *Theaetetus*, principally the discussion of *Theaetetus*'s second (though Heidegger calls it the "first") answer to the question of what is episteme, "knowledge is perception." The relationship between the published text, "Plato's Doctrine of Truth," and the lecture course is curious and deserves some initial comment. First, the lecture course contains the most careful, nuanced development of which I am aware of Heidegger's now well-known understanding of *aletheia* as "unhiddenness." Within its pages are careful, often rich reflections on certain implications both of the cave analogy and of the section of the *Theaetetus* that he treats." (p. 53)

(...)

Heidegger announces on the first page his guiding thesis: the "unsaid doctrine" that he will elicit in the cave analogy is "a change in what determines the essence of truth" (p. 155). That change, we discover, is from the more originary notion of truth as aletheia, "unhiddenness," to truth as "correctness of vision," a change which, as Heidegger tells us toward the end of the essay, puts us on the fateful path toward modern subjectivism. Let us trace the crucial steps of this change, as Heidegger develops it.

Heidegger's first point is to show, very convincingly, that aletheia in its originary sense of unhiddenness is still very much at work in the cave analogy. He notes that the deeply visual character of the analogy, the notion of moving from shadows to seeing the fire to moving outside the cave to see the things that are "more unhidden," makes sense only within a framework of truth as unhiddenness. As he puts it, "Only the essence of truth understood in the original Greek sense of aletheia--the unhiddenness that is related to the hidden (to something dissembled and disguised)--has an essential relation to this image of an underground cave. Wherever truth has another essence, wherever it is not unhiddenness or at least is not co-determined by unhiddenness, there an 'allegory of the cave' has no basis as an illustration" (p. 172). So truth as unhiddenness is still present in the cave analogy.

But no longer purely. Heidegger now announces that truth as unhiddenness is already infected, as it were, by another, different and more problematic conception of truth that is also at work here. "And yet, even though aletheia is properly experienced in the 'allegory of the cave' and is mentioned in it at important points, nonetheless in place of unhiddenness another essence of truth pushes to the fore. However, this also implies that unhiddenness still maintains a certain priority" (p. 172). This fateful other essence of truth is truth as "correctness of vision"." (pp. 57-58)

Notes

(34) Heidegger adds in a reference note that the “train of thought goes back to the Freiburg lecture course of winter semester 1930–31, “On the Essence of Truth.” It later was published as part of the collection, *Wegmerken* (Frankfurt am Main: Vittorio Klostermann, 1967). Available in English as *Pathmarks*, Cambridge: Cambridge

University Press, 1998. The essay is pp. 155–182, the “reference” note on p. 380. The essay is translated by Thomas Sheehan, whose translation I shall usually follow.

From: Drew A. Hyland, *Questioning Platonism. Continental Interpretations of Plato*, Albany: State University of New York Press, 2004.

"Heidegger's analysis of Plato attempts to show that a transformation occurs in the nature of truth in Plato's philosophy, as a consequence of which Being is subordinated to the correct perception of beings. This subordination, Heidegger maintains, characterizes the history of Western n philosophy as metaphysics.

Platons Lehre von der Wahrheit(31) is an interpretation of Plato's *Republic*, 514A - 517A; an interpretation of the allegory of the cave. It is a reflection upon the relationship between education (*paideia*), truth (*alétheia*) and the good (*agathon*), with the transformation of *alétheia* as the principal concern.

The allegory of the cave is, for Heidegger, an illustration of the nature and process of *paideia*. At each level of ascent -- within the cave to the light, and out of the cave to the sun -- the individual experiences a painful blinding. Each stage requires an adjustment and transformation in vision. This transformation in vision expresses the turning of the soul from what is disclosed in one region to what is disclosed within another. This is *paideia*, according to Heidegger. The relationship of *paideia*, in this new sense, to *alétheia* is not apparent because, as Heidegger sees it, we have not only misunderstood the nature of education but, more importantly, have misconceived the nature of *alétheia* by conceiving it as "truth." If *paideia* is a transition from one abode to another, affected by the soul's receptivity to what is disclosed within each region, then *alétheia* is disclosure itself: "At first truth meant what was wrested from a concealment. Truth, then, is just such a perpetual wresting-away in this manner of uncovering." (*ibid.* p. 32)

Unlike the case of the two distinct senses in which Heidegger employs the term "metaphysics," the two senses in which he employs the term "truth" are made very explicit. Truth, conceived as *alétheia*, is the plenary mode; truth conceived as a correspondence between an

idea and the thing it represents is a derivative mode. Because Heidegger invariably assigns the correspondence concept of truth to "metaphysics," understood in the restricted sense in which it designates the history of Western philosophy, we have called it the "epistemological" concept of truth. "Ontological" truth, on the other hand, designates disclosure itself -- specifically, Heidegger's attempted disclosure of Being.

Heidegger's earliest systematic analysis of the epistemological concept of truth, as well as rejection of it, occurs in *Being and Time*.

Three theses characterize the way in which the essence of truth has 'been traditionally conceived and the way it is supposed to have been first defined: (1) that the "locus" of truth is assertion (judgment); (2) that the essence of truth lies in the "agreement" of the judgment with its object; (3) that Aristotle, the father of logic, not only assigned truth to the judgment as its primordial locus, but has set going the definition of "truth" as "agreement." *(Sein und Zeit*, 7 Aufl., Tübingen, 1953, p. 214).

In keeping with the original emphasis in *Being and Time*, Heidegger asserts the presence of this conception of truth in Aristotle, Aquinas and Kant, (rather than Plato and Nietzsche), before continuing with his explicit analysis of the "epistemological" concept of truth. In the course of his analysis several important points are raised. The problem underlying what we have called the "epistemological" concept of truth, Heidegger points out, is the nature of the agreement -- *adequatio, correspondentia, convenientia* -- between a judgment and its object: "Every agreement, and therefore 'truth' as well, is a relation. But not every relation is an agreement." (p. 215) Heidegger goes on to raise and answer in the negative the question whether the "agreement" can be conceived as a relation of equality. But "If it is impossible for *intellectus* and *res* to be equal because they are not of the same species, are they then perhaps similar?"(p. 216) With reference to similarity as a possible basis for the relation called "agreement," Heidegger points out that within the judgment itself we must distinguish between the psychical process and the ideal content of judgment. Any "similarity" relation of a judgment to its object (truth) must refer to the ideal content, rather than the psychical processes of judgment. But such a distinction merely raises

an additional problem: "*How is the relation between ideal being and real being to be grasped ontologically?*" (*ibid*.)

To this question, Heidegger maintains, the philosophic tradition has no meaningful answer: "Is it accidental that no headway has been made with this problem in over two thousand years?" (pp. 216-217) In fact, Heidegger goes even further in the sentence which immediately follows the preceding one, by suggesting that this entire procedure -- trying to discern the nature of the *adequatio* which characterizes a truth relationship between *rei et intellectus* -- may be fruitless: "Does the perversion of the problem already lie in the approach, in the ontologically unclarified separation of Real and Ideal?" 38 It is of some importance to emphasize that Heidegger not only discussed and rejected the "epistemological" concept of truth, as early as Being and Time (1927), but that he regarded it the sustaining one to be found in Western ontology. And, of course he suggested an alternative as well. The alternative, which I have called "ontological" truth, remains in its essential features the basis for his later critique of Plato and the history of metaphysics.

Heidegger indicates that what "truth" means is not so much a correspondence as it is a disclosure.

(...)

It may be instructive to remember once again that the duality of truth, epistemological and ontological, occupied Heidegger's thought almost from the period immediately after the publication of Being and Time, 1927, until 1947: "The publication [on Nietzsche] when reflected upon as a whole, ought to offer an insight into the path of thought which I have travelled from 1930 to the Letter on Humanism (1947). For the two small lectures, Plato's Theory of Truth (1942) and On the Essence of Truth (1943), which were published during the aforesaid period, were already conceived during the years 1930--'31." 42 Heidegger's early concern with "truth" apparently led to a step backward in the history of metaphysics, from Aristotle to Plato, in locating the "decisive" stages in man's forgetfulness of Being, through the transformation of ontological into epistemological truth." (pp. 69-73 som notes omitted)

Notes

(31) A. Francke, Bern, 1947.

From: Bern Magnus, *Heidegger's Metahistory of Philosophy: Amor fati, Being and Truth*, The Hague: Martinus Nijhoff 1970.

Heidegger on truth

"Heidegger's way of understanding the originary phenomenon of truth is to "make clear the mode of being of the cognition itself." His starting point is a proposition that is not based on intuition. Someone says with his or her back to the wall: this picture hangs askew. The proposition embodies the claim to have discovered the picture (as a being) in the "how" (the mode) of its being. The proposition displays this "how" of being in language. In the attempt to verify the proposition by sensuous experience, the recognition, according to Heidegger, is directed only to the intended being (the picture) and not to the proposition. It is directed to the being itself (which is to be verified by perception) in its mode of uncoveredness (*Entdeckt-heir*), i.e., in its showing-itself. Confirmation (*Bewährung*) means this showing-itself of the being in the same way in which it is intended in the proposition.

A true proposition shows the being in its mode of uncoveredness. The phenomenon of "originary truth" does not have the character of correspondence. It is the ground of the concept of truth in the sense of correspondence and propositional truth. By unfolding the meaning of *alétheia* Heidegger shows us a more originary sense of truth as unconcealment (Unverborgenheit). He wants to show that this concept coincides with the first and originary concept of truth in Greek thinking. In this primary sense only the discovering human Dasein can be "true" while it is Being-discovering (*Entdeckend-Sein*). On the other hand, beings (*Seiendes*) that we can find in the world can only "be" in a secondary mode, i.e., as being-discovered *(Entdecktsein*). They can only make a claim to uncoveredness. Their fundament is the Being-discovering of the human Dasein. The being-true of a discovered being is only possible as being discovered by human Dasein as being-in-the-world.

The authentic Being of Dasein, the being-in-the truth, presupposes disclosedness (*Erschlossenheit*) of the world in states-of-mind (*Befindlichkeiten*), understanding, and discourse, i.e., the

constitution of the being *(Seinsverfassung*) of human Dasein as thrownness (*Geworfenheit*) and project (*Entwurf*). The mode of being of Dasein is characterized equiprimordially (*gleichursprünglich*) by the possibility of both authenticity (being-in-the-truth) and the deficient mode (Verfallsform) of inauthenticity. In the mode of the "they" (das Man), of obstruction (*Verstelltheit*), of gossip (*Gerede*), Dasein is in untruth. Thus the being-in-the-world of human Dasein is determined at the same time by truth and untruth. We must always fight anew for the truth of Dasein (Being-discovering). Following Heidegger, the negative expression "a-létheia" expresses the fact that hiding itself is a main characteristic of Being. In the hiding-itself of Being, human Dasein is hidden for itself in the mode of untruth.

Heidegger wants to make evident how the transition from the originary concept of truth as *alétheia* to "correspondence" came about. He wants to make clear that correspondence is only a derived form of truth: in a proposition Being should be displayed in the mode of its uncoveredness. In the inauthentic forms of mere reproducing and hearsay, the proposition becomes itself something ready-to-hand (*Zuhandenes*). Thus we have to engage in the demonstration of the uncoveredness that is preserved in the proposition. In this way the relation between proposition and discovered being then itself becomes something present-at-hand (*Vorhandenes*) and can be understood as a correspondence of proposition and being (*intellectus and res*). The fact that we are used to disregarding the originary dimension of truth is an aspect of our forgetfulness of Being (*Seinsvergessenheit*).

The originary dimension of truth in human Dasein "is given" (*gibt es*) only as long as there is Dasein. All truth is relative to the being of Dasein. Thus the claim that there could be "eternal truth" seems to Heidegger to be "fantastic." Against the background of this relativity of truth to the being of Dasein, Heidegger asks anew: why must we presuppose that truth "is given"? His answer is that the possibility of truth (authenticity) and untruth (inauthenticity) belongs to the facticity of human Dasein. From the point of view of existential ontology, the being of human Dasein (its disclosedness) and truth are synonims." (pp. 711-712)

Heridegger on Alétheia

"alétheia and truth: Alétheia is Greek for 'truth; truthfulness, frankness, sincerity'. Aléthés is 'true; sincere, frank; real, actual'. There is also a verb, alétheuein, 'to speak truly, etc' (cf. GA XIX, 21ff.). The words are related to lanthanein, with an older form léthein, 'to escape notice, be unseen, unnoticed', and lithe, 'forgetting, forgetfulness'. An initial a- in Greek is often privative, like the Latin in- or the Germanic un-. (The 'privative alpha' occurs in many Greek-derived words: 'anonymous', 'atheism', etc.) Aléthés, alétheia are generally accepted to be a-léthes, a-létheia, that which is 'not hidden or forgotten', or he who 'does not hide or forget'.

We reach the 'essence of truth', the 'openness of the open', from two directions: from 'reflection on the ground of the possibility of correctness (adaequatio)' and from 'recollection of the beginning (alétheia)' (GA LXV, 338). The first procedure is characteristic of *Being and Time* and early lectures, the second of later works. But early on Heidegger says that alétheuein is 'to take out of hiddenness [Verborgenheit], to uncover [entdecken]' (GA XXII, 25. Cf. GA XXI, 131; *Being and Time*, 33, 219); alétheia is 'uncovering' (GA XXI, 162); and aléthes is 'unhidden [Unverborgen(es)]' (BT, 33, 219). This has three implications: 1. Truth is not confined to explicit assertions and discrete mental, primarily theoretical, attitudes such as judgements, beliefs and representations. The world as a whole, not just entities within it, is unhidden - unhidden as much by moods as by understanding. 2. Truth is primarily a feature of reality - beings, being and world - not of thoughts and utterances. Beings, etc. are, of course, unhidden to us, and we disclose them. Heidegger later coins entbergen; Entbergung; Entborgenheit, 'to unconceal; -ing; -ment', since unlike unverborgen, they can have an active sense: 'aléthes means: 1. unconcealed [entborgen], said of beings, 2. grasping the unconcealed as such, i.e. being unconcealing' (XXXI, 91). But beings, etc. are genuinely unconcealed; they do not just agree with an assertion or representation. 3. Truth explicitly presupposes concealment or hiddenness. DASEIN is in 'untruth [Unwahrheit]' as

well as truth. In *Being and Time* (222, 256f.) this means that falling Dasein misinterprets things.

'Untruth' is not plain 'falsity', nor is it 'hiddenness': it is 'disguisedness [Verstelltheit]' of the truth (GA XXXI, 91). Later, 'untruth' is still not 'falsity', but 'hiding, concealing [Verbergung]' (GA LXV, 362). What conceals is no longer man, but being. There are two types of unconcealing: (a) of the open, the world or beings as a whole; (b) of particular beings within this open space. The first type (a) involves concealment: everything was hidden before the open was established, and concealment persists in that the open reveals only certain aspects of reality, not its whole nature. The second type (b) involves a concealment that we overcome 'partially and case by case' (GA LXV, 338f.). Plato errs in assimilating truth to light. We lose the idea of hiddenness and thus the privative force of a-létheia: the light is constant - never switched on or off - and reveals everything there is to anyone who looks. We lose the idea of the open, which must persist throughout our unconcealing of beings: a single light cannot account both for the openness of the open and for the unconcealing of particular entities (LXV, 339).

Plato's error was fateful. He - not Aristotle, who did his best to repair the damage (*Nietzsche* II, 228 / Nietzsche IV [English translation], 171) - initiated the decline of a-létheia into 'correctness' and truth as agreement (GA XXXIV, 21ff; *Platons Lehre von der Wahrheit*, 201ff./ 215ff.). Alétheia was originally the basic feature of phusis (roughly, 'nature') and thus 'essentially rejects any question about its relation to something else, such as thinking' (LXV, 329). In Plato it 'comes under the yoke of the idea' (Platons Lehre von der Wahrheit, 228). Idea, from the Greek idein, 'to see', refers, on Heidegger's account, to the visual 'aspect [Aussehen]' of entities. The ascent of the prisoners out of the cave is a progressive 'correction' of their vision of this idea and the entity whose idea it is. Hence alétheia is no longer primarily a characteristic of beings: it is 'yoked' together with the soul, and consists in a homoiósis, a 'likeness', between them. Homoiósis has since become adaequatio and then 'agreement', and since Descartes, the relation between soul and beings has become the subject-object relation, mediated by a 'representation', the degenerate descendant of Plato's idea. Truth becomes correctness,

and its 'elbow-room [Spielraum]', the open, is neglected (GA LXV, 198, 329ff.)." (pp. 13-14)

Heidegger Gesamtausgabe, Frankfurt: Klostermann 1975ss. = GA

From: Michael Inwoord, *A Heidegger Dictionary*, Oxford: Blackwell Publishers 1999.

The "Romanization" of truth: from ἀλήθεια to veritas

"As Heidegger puts it elsewhere, in Plato and Aristotle beings with the *gigantomachia*, the struggle between Being and beings, for Being is now understood as the highest or first being (GA [*Gesamtausgabe*] vol. 33, pp. 24, 43-44; cf. *The End of Philosophy*pp. 9-10). As he explains in his wartime Parmenides lectures, in and with the philosophical tradition's understanding of truth and falsehood, *aletheia* is opposed to *pseudos*, to falsehood in the sense of incorrectness, which displaces the inceptive Greek senses of unconcealing and concealing (GA Vol. 54, pp. 24-56). The translation of *aletheia* as *veritas* is related to the political-moral economy of ancient Rome, and therewith, Heidegger makes clear, to the manifold successors to Rome: medieval Christianity, modernity, Nietzsche, and--I agree with William V. Spanos on this point--National Socialism (pp. 57-72).(14)

The Latin *falsum* has the sense of "bringing to a fall" or "downfall," which is "only a subsequent effect [*Wesensfolge*] within the essential domain [*Wesensbereiches*] of dissembling and concealing which makes up the essence of psuedos" (p. 58).(15) "Imperium" and the "imperial" constitute the "essential domain" decisive for the "experiential domain" (*Erfahrungsbereich*) in, from, and for which "bringing to a fall" acquires its status as the designation for the counter-essence of "what the Greeks experience as *alethes*, the 'unconcealing' and the 'unconcealed.' " The experience of *imperium* is that of "command," of the taking over of a territory, which is ruled

by commandment. "Command," then, is the "essential ground of sovereignty" (*Wesensgrund der Herrschaft*) and, moreover, describes the characteristic actions of the god of the Old Testament and the gods of Rome, but not those of Greece (p. 59). In a further specification, "command" determines Roman law and right, *ius* and *iustum*; *iustitia* "has a wholly other [*ganz anderen*] essential ground than that of *dike*, which arises from *aletheia*." "Being superior" (*Obensein*) belongs to "command" and is the "constant surmounting [*Überhöhung*] of others, who are thereby the inferiors [*Unteren*]." Surmounting requires the power to "oversee" (*übersehen*), which means, therefore, to "dominate" (*beherrschen*) (59-60). The "overseeing" of *imperium* requires constant "action," by which enemies or rivals will be brought to fall through " 'direct' attack" (*Ansturm*) or "subterfuge" (*Hintergehen*) or "trick," which, "not accidentally," is an "English" word (p. 60). Those who fall are not destroyed but rather "raised up" (*aufgerichtet*) within the boundaries established by those who rule; this "fixing" (*Abstecken*) is Roman peace. Indeed, the greatness of the imperial, Heidegger writes, lies in the subterfuge by which it secures its dominion. The expansion of early Rome through treaties and treachery shows this (pp. 60-61).

The "Romanizing" of the Greeks conditions not only all subsequent understanding of them in the history of the West but also the historical and metaphysical *Auseinandersetzung* of the modern world and antiquity. Even Nietzsche's metaphysics, as a modern attempt to recover antiquity, is conditioned by Rome and thus is ultimately "unGreek." The Roman experience of beings, encountered under the "Roman stamp" (*der Romisch Prägung*), reaches into Christianity and hence to the medieval and modern ages (pp. 64-72; cf. *The End of Philosophy* p. 13). "Romanization in the essential sense of the Greco-Roman historical domain," Heidegger writes, must be understood as a "change in the essence of truth and Being"; it is an "authentic event [*Ereignis*] in history" (p. 63). The transformations of *aletheia* and *pseudos* as correlates with the imperial experience mark an epochal boundary. "The imperial as a mode of Being of historical collectivities [Menschentums]," Heidegger explains, is not the ground for the essential change of *aletheia* into truth as correctness but is rather a following of the

enfolding of truth into the meaning of correctness (pp. 62-63). Heidegger makes clear that there is something "make-shift" (*Notbehelf*) in the phrase "change in the essence of truth," which does not speak clearly enough of the way "in which it unfolds itself and history 'is' (wie sie selbst west and die Geschichte 'ist']" (p. 63). This process exhibits the inner connection of the coherent modes of action which ground Western history, and is not to be understood causally." (pp. 180-181)

Notes

Selected Bibliography on Heidegger's Interpretation of *Aletheia* as Unconcealment

Heidegger's main texts on Alétheia and Veritas

Abbreviations: GA = Gesamtausgabe (Collected works); SS = Summer semester (from May to July); WS = Winter semester (from November to February)

In his work *Besinnung* (GA 67 p. 107), Heidegger give a list of nine texts where he examines the question of truth (I cite from the English translation, *Mindfulness*, translated by Parvis Emad and Thomas Kalary, New York, Continuum, 2006, pp. 89-90:

"Question of Truth: A directive.

1. *Vom Wesen der Wahrheit* (lecture of 1930) (1); in addition, interpretation of the simile of the cave in the lecture-course of 1931/32 (2)

2. *Vom Ursprung des Kunstwerks* (Freiburg lecture of 1935) (3)

3. Vom Ursprung des Kunstwerks (Frankfurt lectures of 1936) (4)

4. *Vom Wesen der Wahrheit* (lecture of 1937/38) (5)

5. *Die Grundlegung des neuzeitlichen Weltbildes durch die Metaphysik* (lecture of 1938) (6)

6. *Anmerkungen zu Nietzsches II. Unzeitgemässe Betrachtung, Abschnitt VI Wahrheit und Gerechtigkeit,* lecture-seminar of

1938/39 (7)

7. Lecture course of summer semester of 1939 (Nietzsche, *Wille zur Macht*, III. Buch, Der Wille zur Macht als Erkenntnis) (8)

8. *Beiträge zur Philosophie*, 1936, section: *Gründung* (9)

9. *Zu Aristoteles, Physik B 1 (physis), third term of 1940, pp. 22 ff. (10)"*

Notes:

(1) To appear in *Vorträge*, GA 80.

(2) See *Vom Wesen der Wahrheit: Zu Platons Hölengleichnis und Theätet*, lecture in the summer semester of 1931/32, GA 34, ed. Hermann Mörchen (Frankfurt am Main: 1988).

(3) To appear in *Vorträge*, GA 80.

(4) See *Holzwege*, GA 5, pp. 1-74.

(5) See *Grundfragen del Philosophie. Ausgewählte "Probleme" der "Logik"*, lecture in the winter semester of 1937/38, GA 45 ed. F.-W. v. Hermann (Frankfurt am Main: 1984).

(6) Published under the title "Die Zeit des Weltbildes", in *Holzwege*, GA 5, pp. 75-113.

(7) See *Zu Auslegung von Nietzsches II: Unzeitgemasse Betrachtung*, lecture-seminar in Freiburg in the winter semester 1938/39, GA 46, ed. Hans-Joachim Friedrich (Frankfurt am Main: 2003).

(8) See *Nietzsches Lehre vom Willen zur Macht als Erkenntnis*, lecture of the summer semester of 1939, GA 47 ed. Eberhard Hanser (Frankfurt am Main: 1989).

(9) See *Beiträge zur Philosophie (Vom Ereignis)*, GA 65, ed. F.-W. v. Hermann (Frankfurt am Main: 1989) pp. 293-392.

(10) On the 'fore-concept' of 'metaphysics', elucidated out of Aristotle's concept of *physis* see *Metaphysik und Wissenschaft*, to appear in GA 76.

The following is a more complete list in chronological order; references are to the German edition of the complete works by Martin Heidegger.

The first date is that of the Gesamtausgabe volume, English translation are cited when available.

1. Heidegger, Martin. 1989. *Phänomenologische Interpretationen zu Aristoteles. Ausarbeitung für die Marburger und die Göttinger Fakultät (1922)*

   First German edition 1989; new edition Stuttgart, Reclam, 2003.

   Phenomenological Interpretations in Connection with Aristotle. An Indication of the Hermeneutical Situation, in: Martin Heidegger, *Supplements. From the Earliest Essays to Being and Time and Beyond,* edited by John van Buren, New York: State University of New York Press, 2002, pp. 111-145.

   On *Aletheia* see: *Eth. Nic. VI,* pp. 129-145.

2. ———. 1994. *Einführung in die phänomenologische Forschung*

   Lecture course at the University of Marburg, WS 1923-1924.

   GA 17, 1994.

   Introduction to Phenomenological Research, Bloomington: translated by Daniel O. Dahlstrom, Indian University Press, 2005.

   See Chapter Four: *Going Back to Scholastic Ontology: the VerumeEsse in Thomas Aquinas,* pp. 120-147.

3. ———. 1992. *Platon, Sophistes*

   Lecture course at the University of Marburg, WS 1924-1925.

   GA 19, 1992.

   Plato's Sophist, translated by Richard Rojcewicz and André Schuwer, Bloomington: Indiana University Press, 1997.

   See in particular:

Preliminary Considerations § 3. First Characteristic of *alétheia* pp. 10-13.

Introductory Part: The Securing of *alétheia* as the Ground of Plato' s Research into Being. Interpretation of Aristotle: *Nichomachean Ethics* Book VI and Book X, Chapters 6-8; *Metaphysics* Book I, Chapters 1-2, pp. 15-155.

4. ———. 1976. *Logik. Die Frage nach der Wahrheit*

   Lecture course at the University of Marburg, WS 1925-1926.

   GA 21, 1976.

   Logic. The Question of Truth, translated by Thomas Sheehan, Bloomington, Indiana University Press, 2010.

   Translated in Italian as: *Logica. Il problema della verità* by Ugo Maria Ugazio - Milano, Mursia, 1986.

5. ———. 1977. *Sein und Zeit*

   First edition 1927. GA 2, 1977.

   Being and Time, translated by by John Macquarrie and Edward Robinson (1962); reprinted Oxford: Blackwell, 2000.

   Also translated by Joan Stambaugh, New York: State University of New York Press, 1996.

   See § 44: *Dasein, Disclosedness, and Truth*

   a) The traditional conception of truth, and its ontological foundations;

   b) The primordial phenomenon of truth and the derivative character of the traditional conception of truth;

   c) The kind of being which truth possesses, and the presupposition of truth.

6. ———. 1996. *Einleitung in die Philosophie*

   Lecture courses at the University of Freibug, WS 1928-1929.

   GA 27, 1996.

   Not translated in English.

Italian translation: *Avviamento alla filosofia,* edited by Maurizio Borghi with the collaboration of I. De Gennaro and G. Zaccaria, Milano: Christian Marinotti Edizioni, 2007.

See Chapter 3: *Wahrheit und Sein. Vom ursprunglichen Wesen der Wahrheit als Unverborgenheit* pp. 68-124.

7. ———. 1967. *Vom Wesen der Wahrheit*

   Lecture given in 1930, first edition 1943.

   Reprinted in: *Wegmarken (Essays 1919-1961)*, 1967 pp. 177-202.

   GA 9, 1976. Revised and expanded 1978.

   "Heidegger seeks to show the purely revelatory nature of the concept of truth when applied to the intellection of essences which, in 0 10. A. distinguishes this from the truth of judgements. In his 1925-6 course on logic *(Logik. Die Frage nach der Wahrheit)* Heidegger follows Bonitz in adding a negation *(ouk)* at 1051 b 32-3 and thus reading the passage as saying, 'with respect to these things, we search for what a thing always is and not whether it has this nature or not'. This negation is not to be found in any manuscript and may derive from a comment by pseudo-Alexander, who wanted to see in this passage an allusion to the vision of God. But, for Aristotle the intellection of essences too is infallible in the sense that the only alternative is ignorance. It is expressed in a definition and so does require that we enquire into whether it has this nature or not."

    "The purpose of the article is a reassessment of Heidegger's central and dominating assertion on the role of *aletheia* in the origin of Occidental thought. It demands an epoché that allows for transcending resolutely his stance in the horizon of modernity -- as achieved by the distinction of the tasks of "reason" realized in its either "natural" or "mundane" or "conceptual" determination (cfr. H. Boeder, "Seditions", State University of New York Press 1997, ed. by Marcus Brainard). Only the latter has introduced the topic of aletheia into philosophy; contrary to Heidegger's assumption of an original

concealment of physis. Not this, but the thematization of a primary logos and its divine revelation motivated the Parmenidean discussion of truth as distinct from human opinion. How then does Heidegger approach the truth in the first epoch of philosophy? Only seemingly. In truth -- *quod erat demonstrandum* --he deviates in each case and obliterates its motive thoroughly. He fulfills the modern destiny of thought not to recognise the achievement in conceptual thinking. His is an apocalyptic destiny, that he shares with Marx and Nietzsche -- not approaching to any fulfillment, but exhaustion. In this he is of admirable consequence: that of the "evil eye" (Nietzsche). It dooms necessarily, what was formerly regarded as "metaphysics". What enables to dismiss this assessment properly? In one word: the epoché due to "logo-tectonics".

17. Brancacci, Aldo. 1990. "Le vrai et le droit: la notion d'*orthon* chez Mélissos." In *La naissance de la raison en Grèce. Actes du Congrès de Nice, mai 1987*, edited by Mattéi, Jean-François, 197-206. Paris: Presses Universitaires de France.

    "Dans sa *Platons Lehre* Heidegger a consacrè des pages fort intéressantes à la mise en évidence du concept d'*orthotés*, dont le philosophe allemand retrouve, à tort, la première formulation chez Platon. Il est bien connu que, pour Heidegger, l'instauration de la notion de *Richtigkeit* marquerait l'avènement d'une primauté de l'*idea* sur l'*alethéia*: donc la constitution d'un concept de "cohérence" qui se substituerait à la notion de vérité comme dévoilement (*Unverborgenheit*). Dans cette perspective, l'*orthotés* en viendrait à exprimer l'adéquation entre le percevoir et l'énoncer, le se diriger (*Sichrichten*) qui se conforme (*gleicht an*) à ce qui doit être vu (*was gesichtel sein soll*), condition préalable d'une conception de la vérité comme adaequatio (19). Les textes de Mélissos que j'ai examinés montrent combien cette interprétation -- qu'Heidegger lui-même a rétractée dans un écrit de 1964, sans

pourtant mettre en question la compréhension du concept d'ortothés qu'elle suppose (20) -- doit être revue et repensée. En effet, si l'on peut admettre que la constitution de la notion d'*ôrthón* est liée à l'instauration d'une conception du vrai qui pose le Sujet par rapport à l'Objet, il n'en reste pas moins que cette notion apparaît comme la conséquence de la thèse ontologique elle-même, qui l'engendre nécessairement et dont elle continue de dépendre. En d'autres termes, c'est à partir des thèses éléatico-mélissiennes qui posent l'être que s'élabore un concept d'*orthon* envisagé comme le critère qui rend possible la connaissance, ou qui la rendrait possible au cas où le *ghinoskein* aurait comme objet la réalité: *ta onta*. Dans les deux cas, la notion de relation est une notion centrale et désigne tantôt un lien positif, constitutif, entre le principe de la réalité et l'articulation de l'être en concepts, tantôt l'échec de la relation qui s'instaure, au sein d'un monde dépourvu de fondement ontologique, entre les facultés de la connaissance et leur objet, entre la réalité, toujours présupposée, et son apparaître. Dès lors, je crois être en mesure de conclure que le concept mélissien de rectitude exprime une notion éminemment catégoriale: *orthon*, entendu donc en tant qu' "orthogonalité", où Sujet et Objet sont à la fois unis et distincts." pp. 205-206

    "Heidegger's attack on metaphysics is equivalently an attack on Platonism. Brief comments about Plato are not uncommon in Heidegger's published works, but there is only one published essay devoted exclusively to a text of Plato: *Plato's Doctrine of Truth*.

    This essay's principal thesis is that Plato transformed the notion of truth from unconcealment (*Unverborgenheit*) to correctness. Though this was written at a time (1930/31) when Heidegger's thought was making the famed and controverted turn (*Kehre*), the critique of Plato remains essentially the same throughout Heidegger's work. There is, of course, the late concession in *The End of Philosophy and the Task of Thinking* that "the assertion about the essential transformation of truth [in Plato] ... from unconcealment to correctness is... untenable." But, as we will see below, this does not alter Heidegger's unrelenting critique of Plato. Unlike other aspects of Heidegger's work, his Plato critique has not elicited widespread discussion, presumably because he himself wrote so little on Plato. The best responses to Heidegger's essay on Plato have come from those close to and sympathetic with Heidegger's work yet unsympathetic with his Plato interpretation."

    "Martin Heidegger insists, in his 1941-42 lecture course on Friedrich Hölderlin's "Andenken," that it is the poet who institutes (*stiftet*) history, whereas the thinker establishes its foundation (*grundet*). In his Parmenides lectures of the following year, Heidegger interlinks this poetico-philosophical understanding of historical origination with the problematic of *aletheia* which, by his own account, had preoccupied him intensely since the early 1930s, and which he then still understood in the sense of truth, rather than in the later sense of the pure opening (*Lichtung*). Although, as Jürgen Habermas points out, Heidegger "rigidly maintained the abstraction of historicity (as the condition of historical existence itself) from actual historical processes," his effort to think historicity as rooted in the aletheic "power to bring to word," which he pits against "a crude biological interpretation of history" (PL 83), carries historicopoliticaI import. This import and concern are not explicitly thematized; but they account for the fact that, as Manfred Frings notes, "long stretches of the lecture hardly deal with Parmenides himself" but seem to ramble over a bewildering plethora of topics. Frings advocates conjoining the text with Heidegger's 1943-44 lectures on Heraclitus which continue to develop a similar problematic. The present essay, however, will focus strictly on the Parmenides lectures. It will seek to show not only that this text is meaningfully organized and internally coherent, but also that it reveals certain important aspects of the historicopolitical dimension of Heidegger's thought." pp. 71-72 (notes omitted).

    "This paper is written against the background of Heidegger's grasp of the destruction of metaphysics and its end in Nietzsche's concept of world, history and values through absolute subjectivity (over-man). It traces pre-socratic thought in light of the absence of subjectivism in Protagoras by showing how his fragment deals with being and nothingness, not with subjective relativism (sophism). Heidegger's identification of 'aletheia' and 'chaos' (Hesiod) is complemented by a novel look at the origin of language and myth."

38. ———. 1988. "Parmenides: Heidegger's 1942-1943 Lecture Held at Freiburg University." *Journal of the British Society for Phenomenology* no. 19:15-33.

"In what follows, I wish to present a number of essentials of Heidegger's lecture, originally entitled, "Heraclitus and Parmenides," which he delivered at Freiburg University in the Winter Semester of 1942/1943. This was at a time when the odds of World War II had turned sharply against the Nazi regime in Germany. Stalingrad held out and the Germans failed to cross the Volga that winter. Talk of an impending "invasion" kept people in suspense. Cities were open to rapidly increasing and intensifying air raids. There wasn't much food left.

It is amazing that any thinker could have been able to concentrate on pre-Socratic thought at that time. In the lecture, there are no remarks made against the allies; nor are there any to be found that would even remotely support the then German cause. But Communism is hit hard once by Heidegger, who says that it represents an awesome organization-mind in our time.

There are two factors that somewhat impeded my endeavor of presenting the contents of this lecture:

1. Heidegger had originally entitled the lecture "Heraclitus and Parmenides." The 1942/43 lecture was followed in 1943 and 1944 by two more lectures on Heraclitus. When I read the manuscripts of the 1942/43 lecture for the first time, I was stunned that Heraclitus was mentioned just five times, and, even then, in more or less loose contexts. I decided that the title of the lecture should be reduced to just "Parmenides" in order to accommodate the initial expectations of the reader and his own thought pursuant to having read and studied it.

2. While reading the lecture-manuscripts for the first time, another troubling technicality came to my attention: long stretches of the lecture hardly even deal with Parmenides himself, and Heidegger seems to get lost in a number of areas that do, *prima facie*, appear to be irrelevant to Parmenides. And Heidegger was rather strongly criticized for this in the prestigious literary section of the *Frankfurter Allgemeine Zeitung* to the effect that it was suggested that I could have done even better had I given the lecture an altogether different title and omitted the name Parmenides."

(Notes omitted).

39. ———. 1990. "Heraclitus: Heidegger's 1943 Lecture Held at Freiburg University." *Journal of the British Society for Phenomenology* no. 21:250-264.

    "In what follows I wish to present the pivots of thought of the second of three lectures on Pre-Socratic thought Heidegger held during the period of 1942-1944. The content of the first, *Parmenides*, was covered in this Journal's Vol. 19, No. 1 (January 1988). When Heidegger delivered the second lecture that we are about to familiarize ourselves with, he was fifty-five years of age, and yet to live another thirty-three. During this remaining time of his life he gained global attention, albeit not always acceptance of his thought.

    The summer of 1943 during which the second Pre-Socratic lecture was delivered, entitled: *Heraclitus. The Inception of Occidental Thought*, was marked by the end of the African and Sicilian campaigns of World War II, the breakdown of the German-Italian axis, and Mussolini's downfall. As was the case with the 1942/43 Parmenides lecture, Heidegger appears to have secluded himself from the turmoil of the War. His thought appears to dwell near the Inception of Western thought, out of which his own time, too, must have grown.

    As I indicated at the beginning of the transferring into English of the pivotal points of the Parmenides lecture, the three lectures - as can clearly be seen from what follows - must be studied, and comprehended, in conjunction with one another in order to fully comprehend his doubtless novel contribution to the study of the Pre-Socratics.

    On Heidegger's own invitation in 1976, I edited this second, and the third (1944) Heraclitus lectures for Vol. 55 of the German *Gesamtausgabe* (Collected Edition). Concerning the general state of the manuscript involved, I wish to refer the reader to my technical remarks to the coverage of the *Parmenides* lecture.

    The last of the three Pre-Socratic lectures by Heidegger, entitled: *Logic. Heraclitus' Doctrine of Logos* (1944), will also

appear in this Journal."

40. ———. 1991. "Heraclitus: Heidegger's 1944 Lecture Held at Freiburg University." *Journal of the British Society for Phenomenology* no. 22:64-82.

    "There are two crucial points to be made concerning our third pre-Socratic lecture:

    (1) The main goal of the 1943 Heraclitus lecture had been to establish an arrangement of ten Heraclitian fragments in terms of "thinking proper" (*eigentliches Denken*). Heidegger thought through ten fragments of which the second through the tenth were "falling into", as I then put it, the first, namely, Diels fragment 16. This "first" fragment we showed to be not "first" in terms of a sequence; rather, it showed itself as both center for, and surrounding the other eight. Further, it was shown that Heidegger's first fragment (16) does not "contain" the rest, but that it is "nearest" the "inception" itself of thinking-proper. Thus, the arrangement of the nine fragments falling into the scope of 16 ensued from thinking-proper, and neither from logical nor speculative argument.

    (2) By contrast, the present 1944 Heraclitus lecture does not continue on from what had in 1943 been achieved. Heidegger does not investigate further fragments in the light of the exceptional, and inceptional, significance of fragment 16. Surprisingly enough, in 1944 fragment 16 is mentioned only three times (320, 350, 391). Instead, he now tells us that he will check into fragments "chosen" because of their containing the word "logos". This very different, now objective procedure brings with it that the 1944 lecture is only loosely tethered to the preceding two lectures which, we saw, are much intertwined. One such loose tether was already hinted at in the coverage of the 1943 lecture when we stated: "Logic, too, cannot match thinking proper. It cannot reach into the inception from which its own territory arises. The next 1944 Heraclitus lecture will have to say a lot more on this point." Some of the other links to the previous lectures will be shown in what follows.

    The first 1943 Heraclitus lecture I divided into two parts in its German edition in Volume 55 of the Collected Works

(Gesamtausgabe). I, on the other hand, divided the manuscripts of the 1944 lecture into three parts. Heidegger left it to the judgment of the editors that such divisions and other minor emendations be made to secure the maximum of clarity. My threefold division of the manuscripts will guide us in the following coverage of the lecture:

1. Logic: Its Name and Subject-Matter.

2. The Staying-Away of Original Logos and the Paths of its Access.

3. Regress into the Original Region of Logic."

41. ———. 1991. "Heidegger's Lectures on Parmenides and Heraclitus (1942-1944)." *Journal of the British Society for Phenomenology* no. 22:197-199.

"This is a discussion of the coverage of three Lectures Heidegger held on Parmenides and Heraclitus from 1942 to 1944. It is designed on the background of his personal experience during the trip he made to Greece in 1962 as recorded in his diary. The question is raised whether his 1943 arrangement of 10 Heraclitus fragments could be extended by "refitting transformations" of other fragments. The three Lectures are seen as tethered to Heidegger's 1966/67 Heraclitus Seminar. Central to his trip was the island of Delos where he seemingly experienced the free region of Aletheia. A "fragment" in his diary is suggested as a motto for all three Lectures."

"First, it is shown that Gethmann has raised a convincing objection to Tugendhat's interpretation, according to which, Heidegger's definition of truth goes beyond that given by Husserl. Contrary to Tugendhat's view, Gethmann argues that Heidegger has not moved away from Husserl's definition of truth. Gethmann claims that Heidegger rather uses "truth" with two different meanings, one referring to the truth of assertions, whereas the second ("truth in a more primordial sense") describes the preconditions for the first. Secondly, with regard to this relationship, it is argued that Heidegger and Gethmann cannot provide an adequate analysis, primarily because truth in

the primordial sense does not account for the difference between being true or false."

51. Grieder, Alfons. 1988. "What Did Heidegger Mean by "Essence"?" *Journal of the British Society for Phenomenology* no. 19:64-89.

    "The word `Wesen' (`Essence') frequently occurs in Heidegger's writings. It is indeed one of his key-words. Unless we understand what he means by it we are unlikely to understand his philosophy. After all, philosophy was for him essential thinking (*wesentliches Denken)*. Yet 'Wesen' is also one of his most enigmatic terms and greatly in need of elucidation, despite the fact that he commented on its meaning in many places, scattered throughout his writings, from the thirties right through to the seventies. It is not only tedious to collect these comments but, as we shall soon see, difficult to understand and adequately interpret them.

    In the following I shall focus on the three periods 1925-30, 1934-38, and 1949-57. In all three periods Heidegger's meaning of `Wesen' is inseparable from that of 'Sein' (`Being') and `Wahrheit (`Truth'), and by the fifties its connection with 'Language', 'World' and 'Thing' assumes a new significance. From the mid-thirties he uses the word in an increasingly unfamiliar and puzzling manner. Its change of meaning is closely associated with the famous 'turn' ('Kehre'). One has to come to grips with this metamorphosis, otherwise what the later Heidegger has to say, for instance on art and technology, will hardly be intelligible.

    Unfortunately, few commentators have bothered to analyse this term 'Wesen', and to my knowledge none has done so in sufficient detail and in a way which makes sense to the uninitiated too. Obviously, little is achieved by simply repeating Heideggerian phrases and assertions as if they were crystal-clear. (As a rule they are not at all.) I am aware, of course, that the following remarks and analyses are still in some sense provisional and cannot fill this important gap in the Heidegger literature: they will almost certainly have to be complemented

and revised in the light of the many still outstanding volumes of the *Gesamtausgabe*."

54. Hahn, Robert. 1979. "Truth (*alétheia*) in the context of Heidegger's critique of Plato and the Tradition." *Southwest Philosophical Studies* no. 4:51-57.

    "According to Heidegger, the Pre-Socratic experience of "truth" as "unconcealment" is transformed by Plato so that "truth" becomes "correctness of perception" -- this marks both the origin of the "western tradition" and its decline. The paper examines Heidegger's "fourfold", a twentieth century expression of truth as "unconcealment", as a constructive response to the shortcomings of the "Tradition". Finally it is suggested that one way of reading what I call the "fourfold" in Plato's "Philebus" and "Timaeus" is to see Plato's project as the very one which Heidegger sets out to accomplish and which he denies to Plato."

    See Chapter One: *Heidegger's Plato* pp. 17-122.

    "I shall begin with Heidegger's early (winter semester, 1924-25) lecture course on Plato's *Sophist*, where Heidegger, still very strongly under the influence of Husserlian phenomenology, interprets Plato (and Aristotle) largely from the standpoint of the exitent to which they prepare the way tor something like philosophy as scientific research in the phenomenological mode. From this vantage point, as we shall see in detail, Plato is to be criticized as falling far short of Aristotle. Since this is the only work of Heidegger's that engages in a thorough interpretation of an entire Platonic dialogue, I shall examine it in the greatest detail. The second text to be considered will be, significantly, Heidegger's only formally published work on Plato, "Plato's Doctrine of Truth," from 1931 to 1932 (although I shall also consider briefly several lecture courses from the same time period). There, Plato will again be criticized, but this time more as the thinker who begins the fateful transformation of *aletheia*, truth as "unhiddenness," into truth as "correctness," and so the beginning of the "forgetting of Being" that becomes the Western metaphysical tradition. As such, Plato's thinking is, so far as possible, to be got beyond, if not indeed overcome. Later, as Heidegger becomes more oriented toward the poetical and even mythic, both in his writing style and the matters he

addresses, he becomes somewhat more sympathetic to Plato and to the dialogue form, while remaining in the end still profoundly suspicious of Plato's thought. I shall consider third, then, an example from this later, more poetic period in Heidegger's thinking, his 1943-44 lecture course on *Parmenides*. I shall there suggest that Heidegger's own movement away from philosophy as science and toward a more poetic way of thinking ought to make him much, much more sympathetic to Plato than he in fact becomes. Finally, I shall consider two works of Heidegger's in which Plato is never mentioned, but in which it might be argued that the influence of Plato is -- or ought to be -- most apparent: Heidegger's two later attempts at writing dialogues, the "Dialogue with a Japanese," and "Conversation on a Country Path." There, we shall evaluate Heidegger's engagement not so much with his assessment of Plato's so-called doctrines, but with the Greek's choice of writing format." pp. 17-18

    Reprinted in D. F. Krell, *Intimations of Mortality. Time, Truth, and Finitude in Heidegger's Thinking of Being*, University Park: Pennsylvania State Press, 1986, pp. 67-79 with the title: The Manifold Meaning of *Alétheia*.

    "Do the intimations of mortality in Heidegger's thought evanesce once he has abandoned the project of fundamental ontology? Or does the object of his fundamental ontology — finite existence as the site of all understanding of Being perdure even after the meta ontological and frontal ontological turns? Does not the site of such understanding of Being, broaching as it does the questions of the *truth* and the *clearing* of Being, persist in bearing traces of finitude? That truth is always accompanied by untruth, and clearing by concealing and withdrawal — are these not also intimations of mortality in Heidegger's work?

    The following three chapters will try to trace these intimations in Heidegger's interpretation of truth as *alétheia* and of the clearing of Being as revealing concealing. They will do so by focusing on three quite specific themes: first, Heidegger's early "discovery" of the question of "truth" and "being" in Brentano's Aristotle: second, the burgeoning notion of "the clearing" in *Being and Time* and in the later work; and third, the question of the imputed "turning" from Man to Being in Heidegger's career of thought.

Let me now address the first of these themes. One of the four senses attributed to "being" in Franz Brentano's dissertation on Aristotle is *on hós aléthes*, "being in the sense of the true." Does Brentano's account of "being in the sense of the true" have significant bearing on Heidegger's response to *alétheia* as the unconcealment of beings in presence? This chapter tries to answer that question by offering (1) a general account of Brentano's thesis, (2) a detailed résumé of its third chapter, concerning *on hós aléthes*, (3) a condensed treatment of what John C. Caputo lias called Heidegger's "alethiological" notion of Being, and (4) a summary of results." (p. 67)

"A historical discussion of the intellectual relationship between Husserl and Heidegger and an analysis of articles on Plato's cave allegory by Heidegger and Fink demonstrates: (1) that Heidegger's project is true to (not contrary to) the spirit of Husserl's phenomenology by its being a more radical quest into "presuppositions" questioning the "givenness" of the structure of intentionality; (2) Fink's "what does the phenomenology of Edmund Husserl want to accomplish," throws light on the discussion of Bildung in Heidegger's "Plato's doctrine of truth." Fink and Husserl perceive the allegory as primarily concerned with "education;" Heidegger perceives the "unsaid" of the shift in the essence of truth from *aletheia* to *adaequatio intellectus et rei*, indicating a difference of focus for both projects rather than contradictions between them; and (3) essay concludes by suggesting that an adequate "phenomenological" description of the constituting of meaning in consciousness requires sensitivity to both moments: Husserl's description of intentionality and Heidegger's Seinfrage."

Reprinted in: Harold A. Durfee (ed.) - *Analytic philosophy and phenomenology* - The Hague, Martinus Nijhoff, 1976, pp. 125-146.

"In *Being and Time* Heidegger characterizes the traditional concept of truth, which comprises three theses:

(1) The 'place' of truth is the statement (the judgment).

(2) The essence of truth lies in the `correspondence' of the judgment with its object.

(3) Aristotle held theses (1) and (2).

In a later work, *On the Essence of Truth*, he gives the following account of the traditional concept of truth. "A statement is true if what it means and says corresponds with the thing about which it speaks. Also we say here : it agrees *(es stimmt*). But now, what agrees is not the thing but rather the proposition." (p. 7).

Heidegger goes on to say that this agreeing has a twofold character "... on the one hand the agreement of a thing with is meant in advance about it and on the other hand the correspondence of what is meant in the statement with the thing." *(ibid.*) That is, since the agreement or correspondence is a relation between two "terms" -- the statement and the thing

presupposes that both terms can enter into the relation, i.e., agree with one another. The two-fold character of this agreement is determined by these two "aspects" of the relation: the first is the "objective" aspect, where the thing corresponds to the statement or what is meant by the statement, the second is the "linguistic" aspect where the statement or what it means corresponds to the thing. The first is "objective truth," the second "propositional truth."

In this essay I propose to discuss Heidegger's first two theses about the traditional concept of truth (1) and (2) above in terms

of Wittgenstein's own concept of truth as it is presented in his *Tractatus Logico-Philosophicus*. My main purpose in doing so is to see to what extent Heidegger's criticism of this concept is relevant to Wittgenstein and what this criticism really is. That is, I wish to generate a philosophical "dialogue" between these two thinkers who, on the face of it, are worlds apart in their philosophical methods, aims, interests, and conclusions. Many philosophers today, especially those in the English-speaking world, would seriously doubt the possibility of such a dialogue. Even if they admitted that Heidegger's views are meaningful and important they might suppose that what he says is not really relevant to the kinds of problems Wittgenstein, or any other philosopher sharing his philosophical tradition, is concerned with. Thus, my first task is to show what Heidegger says about the traditional concept of truth is relevant to Wittgenstein. Second, in order to show the force of his criticisms they must be presented in such a way that they can be seen to meet Wittgenstein on his own terms. To achieve this a mere confrontation of two opposing philosophical positions must be avoided, at least so far as this is possible. Such an arbitrary confrontation would simply beg the question and lead nowhere. Rather, it must be shown that Heidegger's criticisms point out the inadequacies of Wittgenstein's position from within, and that these inadequacies point to, and can only be overcome by, Heidegger's own position. Heidegger's criticism of the traditional ("correspondence") theory of truth is that it is ultimately inadequate, i.e., it is only a partial and hence dependent explication of the nature of truth, and thus requires a foundation in a radically different understanding of truth, which understanding Heidegger claims to provide. Thus, I must try to show the nature of, and reasons for, this partiality and dependence. In the end, I hope to have indicated why a radically new rethinking of the essence of truth is necessary, and that Heidegger himself has opened up the path for this rethinking. I have oI' this paper. I will begin by discussing thesis (2) (above) - that the essence of truth is a correspondence between judgment and object - and will then Inn) to thesis (I) -- that the "place" of truth is the judgment. However, I wish to emphasize that this division is adopted only

for the purposes of exposition. It will be seen that they are both intimately related, and that this relationship is a necessary one." (Notes omitted). pp. 125-127 of the reprint.

85. Nwodo, Christopher. 1979. "Friedlander *versus* Heidegger: A-létheia Controversy." *Journal of the British Society for Phenomenology* no. 10:84-93.

    "Professor Heidegger is certainly one of the leading philosophers, perhaps the leading philosopher of our time. He has influenced, and continues to influence, in a profound and far-reaching manner, the thinking of contemporary scholars in various fields. He has also given rise to many a controversy particularly in connection with the way he interprets other philosophers and the basic concepts of traditional philosophy. In this article (1) some attempt will be made to analyze one (2) such controversy, namely, Professor Friedlander's disagreement with Heidegger over the latter's interpretation of *a-letheia*. This paper is therefore divided into three parts. Part One deals with a brief analysis of Friedlander's criticism. Part Two attempts a short sketch of the development of the concept of *a-letheia* in the two works of Heidegger cited by Professor Friedlander. Part Three concludes with an evaluation of both views.

    Friedlander's criticism is limited to two works of Heidegger, Sein und Zeit (1927) (3) and *Platons Lehre Von der Wahrheit* (1947), (4) where Heidegger deals with the concept of *aletheia*. In these works Heidegger reconstructs *alethes* and *aletheia* as *a-lethes* and *a-letheia* (with the *alpha* privative). Furthermore, he construes the Greek *a-letheia,* as truth not in the sense of a correspondence or correctness, but as unconcealment or unhiddenness.

    In PLW Heidegger claims that the primordial meaning of a-letheia was unconcealment and that the current interpretation of it as correspondence is a form of degeneration. More

specifically, he situates the beginning of this degeneration in Plato's allegory of the cave (Chapter Seven of the *Republic*). A reasonable thing to do as a contribution to philosophy and to truth would be to reverse this process of degeneration in order to retrieve the original and therefore authentic meaning." p. 84

1. This article developed out of a section of Christopher S. Nwodo: *A Study of Martin Heidegger's Thinking on Art: With Special Reference to "The Origin of the Work of Art."* Louvain University, unpublished doctoral thesis, 1974, pp. 252-257.

2. The word "one" is used in a double sense here. First of all, the *a-letheia* controversy is only one among many. There are others over *Logos* and *Physis*. See J. L. Mehta: *The Philosophy of Martin Heidegger*, New York, Harper & Row, 1971, p. 46 note 65. Secondly, Paul Friedlander's criticism is not the only one concerning *a-letheia*, G. Kruger is also involved. See Mehta, Ibid.

    "The essay concerns two central themes of Heidegger's meditation on the essence of truth, which, intertwining and reacting on each other since the era of *Sein und Zeit*, lead to the *Kehre* of asking what implicitly underlies the lecture *Vom Wesen der Wahrheit*:

    1) the impossibility of the theory, as a genuine discourse on truth, which discounts within its own structure the essence of truth as an auto-presupposition and which inevitably removes the problem;

    2) the radical non-identity and, at the same time, co-appendage of *aletheia* and "truth" (*adaequatio*), that obstructs all dialectical "overcoming", in which it still would act as the presupposition of *aletheia* as the truth of "truth"; rather it refers to impropriety and to intimate discarding, concealed in the very possibility (essence) of the *adaequatio*, which the intellect must assume positively as truth of essence (being)."

89. Peperzak, Adriaan T. 1993. "Heidegger and Plato's Idea of the Good." In *Reading Heidegger. Commemorations*, edited by Sallis, John, 258-285. Bloomington: Indiana University Press.

    "Heidegger's interpretation of Plato, as defended in his publications from 1927 until 1932 and in "Plato's doctrine of truth" (1942) is analyzed and criticized, especially with regard to "aletheia, paideia, idea" and "to agathon". Heidegger's characterization of Plato's thinking as "metaphysics" is challenged and some consequences of a different interpretation are indicated."

90. Philippousis, John. 1976. "Heidegger and Plato's notion of truth." *Dialogue.Canadian Philosophical Review*:502-504.

    "This short discussion tries to re-examine Heidegger's famous interpretation of Plato's notion of "truth" ("Platons Lehre von der Wahrheit") and, proposing a new interpretation of the Platonic idea in the myth of the cave, It reaches the conclusion

that Plato himself understood the notion of *aletheia* not as exactitude (*orthotes*) but as the unfolding of the *ousia* itself."

    Reprinted in: Hubert Dreyfus, Mark Wrathall (eds.) - *Truth, realism and the history of Being* - Heidegger reexamined - vol. II - New York, Routledge, 2002, pp. 53-76.

92. Power, Anne-Marie. 1998. "Truth and aletheia in Heidegger's thought." *De Philosophia* no. 14:109-120.

    "In response to the controversy in the tradition concerning Heidegger's treatment of truth, I argue that Heidegger's early approach to that concept parallels his later approach to language, both of which seek the broader foundation of our common notions. I show that Heidegger takes us behind "truth as adequation" towards a more primordial conceptualization which is rooted in the Greek term, *aletheia*. Time and translation have deprived that word of much of its original meaning, but Heidegger holds that a deeper understanding of truth requires our recapturing its lost sense."

93. Proimos, Constantinos. 2002. "Reading Platonic and Neoplatonic notions of mimesis with and against Martin Heidegger." In *Neoplatonism and the Arts*, edited by Cheney de Girolami, Liana and Hendrix, John, 65-80. Lewiston: Edwin Mellen Press.

    "Analyses some of the reasons for Heidegger's condemnation of the Platonic theory of mimesis, which goes hand in hand with the German philosopher's preference for *aletheia* (non-representational "unhiddenness") over *orthotes* (correctness of representation) in the theory of truth. Yet Heidegger underestimates such Neoplatonists as Plotinus, who also criticizes and transforms Platonic mimesis."

94. Radloff, Bernhard. 2000. "Heidegger's critique of Imperial truth." *Existentia.An International Journal of Philosophy* no. 10:51-68.

"With particular reference to Heidegger's Parmenides of 1942-43, and to the *Contributions to Philosophy*, the author argues that Heidegger offers a critique of imperialism as founded in the transformation of truth from aletheia to veritas. The "imperial" implicates the falseness and subjection of nature, and of a subject population, to the "imperial subject" of modernity. The

argument of the essay is especially unfolded by reference to the political projects of Bacon, Hobbes, and Locke, and concludes that modern technology, and imperial, socio-technical discourses, are intimately linked."

    Abstract: "This thesis tries to provide a critical review of Heidegger's interpretation of ancient Greek truth in the different stages of his career and it also examines the philological response that his work on this question elicited. The publication of *Sein and Zeit* made Heidegger's views on

alétheia available to a wide public and thereby launched a heated debate on the meaning of this word. The introduction tries to give an account of the general intellectual background to Heidegger's interpretation of ancient Greek truth. It also looks at the kind of interpretative approach favored by the philologists responding to Heidegger's views on *alétheia*. The thesis first examines his arguments on ancient Greek truth and language in *Sein and Zeit* from the point of view of the larger philosophical project of Heidegger's seminal work. It then looks at some initial philological responses to Heidegger along with Heidegger's views on *alétheia* in a few works following the publication of *Sein and Zeit*. As a next step, the bulk of the philological work responding to Heidegger is carefully examined with a special focus on the interpretative approaches of the various authors. Heidegger's attempt to respond to some of these philologists is also reviewed. Finally, Heidegger's retraction of his earlier views on *alétheia* is examined in light of a growing critical consensus among philologists. The very latest philological responses to Heidegger are also considered. The conclusion looks at the contributions made by Heidegger and his philological respondents to our knowledge of ancient Greek truth. Some suggestions are also made for future research on this topic."

106. Spanos, William V. 2001. "Heidegger's Parmenides: Greek modernity and the Classical legacy." *Journal of Modern Greek Studies* no. 19:89-115.

    One of Heidegger's most insistent assertions about the identity of modern Europe is that its origins are not Greek, as has been assumed in discourses of Western modernity since the Englightenment, but Roman, the epochal consequence of the Roman reduction of the classical Greek understanding of truth, as a-letheia (un-concealment), to veritas (the correspondence of mind and thing). In the Parmenides lectures of 1942-43, Heidegger amplifies this genealogy of European identity by showing that this Roman concept of truth--and thus the very idea of Europe--is also indissolubly imperial. Heidegger's genealogy has been virtually neglected by Western historical scholarship, including classical. Even though restricted to the

generalized site of language, this genealogy is persuasive and bears significantly on the conflicted national identity of modern, post-Ottoman Greece. It suggests that the obsessive pursuit of the unitary cultural ideals of the European Enlightenment, in the name of this movement's assumed origins in classical Greece, constitutes a misguided effort to accommodate Greek identity to the polyvalent, imperial, Roman model of the polity that informs European colonial practice. Put positively, Heidegger's genealogy suggests a radically different way of dealing with the question of Greek national identity, one more consonant with the actual philosophical, cultural, ethnic, and political heterogeneity of ancient Greece (what Martin Bernal has called the "Ancient Model") and, thus, one less susceptible to colonization by *Europe*."

    "Heidegger has carried on many thoughtful "conversations" with the central figures in the Western philosophical tradition. But one of the sources of this tradition - Plato - is an infrequent protagonist in these conversations. Although a quotation from the Sophist heads *Sein und Zeit* and Heidegger alludes to Plato in a variety of contexts, Plato's work as such is the explicit subject of just a single essay. But that essay expounds an especially important set of interpretations in light of Heidegger's conviction that subsequent philosophy has been a series of distorted variations on Platonic themes. Therefore, an evaluation of Heidegger on Plato is crucial for determining the legitimacy of what Heidegger takes as historically "given" when he attempts to rectify these distortions through his own work!'

    Heidegger's conversations with other philosophers are notorious for their apparently arbitrary stresses, omissions, and random divinations. For example, he has himself admitted that Kant must be handled "with violence" before the ultimate

significance of his philosophy becomes evident. There is substantial evidence to indicate that a "violence" of sorts has been done to Plato as well. But in this case violence is not just wrenching Plato from the shapes which the standard interpreters claim to apprehend. If interpretive violence is required to establish new perspectives on honorable and ancient philosophy, let there be violence. The violence I wish to describe emerges when Heidegger draws inferences from his interpretations of Plato which he claims are incompatible with his own understanding of being (Sein), when in fact he has not given arguments to prove that these inferences must be incompatible. The violence is thus of a rather humble logical form. Plato may well be the primary source of the distortions Heidegger finds in the history of Western philosophy. But Heidegger has not given us reasons to accept the subsidiary claim that these distortions necessarily imply that being is distorted for Plato himself.

My evaluation is divided into three parts. Part I is a summary of Heidegger's essay "Platons Lehre von der Wahrheit," with references to other works introduced when relevant. Part II is a commentary on the key steps in Heidegger's argument. Part III is a defense of Plato against Heidegger in light of the "violence" just mentioned." (p. 118)

"This paper investigates the concept of *aletheia* (truth) in ancient philosophy from the pre-Socratics until Aristotle. The meaning of *aletheia* in archaic Greek is taken as the starting point. It is followed by remarks about the concept of truth in the Seven Sages. The author discusses this concept as it appears in views and works of philosophers and historians. A special section is devoted to the epistemological and ontological understanding of truth. On this occasion, influential views of

Heidegger are examined. The paper is concluded by a review of various meanings of truth in Aristotle."

    Reprinted in: Hubert Dreyfus, Mark Wrathall (eds.), *Heidegger Reexamined*, Vol. II: T*ruth, Realism and the History of Being,* New York: Routledge, 2002, pp. 1-20.

    "I argue in this paper that Heidegger, contrary to the view of many scholars, in fact endorsed a view of truth as a sort of correspondence. I first show how it is a mistake to take Heidegger's notion of 'unconcealment' as a definition of propositional truth. It is thus not only possible but also essential to disambiguate Heidegger's use of the word 'truth', which he occasionally used to refer to both truth as it is ordinarily understood and unconcealment understood as the condition of the possibility of truth. I then show how Heidegger accepted that propositional truth, or 'correctness', as he sometimes called it, consists in our utterances or beliefs corresponding to the way things are. Heidegger's objection to correspondence theories of truth was not directed at the notion of correspondence as such, but rather at the way in which correspondence is typically taken to consist in an agreement between representations and objects. Indeed, Heidegger took his account of unconcealment as explaining how it is possible for propositions to correspond to the world, thus making unconcealment the ground of propositional truth. I conclude by discussing briefly some of the consequences for Heidegger interpretation which follow from a correct understanding of Heidegger's notion of propositional truth."

121. ———. 1999. "The Conditions of Truth in Heidegger and Davidson." *The Monist* no. 82:304-323.

"In this paper I hope to demonstrate that, despite dramatic differences in approach, Analytic and Continental philosophers can be brought into a productive dialogue with one another on topics central to the philosophical agenda of both traditions. Their differences tend to obscure the fact that both traditions have as a fundamental project the critique of past accounts of language, intentionality, and mind. Moreover, writers within the two traditions are frequently in considerable agreement about the failings of past accounts. Where they tend to differ is in the sorts of positive accounts they give. By exploring the important areas of disagreement against the background of agreement, however, it is possible to gain insights unavailable to those rooted in a single tradition.

I would like to illustrate this in the context of a comparison of Heidegger's and Davidson's accounts of the conditions of truth. I begin, however, with a brief discussion of some crucial differences between the Analytic and Continental ways of doing philosophy. An understanding of these differences provides the basis for seeing how Heidegger and Davidson, all appearances to the contrary, in fact follow a parallel course by resisting theoretical attempts at the redefinition or reduction of our pre-theoretical notion of truth. Indeed, both writers believe that truth is best illuminated by looking at the conditions of truth-that is, they both try to understand what makes truth as a property of language and thought possible in the first place. Both answer the question by exploring how , what we say or think can come to have content. I conclude by suggesting that Heidegger's "ontological foundations" of "the traditional conception of truth" can be seen as an attempt at solving a problem which Davidson recognizes but believes is incapable of solution-namely, the way the existence of language and thought presuppose our sharing a finely articulated structure which only language and thought seem capable of producing." p. 304

"This paper discusses Heidegger's 1931-32 lecture course on The Essence of Truth. It argues that Heidegger read Platonic

ideas, not only as stage-setting for the western philosophical tradition's privileging of conceptualization over practice, and its correlative treatment of truth as correctness, but also as an early attempt to work through truth as the fundamental experience of unhiddenness. Wrathall shows how several of Heidegger's more-famous claims about truth, e.g. that propositional truth is grounded in truth as world-disclosure, and including Heidegger's critique of the self-evidence of truth as correspondence, are first revealed in a powerful (if iconoclastic) reading of Plato."

The Doctrine of Categories from an Historical Perspective

Introduction

"Metaphysics, in its minimal form, is the activity of categorial description. Its subject matter is the most fundamental aspects of the way we think about and talk about reality, the most fundamental features of reality as it presents itself to us. We divide the world into horses and trains, people and mountains, battles and towns, and a whole complex structure of different kinds of things; our language is the repository of this enormously rich furnishing of the world. But we can discern within this richness some overall divisions, between things and their properties for example, or between events and the times and places in which they happen, and it is with the overall pattern of our categorising of elements of the world that metaphysics concerns itself. The basic divisions which our thought and talk about reality entail are the quarry of categorial describers.

(...)

Aristotle's categories are 'predicables' because (with reservations to be looked at later) they are things predicated of something: when we say, for example, that 'Socrates is a man' we are predicating being a man of Socrates, i.e. a certain kind of substance. Again, when we say that 'Aristotle is in the Lyceum', we are predicating being in the Lyceum of Aristotle, i.e. a certain place, physical location. The ten predicables listed are the ten kinds of things that can be said of something. Now 'thing' is used here intentionally to convey the fact that Aristotle is, in the first place, talking about the world and not about language. It is being in the Lyceum as such that is predicated

or said of Aristotle, not the expression 'in the Lyceum' which is (if at all, and certainly in a different sense of 'said of') said of 'Aristotle' the name.

But 'thing' is used also to convey another fact about Aristotle's ten predicables, namely that the list involves a division into ten types or kinds of what can be variously called 'things', 'entities', 'existents' or 'beings'. Socrates is one kind of thing, a substance, and so is Aristotle; in-the-Lyceum is another kind of entity, a place or location; four-foot is a quantity; white is a quality; yesterday is a time; and so on. Aristotle, in drawing up a list of the ten different kinds of things predicable of something else, is drawing up a list of the ten different kinds of beings, entities, existents, or things. According to Aristotle we have to distinguish the categories of substance, place, time, quality, action and so on.

Now where does Aristotle get all this from, and is he right? (...)

How on earth could Aristotle have come up with this classification of things in existence in terms of ten categories? Clearly he did not engage in an empirical investigation of the things around him and arrive at his result as he would at a classification of species of animals or plants. The answer has to be that, insofar as the list is the product of investigation it was investigation of our thought and talk about the things which Aristotle could find around him. One commentator on Aristotle's list suggests that it was arrived at by distinguishing different questions which may be asked about something and noticing that ... only a limited range of answers can be appropriately given to any particular question. An answer to 'where?' could not serve as an answer to 'when?'. Greek has, as we have not, single-word interrogatives meaning 'of what quality?' and 'of what quantity?' ... and these, too, would normally collect answers from different ranges. (*)

Something along these lines has to be right, since Aristotle could not have investigated reality directly, and that for at least two reasons. One is that reality is not something which itself lies beyond or prior to our thought and talk about it in a way that allows of independent perusal, since reality is for us the very thing which our thought and talk concerns. If that looks tautological, let it be: a more substantial claim needs greater argument than I can offer now. The second

reason is that any perusal of reality would need to rest upon a way of classifying what is discovered in it: are we going to list places and times, qualities and numbers, relations and events? Well, that depends on the categories involved in our thought and talk. It is the very result of category division in our thinking and talking that the world divides up as it does. A way of putting this point is in terms of perception. To perceive the world is not, as a naive Lockean might think, to passively notice what is there; it is to conceptualise and hence pigeonhole what is there. And categories are the broadest, most fundamental and most general of our pigeonholing devices." (pp. 2-4)

Semantics and Ontological Analysis in Aristotle's *Categories*

Introduction

"The *Categories*, ascribed to Aristotle, has played a unique role in our tradition. It is the only philosophical treatise that has been the object of scholarly and philosophical attention continuously since the first century B.C., when people first began writing commentaries on classical philosophical texts. From early late antiquity until the early modern period, one would begin the study of Aristotle and the study of philosophy quite generally with the *Categories* and Porphyry's *Isagoge*. For several centuries, these two treaties, and the *De Interpretatione*, formed the core of the philosophical corpus which was still being seriously studied. Thus, it is hardly surprising that our received view of Aristotle -- whether we are aware of this in all its details or not -- was colored substantially by the *Categories*.

Already in late antiquity, however, doubts were raised about its authenticity, (1) though we know of no ancient scholar who, on the basis of such doubts, declared the treatise to be spurious. On the contrary, Ammonius claims that everyone agreed that it was authentic. (2) The writers of the Middle Ages and the scholastics of the early modern period seem to have had no doubt about the authenticity of the treatise; (3) presumably, they were relying mainly on the authority of Boethius. (4) It is tempting to suppose that this acceptance of the treatise by the scholastics is precisely what led Renaissance scholars like Luis Vives (5) and Francesco Patrizi (6) to raise doubts about this very foundation of both scholasticism and traditional logic, though they did not attempt to provide any detailed arguments for their conclusion. It remained for the nineteenth and

twentieth centuries to examine the *Categories* critically with the aid of the new philology. And soon enough, there was an impressive roster of those staunchly maintaining that the treatise was not genuine. (7) Even H. Bonitz considered it to be of doubtful authenticity. (8) During the present century, opinion has again shifted in favor of the view that it is a genuine work of Aristotle's, though, to be sure, the doubts have not been entirely silenced. I. M. Bochenski, writing in 1947, thought the treatise of doubtful authenticity; (9) and in 1949, S. Mansion tried to argue against its authenticity. (10) Doubts especially about the second part, the so-called *Postpraedicamenta*, have never really ceased. (11)

Given the enormous influence this treatise has had on our view of Aristotle and on our interpretation of his writings, it seems extremely important to me to try, as far as possible, to lay these doubts to rest. Yet, I hope this investigation will also be of interest to those already firmly convinced that the *Categories* is a genuine work of Aristotle's; for it raises questions that interpreters of the treatise, in general, do not address and whose answers might well alter the standard view of this text.

The question of authenticity, however, turns out to be crucially linked to the question of unity. Given that it seems highly questionable whether the *Postpraedicamenta* were originally part of the treatise or were appended by a later editor, (12) it might seem as if the question regarding the authenticity of the treatise needs to be asked as two questions, viz., questions regarding the authenticity of the first and second part individually. Many authors have indeed taken this for granted and have thus assumed that the first part was authentic, the second either probably or certainly not. (13) Since, however, interest traditionally has focused almost exclusively on the first part of this treatise, we also find the tendency to regard the question of authenticity as primarily the question of the authenticity of the first part and so to leave the question of unity and the problem of the authenticity of the second part to more or less take care of themselves. Buhle already exhibits this tendency characteristic of many modern interpreters.(14) After having called attention to the apparent lack of connection between the *Postpraedicamenta* and the *Praedicamenta* and after briefly remarking (without providing any specifics) that some things in the *Postpraedicamenta* do not mesh

well with other aspects of Aristotle's thought, he writes: "sed fac esse postpraedicamenta spuria, non idem tamen de *Categoriis* statuendum est." It is obvious -- as long as the authenticity of the first part is secure, it does not much matter to Buhle whether or not one considers the second part genuine. Such an approach, however, is methodologically highly suspect because the questions of unity and of authenticity cannot be separated without both prejudging the issue of unity and presupposing a certain interpretation of the Categories, especially since the lack of unity itself has been taken as providing strong prima fade grounds for judging the treatise to be spurious. (15) Therefore, in what follows, I will pay particular attention to the question of unity. The dangerous tendency to consider this treatise almost exclusively with reference to the first part and thus to jeopardize the status of the second part is, of course, reinforced considerably by the title. Hence. I will also discuss the title in connection with the question of unity." (pp. 11-12)

From: Michael Frede, The Title, Unity, and Authenticity of the Aristotelian *Categories*. In *Essays in Ancient Philosophy*. Minneapolis: University of Minnesota Press 1987, pp. 11-28.

"There is a theory called the theory of categories which in a more or less developed form, with minor or major modifications, made its appearance first in a large number of Aristotelian writings and then, under the influence of these writings, came to be a standard part of traditional logic, a place it maintained with more or less success into the early part of this century, when it met the same fate as certain other parts of traditional logic.

There are lots of questions one may ask about this theory. Presumably not the most interesting question, but certainly one for which one would want to have an answer if one took an interest in the theory at all, is the following: What are categories? It turns out that this is a rather large and difficult question. And hence I want to restrict myself to the narrower and more modest question, What are categories in Aristotle?, hoping that a clarification of this question ultimately will help to clarify the more general questions. But even this narrower question turns out to be so complicated and controversial that I will be content if I can shed some light on the simple questions: What does the word "category" mean in Aristotle? What does Aristotle have in mind when he talks of "categories"?

Presumably it is generally agreed that Aristotle's doctrine of categories involves the assumption that there is some scheme of classification such that all there is, all entities, can be divided into a limited number of ultimate classes. But there is no agreement as to the basis and nature of this classification, nor is there an agreement as to how the categories themselves are related to these classes of entities. There is a general tendency among commentators to talk as if the categories just were these classes, but there is also the view that, though for each category there is a corresponding ultimate class of entities, the categories themselves are not to be identified with these classes. And there are various ways in which it could be true that the categories only correspond to, but are not identical with, these classes of entities. It might, e.g., be the case that the categories are not classes of entities but rather classes of expressions of a certain kind, expressions which we--following tradition--may call "categorematic." On this interpretation these categorematic expressions signify the various entities we classify under such headings as "substance," "quality," or "quantity." And in this case we have to ask whether the entities are classified according to a

classification of the categorematic expressions by which they are signified, or whether, the other way round, the expressions are classified according to the classification of the entities they signify. Or it might be thought that the categories are classes of only some categorematic expressions, namely, those which can occur as predicate-expressions. Or it might be the case that the categories themselves are not classes at all, neither of entities nor of expressions, but rather headings or labels or predicates which collect, or apply to, either entities or expressions, i.e., the category itself, strictly speaking would be a term like "substance" or "substance word." Or it might be the case that categories are neither classes nor terms but concepts. All these views have had their ardent supporters." (pp. 1-2)

From: Michael Frede, Categories in Aristotle. In Dominc O'Meara (ed.), *Studies in Aristotle*, Washington: Catholic University Press 1981, pp. 1-25. (Reprinted in: M. Frede, *Essays in Ancient Philosophy*, Minneapolis: University of Minnesota Press, pp. 29-48).

"The precise position to be assigned to the Categories in the Aristotelian system has always been somewhat of a puzzle. On the one hand, they seem to be worked into the warp of its texture, as in the classification of change, and Aristotle can argue from the premiss that they constitute an exhaustive division of the kinds of Being (*A. Pst*. I 22, 83b15). On the other hand, both in the completed scheme of his logic and in his constructive metaphysic they retire into the background, giving place to other notions, such as causation, change, actuality and potentiality. Investigation, has, moreover, been hampered, especially in Germany, by attempts to correlate them with the Kantian Categories, with which they have obvious points of contact. But Kant's formal a priori concepts by which the mind makes for itself a world, to use Mr Bosanquet's phrase, imply an attitude to knowledge and reality so utterly opposed to the Aristotelian that the comparison has tended to confusion rather than elucidation. Scholars now realise better that the Aristotelian Categories can only be understood in connexion with the problems of Aristotle's own age.

The best general account of the Categories known to me is that given by Maier, who accepts the interpretation of Apelt in its main lines,

correcting it in some important points. (1) It is the great merit of Apelt to have firmly grasped the principle that, whatever the applications to which Aristotle put the scheme of the Categories, it is primarily connected with the use of linguistic thought to make assertions about reality and hence with the proposition, the judgment as expressed in language. In details, I think, he is misled by the associations of post-Kantian logic, which prevent him from entering fully into the attitude adopted by the early Greek logic towards the fact of assertion.

In view of the undoubted fact that the scheme of the Categories follows the lines of Socratic-Platonic thought, Gercke's suggestion (2) is tempting that it originated in the Academy. Gercke, whose own view of the Categories is strongly coloured by Kantianism, relies almost entirely on the greater point given to the arguments in the Ethics against the Idea of the Good if we suppose them to accuse Plato of inconsistency with his own doctrine of the Categories. Except as supplementing strong independent evidence an argument of this kind carries no weight. The case is certainly weakened if it can be shown that Aristotle uses the Categories to solve a philosophical problem in explicit opposition to the solution offered by the Academy. This can be done, I think. In *Meta*. XIV 2, 1088b18 he sets the Categories against Platonist doctrine. He is criticising the indefinite dyad, and traces the origin of this conception to 'their old-fashioned way of setting problems': the Platonists found it necessary to attack the Parmenidean dictum and establish the existence of 'what is not' (cf. Plato, *Sophist* 237A, 256D). But how will this account for the plurality of being (for being means sometimes substance, sometimes that it is of a certain quality, and at other times the other categories: 1089a7)? In the corresponding passage of the *Physics* (I 2, 184b15 sqq.) Aristotle solves the Parmenidean difficulty through the multiplicity of the Categories (186a25), and alludes to the inadequacy of the Academic solution (187a1).

The inference to be drawn from these passages, in conjunction with the chapter in the Ethics on which Gercke relies, is the negative one that Plato and his successors in the Academy did not apply the scheme of the Categories to the fundamental philosophical questions of Being and Good. Positive evidence must be sought in another aspect of the doctrine. Now the *Topics* exhibits the Categories in

intimate association with dialectical logic. The work itself purports to codify methods in regular use but not hitherto systematically treated. That these methods were employed in the Academy is amply attested by the Platonic dialogues. (3) Further, as the *Topics* and particularly the *Sophistici Elenchi* show, they were developed in close connexion with the eristic logic of Antisthenes and the Megarians. This fact at once establishes a contact with the treatment of the problem 'one thing, many names' in Plato's *Sophist* (251A). This difficulty was removed by drawing a distinction between different kinds of being, and Aristotle himself regards it as finally disposed of by the doctrine of the Categories. That some of the kinds of being included in the scheme were already recognised in the Academy is plain. In the *Topics* relatives have a number of their own *topoi* and the varieties of relatives enumerated in the Categories follow closely on the lines of division in the *Charmides*. (4) Much of the matter of the *Topics* must have been common to Academy and Lyceum. But this is not to say that the Categories as a complete and exhaustive scheme belonged to the Academy. Eudemus tells us that Plato solved the difficulties of Lycophron and others by a dual distinction of being.

I shall accordingly assume in what follows that the scheme of the Categories was evolved in the course of efforts to establish a doctrine of judgment which should settle the difficulties raised by Megarian and other critics; that the application to the solution of the larger metaphysical problems was a later development; that the foundations of the scheme were laid in the Socratic tradition of the Academy; that the completed scheme is probably Aristotle's own; and that the original working out of the scheme did not contemplate extension beyond the metaphysics implied in predication to the more fundamental metaphysics of the First Philosophy. Hence we must look to the analysis of empirical propositions for the origin of the scheme.

Now if we examine the scheme itself, we find three aspects of it to have special significance:

(a) The first is the distinction between accidental predication (*kata sumbebékos*) and essential predication (*kath' hauto*). (5) What is musical may be literate, but only 'in virtue of something else' (*kat' allo*), viz.: qua Callias; Callias is literate essentially (*kath' hauton*).

This distinction provides the first condition of scientific predication, and is regarded as of fundamental importance by Aristotle, who prefaces his accounts of such notions as unity and being with references to the accidental uses of these terms (*Meta*. V 6, 1015b16; 7, 1017a7).

(b) Closely connected with the previous distinction is the doctrine that all the Categories (including substance as predicate) imply a subject (*hupokeimenon*), which is the point of real connexion between the predicates, and provides the basis of their coexistence. The Categories classify the many 'names' which we apply to the individual (e.g. a man, *Sophist*251A), and give expression to the fact that he does not lose his unity in the process.

(c) Furthermore, all direct relations of implication and incompatibility lie within the Categories severally. They are, so to say, independent variables. The relation of genus to species is everywhere confined within the limits of a category and so is the relation of contrary opposition. This suggests a close connexion with the Platonic division, which, as we know from the *Sophist* and the *Politicus* and from Aristotle, was so prominent in the Platonic conception of scientific method." (pp. 75-77)

Notes

(1) Heinrich Maier, *Die Syllogistik des Aristoteles,* 3 volumes, Tübingen, 1896-1900, vol. II, pp. 277 ff.; Otto Apelt, *Beitrage zur Geschichte der griechischen Philosophie,* Leipzig, 1891, pp. 106 ff.

(2) Alfred Gercke, Ursprung der aristotelischen Kategorien, Archiv fur Geschichte der Philosophie 4, 1891, pp. 424 ff.

(3) Analysis of the arguments in the *Charmides* shows that nearly all make use of *topoi* dealt with by Aristotle in the *Topics*.

(4) Cf. with *Cat*. 6a36 sqq., *Charmides*, 168A. The list in *Rep*. 437B is the same and in the same order.

(5) See the distinction of 'being *kata sumbébekos*' and 'being *kath' hauto*' (*Meta*. V 7, 1017a7 ff.). Apelt's equation of 'being *kath' hauto*' with 'being said in virtue of no combination' (op. cit. 117) is manifestly wrong. *Kath' ho* or *kath' hauto* means that the determination attaches to the subject in respect of the subject itself

and not in respect of the determination. See *kath' ho* and *kath' hauto*, *Meta*. V 18, 1022a14 ff.

The problem of the authenticity of the Categories

"The little treatise of Aristotle which stands at the head of the Organon has caused a great deal of difficulty to students, both ancient and modern. The bulk of the discussion has centred about the question of its place in the Organon and in Aristotle's system, and the character of the ten categories to which the greater part of the book is devoted. But there have been found also critics who expressed a doubt as to the authenticity of all or part of the treatise in question. To say nothing of the ancient commentators of Aristotle, the earliest attempt in modern times to cast a doubt on the genuineness of the work seems to be that of Spengel in *Münchener Gelehrte Anzeigen* (Vol. XX [1845], No. 5, pp. 41 sq.). He was followed by Prantl in *Zeitschrift für Altertumswissenschaft* (1846, p. 646), and in his *Geschichte der Logik* (I, p. go, n. 5), also by Valentinus Rose in *De Aristotelis librorum ordine et auctoritate* (p. 234 et seq.). Zeller, on the other hand (*Philosophie den Griechen*, 2nd ed., II, pt. a, p. 67, n. 1), decides in favour of the genuineness of the first part of the work, the *Categories* proper, and against the so--called *Postpredicamenta* from Chapter X to the end.

(...)

When we pass over to matters of doctrine, it si surprising how many points of contact there are between the two works [*Categories* and *Topics*]. I shall follow the *Categories* and point out the parallels in the *Topics*.

The homonyms, which are given a definition and an illustration in the beginning of the *Categories*, have a whole chapter devoted to them in the *Topics*, the fifteenth of the first book, where they are also called *pollachos legomena*. Of particular significance is 107a 18-20,

for in 20 we seem to have a direct allusion to the definition in the *Categories*. We must see, Aristotle says, if the genera designated by the given name are different and not subordinate to one another, (...) (which is therefore a homonym), for the definition of these genera as connected by the name is different (...). The greater space given to homonyms in the *Topics* is not due so much to a development in doctrine as to the necessities of the subject. The object of the *Topics* is a purely practical one, to provide the disputant with ready arguments properly pigeon-holed, and a single general definition of homonyms is not adapted to such use. We must needs go farther and show in what different special ways homonyms can be detected. The *Categories* have more the appearance of materials gathered in the shape of preliminary definitions of necessary concepts.
